Continue to propagate the different kinds of half-hardy and hardy ornamental plants, for turning out in the beds and borders next summer. I have already described some of the better kinds of Verbena, and it may be useful to follow this up with notices of other things which are well adapted for the same purpose. There are several varieties of Scarlet Pelargoniums, such as the Frogmore, which is a fine dwarf free-flowering kind; Basilisk, which has an excellent habit, and produces flowers of the most intense scarlet; and compactum, which sends out large spikes, and shows them well above the leaves—all well suited for the clumps or borders. A variety called the Shrubland Scarlet deserves a place in all gardens, either in the greenhouse or on the lawn; it grows taller than some of the other kinds, but the flower-stems are very large and striking. Besides these, there are some dwarf sorts with variegated leaves, which look rather pretty in a small clump; one of the best of these is called Mangles's. I was much pleased with the effect which a round clump of Scarlet Pelargoniums, planted in a particular way, produced in the garden at Bagshot Park, noticed in the last number; and as it would look extremely well when placed in a judicious part of the lawn of a small garden, preparations might be made now for having one next year. It is done by saving a few tall plants for the centre of the clump, and having some shorter ones for the outsides. When they are planted out, and have established themselves, the clump has the appearance of one plant forming an irregular cone. When the variety called compactum, which I have just noticed, is employed for this purpose, as it is at Bagshot Park, the effect is particularly good.

The varieties of Anagallis, or Pimpernel, are also very ornamental; the best are the large blue (cærúlea grandiflora), the flesh-coloured (cárnea), and the red-flowered, which is sometimes called Monelli major. Then there is the Alonsoa or Célsia, the Lantanas, the Heliotrope, Petúnias, Nierembérgias, and Sálvias, which all strike readily from cuttings, and give variety as well as beauty to a garden. Péntstemon gentianoides and the red-flowering variety are both valuable plants to the amateur, for they are nearly hardy, even in the coldest part of England. There is one thing connected with this beautiful plant which ought to be generally known, and that is, it is much more likely to stand the winter if it is not cut over in autumn. Many persons cut it over as they do other herbaceous plants, whenever the stems begin to look bad; and if it does not push again in spring, they imagine that the winter has killed it, when the fact is, they have done so themselves by improper treatment.

The alterations intended to be made in the winter or spring should be studied in many cases now, whilst the leaves are on the trees. In some gardens which are tastefully laid out, the removal of a single branch from a tree is sometimes attended with the best results; some beautiful scenery is probably brought into view and an idea of extent is given on which the eye rests with pleasure. All these things ought to be carefully studied for some time before the work begins, in order that what is done may be an improvement and not a mere alteration.—*R. F.*

HOME CORRESPONDENCE.

Manures.—The subject of preparing manures having for a considerable time past been freely discussed in the columns of your most useful and instructive Paper, as well as amongst the agriculturists at the late meeting, where it was a leading topic, I do not feel quite satisfied with the modes recommended for what is termed "fixing" the ammonia developed during the process of decomposition. Sulphate of lime and sulphate of iron have been pointed out as most eligible for the purpose; but both are liable to objection, if not inapplicable altogether. Sulphate of lime, or gypsum, is not soluble in less than 500 parts of water, consequently cannot readily nor equally diffuse itself through the fermenting mass of manure, so as to unite with the ammonia and form a sulphate; which is what I suppose is meant by "fixing." But it is well known that the affinity of sulphuric acid for lime is much stronger than for ammonia. If the ammonia be in a gaseous state (which the readiness with which it is detected by smell plainly indicates), or if it be simply dissolved in water, no union with the sulphuric acid of the gypsum can take place. A portion of the ammonia *may* unite with carbonic acid gas, forming a carbonate, in which case a combination with the sulphuric acid may be made by means of compound affinity; but in no other case, that I am aware of. Sulphate of iron is, I apprehend, liable to the same objections; but there is another,—if the acid unites with the ammonia by simple elective affinity, the *protoxide* of iron will be liberated; and Professor Sprengel says "it is this protoxide which produces the harshness or acrimony which is so distinctly perceptible in some sorts of mould." He also observes, "My own experience has taught me that a field may be spoiled for several years if such sort of mould [that containing protoxide of iron] be not left on the surface for one whole year at least." This seems decisive against sulphate of iron as a "fixer;" but *if it be necessary* to convert the ammonia into a sulphate (which I am disposed to doubt), a far better and cheaper plan would be to use very dilute sulphuric acid for watering the soil-heap, which would thus be so perfectly diffused through the mass as to arrest every atom of ammonia. Sulphuric acid, at the manufactory, costs about 1¼*d.* per lb., or less than 2*s.* per gallon, which is cheaper than copperas at 5*s.*; two gallons and a half of oil of vitriol, costing 5*s.*, contain the same quantity of dry acid as 130 lbs. of sulphate of iron, which costs 5*s.* 10*d.* As to gypsum, its insolubility and inapplicability in a state of powder, with the expense of reducing it to that state, appear to me decisive against its use.—*Lusor.*—[We fully agree with "Lusor" that sulphuric acid is better than any other substance for fixing ammonia, and have several times recommended it for that purpose. With regard to the action of gypsum on manure, it must be remembered that manure contains carbonate of ammonia, and but little caustic ammonia; and when a solution of that salt is mixed with powdered gypsum, the two salts mutually decompose each other, even though very little of the gypsum is dissolved. Sulphate of iron is decomposed both by caustic ammonia and its carbonate. It is stated by several persons that they have advantageously used it to fix ammonia; an interesting account was given in March last, p. 191 of the *Chronicle*, of the use of this salt and of gypsum by M. Schattenmann.—*E.*]

Gardeners and Weeds.—I consider it a part of the duty of an intelligent gardener to be always improving his mind, and to be adding, day by day, something, however trifling, to his stock of knowledge. Amongst other means of acquiring information on doubtful points, the pages of the *Gardeners' Chronicle* stand pre-eminent; but the operative sometimes fears, that the source from which he gains amusement may be to him also a source of vexation. Some persons say you are not impartial, that you lean to the employer more than to the employed. Whilst the journeyman is conning over your pages, in a (too often) miserable bothy, the head-gardener is perusing the remarks of his more favoured brethren, and the gentleman may be glancing over your leading article. The latter reads your observations respecting troublesome weeds in an advanced state, namely, that "in a well-kept garden they are unknown." Perhaps the next day he finds a few in some part of his garden; it is true he cannot complain of his flower parterres, for there each plant luxuriates in its assigned place, and no other species are allowed to vegetate with it; his walks and lawns are in high keeping, and there is nothing slovenly in the immediate vicinity of the house; but some obscure corners of the kitchen-garden are, perhaps, "discreditable." Allow me then to ask, whose fault is this? whether that of the possessor of thousands, or of the toil and care-worn gardener? If the latter, let me plead for him. I am not particularly interested in these remarks, further than in sympathising with kind and intelligent, yet, in many respects, *ill-used gardeners.* Condemn no man unheard; but let us sometimes take a peep behind the scenes, and observe the causes and corresponding effects produced, directly and indirectly, by their operating unfavourably on the minds of all. A gardener's is an anxious life; he has to cater for his employers, and not unfrequently, with means very inadequate to the task assigned to him, he is expected to find certain things, both in and out of season, and when blamed he must not make frivolous excuses. But why should a good servant be pressed hard? a worthy gardener who has a kind master feels a pleasure in anticipating his employer's wishes. Perhaps the following statement will go a little way to show that he should not be blamed alone, if at all. The quantity and quality of work done in a garden depend much on the activity of the men, and the interest they take in the appearance of it; but, owing to a variety of causes, it is seldom they care anything about its general appearance. Few, very few gardeners have a sufficiency of hands to enable them to keep pace with the work in the busy months of summer; and unforeseen circumstances frequently retard necessary work for days, or even weeks; and sometimes the permanant number of hands does not exceed two-thirds of what are really necessary to preserve neatness. I would wish a due regard to be paid to economy; before it everything must bow: it forms a necessary part of a gardener's qualifications. To his professional eye a weed is as hateful as a cobweb would be in his cottage; yet their destruction is more expensive than is often thought. Allowing, then, the industrious gardener to employ his own time, and that of his men, to the best possible advantage, in few instances can he do all he would wish. On a fine hot day he may destroy myriads of weeds, by putting all hands to a general Dutch hoeing, just as these weeds are rising from the ground; and the services of women and boys as auxiliaries to the foreman and hands would be exceedingly useful: but too often infirm old men or boys are kept for charity, and gardeners suffer for it. These are reckoned as so many hands, whereas some are no better than fractions. I have put together these few desultory remarks, and I hope that your pages may be the means of establishing harmony between gardeners and their employers, by showing the former what is required, and the latter the difficulties with which the gardener has to contend.—*A Gardener, Isleworth.*

On making Lime-ash Floors.—Procure a quantity of lime-ashes (that is, the refuse of the limekiln, consisting of the smaller particles of lime, and the ashes of the culm or coal used in burning), and rather more than an equal proportion of gravel; both of which should be sifted separately through a quarter-inch sieve, to prevent, in some measure, the lime from blistering, and the gravel, if coarse, from forming a rough face to the floor. The smaller particles of gravel should afterwards be separated by a finer sieve; because if these were allowed to remain, they would make the substance too brittle. The whole must be well tempered with water, till it is of the consistence of stiff mortar, and must be allowed to lie in a heap for a week; at the end of which time it must again be well incorporated, and it will then be ready for use. If the ground is damp on which the floor is to be formed, it should have a coating of smith's cinders or some other porous material spread over it a few inches deep. When so prepared, lay on the mixture in sufficient quantity to be, when levelled, from four to six inches thick; allowing it to remain in a rough state about 24 hours. On the following day tread it well with shoes in which there are no nails; smooth it with a trowel, and afterwards beat it twice a day with a common rammer, until it seems to be consolidated, which will be the case in about seven or eight days. This can be easily ascertained by its moving in patches when struck with the beater; all that it requires afterwards is to render the surface perfectly level.—*Devonian.*

Impure Water.—I would be much obliged for information with regard to a tank which we have had built, about a year and a half ago, for holding 300 hogsheads of rain-water, for the gardens and laundry. I was obliged to discontinue the watering of plants with it, otherwise I should have killed them; it turns the cloths yellow. The water is strong enough to kill worms; it has been about seven times pumped out, but it is still as strong of lime as ever. The quantity of lime used in the mason-work was 200 bushels, 70lb. weight per bushel. We have been recommended to wash the inside with blood from the slaughter-house; also to plaster it with Roman cement.—*C.* [There is great difference in the quality of lime; some is far better than others for tanks and similar works. If, as is probable, "C." has employed bad lime, his best remedy will certainly be Roman cement, which is altogether the best possible material for lining tanks. Asphalte has been recommended by some, and appears to answer well. "C." should have stated how the rain-water is collected for his tank, and also the substance of which the walls of the tank are constructed; in the absence of more precise data, a thin coat of Roman cement appears the best means of preventing the water dissolving lime.—*E.* What is blood to do?]

Transmission of Cuttings to Foreign Parts.—I observe in a late Number of the *Chronicle*, that several methods of packing cuttings for transmission to foreign parts have been resorted to, but that none of them succeeded perfectly. I attribute the withered state in which they arrived to the want of moisture, and I think it might be remedied by plunging the ends of the shoots in potatoes; which latter might be afterwards plunged in a solution of cobbler's wax. This would, perhaps, be no superfluous caution, since it would fill up all interstices between the shoots and the tubers, and thereby prevent the ingress of air. The whole might afterwards be enveloped in India-rubber cloth.—*L. S., Chatsworth.*

On the probability of Flowering Plants in the Autumn.—Amongst the various improvements which have within the last few years been effected in horticulture, it is a matter of surprise, that, while so many different methods have been pursued in accelerating the flowering of plants, no attempt has yet been made to retard that period beyond the ordinary season appointed them by Nature. Surely the latter is equally as deserving of the consideration of the horticulturist as the former,—since, during the gayest summer months, by far the greater portion of the higher classes, who take an unbounded interest in flowers, and upon whom the gardener must in a great measure rely for his success in life, are absent from the country, and return only when their greenhouses, comparatively speaking, contain but a small source of attraction. It is true the many splendid varieties of Chrysanthemum which have been lately raised come naturally into flower during the otherwise dull autumnal months; still there is not that general appearance of gaiety which is observable at an earlier period of the year. The dazzling display of Azaleas and Pelargoniums, the delicate yet not less interesting flowers of the Hyacinth and Narcissus, are no longer to be met with, and nature appears, within and without, to be sinking into a state of rest. The question is, then, whether it is possible to prevent the flowering of spring plants at their appointed season, and to bring them into bloom between the months of August and December, and what are the most probable means by which it may be effected? whether by nipping off the flower-buds as they successively appear, or by the decrease of temperature? The latter treatment would, perhaps, be applicable to bulbous, the former to herbaceous and shrubby plants. For example, suppose that the flower-buds of a Rose were pinched off as they appeared; each shoot so checked would undoubtedly give birth to others, which would produce fresh flower-buds, and these in their turn might be stopped also. What would be the result of such treatment? Is it not probable that, by due attention to pot-room and watering, an abundant bloom might be expected, while those which had been left to a state of nature would long before have faded? And, if such should prove the case with the Rose, might not the same be looked for from the Pelargonium, Calceolaria, and numerous other favourite plants? It can hardly be doubted that the Camellia might be flowered at any period of the year, by varying the temperature according as circumstances would require. Again, let us suppose that a Hyacinth, or other bulb, was placed in an icehouse, or indeed in any situation where a regularly cool temperature was observed; would not its period of rest be prolonged—and this without endangering its safety by either damp or decay? Or if the pots containing the bulbs of the Amaryllis, during what would otherwise be their growing season, were kept dry, and in a cool situation, would not their time of flowering be also delayed? This is a subject which, at all events, is well deserving the attention of the gardener; and although many of the ideas here advanced may prove to be fallacious, still their very failure may be the means of leading him to future discoveries; and should success crown his efforts, the sober garb of autumn would be exchanged for the smiling livery of spring, and it would show how far nature might be rendered subservient to art in the field of horticulture.—*Inquirens.*

Growth of Plants in Charcoal.—Amongst your miscellaneous articles of last week, mention is made of some experiments upon the growth of plants in charcoal, the good effect of which is attributed to its property of being a conductor and retainer of heat. This is rather an ambiguous expression. Charcoal certainly is not a conductor of heat, but, like all such bodies, when once heated, it parts with its caloric very slowly, and in this sense may be said to retain heat. I apprehend that the true cause of its good effect on the growth of plants, is owing to its being a non-conductor of heat. It is well known that metallic bodies are excellent conductors of heat, and supposing that iron filings were mixed with the compost used in potting any particular plant, the effect of such a mixture would be that of abstracting the heat not only from the soil, but also from the water poured into it from time to time. It would, likewise, by its coldness, paralyse (if I may use the expression) the roots of the plant when they came in contact with it. This may be further explained, by supposing a person to lay one hand upon a piece of iron, and the other upon wood: the first will feel cold by the abstraction of heat from the hand; the other, being a non-conductor of heat, produces no such sensation. Charcoal, if used in a finely-granulated state, *and free from* DUST, will, I have no doubt, be found much superior to sand, for striking and other purposes. When in this state water will freely percolate through it; but if the dust be left in it, the water will become stagnant. Earthy substances (sand, for instance) are better conductors of heat than charcoal, and on that account, I should say, less suitable for the propagation of plants of tender habits.—*Henry Liddell.*—[The article alluded to was copied, as we stated, from "Hovey's Magazine of Horticulture."]

Ipomœa Learii.—Last autumn several small plants of this beautiful climber were given me, and upon one or two of them I found seed-vessels containing perfect seeds. The plants were in 48-sized pots, and in an unhealthy state. This is the only instance I have known of its producing seed. I have observed unhealthy plants of other tribes, when grown in small pots, to produce seed, while those in a vigorous state of growth did not. Is this a fact generally known? I, like Mr. Hodson, turned out a small spring-struck plant against a south wall, towards the latter end of June; it is now beginning to flower, and is covered with blossom-buds; it is the most healthy and vigorous plant I ever saw.—*Henry Oyer, Rosehill Gardens, Robert's-bridge, Sussex.*

The Ethiopian Arum.—There is, I find, generally a great deficiency in the summer treatment of the interesting Calla æthiópica (Richárdia africana), although it has been cultivated in this country above a hundred years. It requires very nearly the same treatment as the Iris chinensis, namely, shaking it frequently out of the exhausted soil, and divesting it of every appearance of suckers, trimming in the roots, and repotting it, but not to excess. It is best to return them into the same pot, unless it be obvious that more room would increase their luxuriance. With rich compost they will be strong and healthy by the regular flowering season, and will send up strong stems, blooming in a continued succession nearly throughout the winter. I find that, like all tuberous and bulbous-rooted plants, they do better when suffered to remain in the pot for a time in a dormant state, after they have done flowering, keeping them only slightly moist. They should afterwards be shaken out of the soil, the roots and suckers trimmed from the tubers, and treated as before. Although winter is the flowering season, I have had them blooming in a continued succession through the summer months, in the stove. They soon get vigorous roots, and send up another, and often three or four flowering stems, if the tuber is strong. They will flower well in the open ground in summer, and produce a fine effect; although their most natural season, like the Chinese Iris, is in the winter months, when their elegance and pleasing fragrance are most wanted.—*J. Mearns, F. H. S., Leeds Bot. Garden.*

Frogmore Scarlet Pelargonium.—As this is a plant comparatively little grown to what it ought to be—and as many people complain of the difficulty they find in increasing it in the autumn, I shall relate a very simple, and at the same time effectual, method of propagating it. I put together a quantity of well-fermented dung, and place a frame upon it; I then cover the surface of the hotbed with sandy heath mould, to the depth of four inches, in which I insert the cuttings, but do not water them; I keep the lights on by day and off during the night (excepting it rains), without any shading. This is continued for more than a week; and on the third week from the time the cuttings were put in, water may be given, and the lights may be kept close without shading. On the fourth week the cuttings will be rooted, when they may be potted off in the manner most convenient. What I have noticed to result from watering cuttings, when just put in, is this—the heat in driving off the water also hastens the dissolution of the cutting, at the surface of the bed; but if prepared as I have stated, no such effect will be produced. Keeping these remarks in view, in connexion with what Mr. Beaton has said, in No. 34, p. 558, a more sure way of propagating plants will be arrived at.—*C.*

Canker in Fruit-trees.—It is at this period of the year that canker generally makes its appearance (if it has not at an earlier period) among the Cucumbers and Melons. I beg, therefore, to offer a few remarks, which may tend in some degree to obviate that destructive disease. It is a too frequent practice among gardeners, when pruning or thinning their Cucumbers, Melons, &c., to cut the petiole or leaf-stalk of a decayed leaf, at a considerable distance from its base or union with the stem, sometimes through a portion of the leaf. Such being the case, the part left above the joint of the stem commences immediately to decay; this gradually descends to the joint, and is at once the seat of canker. I would recommend them to cut off the leaves as close as possible to the base, without direct injury to its joint. Those who act otherwise, may depend upon it they will never be free from canker, because they run headlong into the disease. The above is carried on to a great extent, I am sorry to see, even among those considered to be first-rate practitioners.—*Surreyensis.*

Apple Trees and Rabbits.—I have lost many fine Apple trees from their being decorticated by rabbits, and mean to adopt the application of coal tar to the stems of the rest as a prevention of their devastation. I was afraid that such an application might injure the tree, but I have since had sufficient evidence to convince me that it has no injurious effect whatever.—*J. Murray.*

The Robinia Pseud-Acacia.—Allow me to state for the information of those who may be induced to plant the Robinia pseud-Acacia, with the view of raising timber, what has been my own experience with respect to two or three plants of this tree. From the time they had overtopped the neighbouring dwarf shrubs, and when in leaf, the branches were repeatedly split by even moderate winds; but when about eighteen feet high, a strong limb was blown from the bole of one of them, leaving a wound evidently calculated to weaken the main stem. Shortly after, another branch shared the same fate; and, as I anticipated, at one of those wounds it was broken off; and with the top my hope of timber fell to the ground. Another fine tree suffered in the same way, several smaller ones were considerably injured, and the whole were rooted up. Part of them were made into nursery-labels, which were durable, but were found to stain the white lead, and obliterate the writing. The situation was by no means exposed to violent winds; and I am not aware that any system of pruning (for pruning was at that period tolerated) would have been the means of saving the trees. The Robinia about that time was strongly recommended to be planted for timber; but the impression upon my mind from the above, and from several other circumstances, is, that a plantation of this sort, in the course of a few years' growth, may haply present to the proprietor on some occasion something of the effects of a tornado having crossed through it.—*W. Godsall, Hereford.*

Chamomile.—Without saying anything for or against the curative effects of Chamomile, I may state a circumstance or two which have come under my notice. When in Ireland some years back, on calling upon Mr. Christie, then gardener to the Duke of Leinster, at Carton, he pointed out two Peach-trees, on an east aspect, which he said for years had been infested with mildew; but, at the suggestion of a friend, he had planted Chamomile at the base of the wall. At the time I saw them, the trees were as clean as they could be. While at Soham, the Rev. J. Calthrop, of Isleham, an enthusiastic amateur gardener, related an instance to me of a friend who had cleared his Peach-trees of mildew in the same manner. It is but justice to say, Mr. Calthrop had but little faith in the Chamomile, though he could vouch for the disappearance of the disease from his friend's garden. For my own part, to use a familiar phrase, I have always regarded it as an old woman's story; I however "tell the tale as 'twere told to me." But Mr. Alexander, who is now at Carton, can perhaps "illuminate" us a little on the subject.—*W. P. Ayres.*

Cauliflowers as a useful Vegetable to Cottagers.—There are few persons who have eaten of well-grown and well-cooked Cauliflowers, but will be ready to acknowledge, with Dr. Johnson, that they are among the best flowers that the garden produces; but it is a general belief among cottagers, that the crop is not so profitable as some others that can be grown in their gardens. I may possibly be able to show, that a small spot of garden ground may be made to produce a profitable return with a crop of those vegetables grown upon it, if the cottager could manage to preserve through the winter three dozen of young Cauliflower plants, which may be done with a small bottomless box over them, having two or three panes of glass in the cover of it. Let him take about 12 square yards of ground for growing his crop of Cauliflowers, and when the time arrives for putting them out, he may plant 30 of his plants upon the ground set apart for that purpose, and those that remain may be useful to supply the place of any that may fail. After they are planted, particular attention must be paid to hoeing between them frequently, and watering them with soap-suds and urine, diluted with water. The latter should be done once a week, as long as it can be applied without injury to the leaves. The cottager should endeavour to keep up an army of reserve, consisting of spring-sown plants; and as soon as the first heads fall by the strokes of the "lang kail gully," the roots and leaves ought not to remain (as is often done), but should be taken away, and made the most of. Those cottagers who have pigs may take the leaves, and that part of the stem called in Scotland the costock, and mince it along with the leaves; if there are a few small potatoes, and a little salt, to add to them, so much the better. The animal will express its thankfulness for the kindness done to it, by showing how quickly it can eat it up. The cottager, in the evening, should take his spade, and turn up the ground where the old plants were; and having given the earth a good soaking with water, he should afterwards put in young plants where the old ones came out, and continue in this manner until all the first-planted ones are taken away. After the ground is cleared of the first crop, and when a second has been put in, take a dung fork, and loosen the earth between the rows; continue the hoeing and manuring as before; and, in defiance of all that has been said concerning the evil effects of the excretions of plants upon others of the same species, by Macaire and many more, the cottager's wife may cut between 50 and 60 heads of good Cauliflowers, which, on an average, may be worth three halfpence per head, without taking into consideration the benefit which the pig has received. If he chooses to make use of them in his own family, he may have a dish of Cauliflowers every Sunday for dinner during six months.—*Peter Mackenzie.*

FOREIGN CORRESPONDENCE.

***Warpur.*—The kingdom of Warpur is situated upon** the left bank of the Niger, and is opposite to Iddah; it owes allegiance to the King of Benin, which place is reported by the natives to be many days' journey from Warpur. This tribe pay more attention to the cultivation of their farms than any others that I met with. Many of the farms are of great extent, and are kept remarkably clean. The principal object of cultivation is the Yam; and of this they have two species—Dioscórea alata and sativa. They are planted in rows of about five feet apart, and the same distance in the row. As the plants advance in growth, they are earthed up, and kept neatly fastened to stakes. The natives prepare this for food by roasting, and they flavour it with a species of Capsicum, which is found growing wild in great abundance. Two species of Ground-nut are also cultivated—the Arachis hypogæa, and africana; these are also earthed up similar to the Yams. Cassava is cultivated, and also found in a wild state; but it is very probable that the wild plants have escaped from the farms. Indian Corn and the Dhourra are, in the interior of the country, earthed up at the approach of the dry season. At this time (September 5th), the natives were very busy in performing this operation; but at the farms on the bank of the river, this earthing-up is dispensed with, drains being formed between the rows to carry off the superabundant water. I saw a species of Dolichos growing in a few places, but it does not appear to be generally cultivated. Goora Nuts are found in a wild state, and used to flavour their food. The Cola is here in as much repute as in any part of Africa that I have visited; but I believe it is not found growing at this part of the river, as the people, in answer to questions put to them, said they got it from the interior. Of fruits, they have Bananas, Plantains, Papaws, and Limes; but they are not plentiful. There is an indigenous fruit of the size of a Noblesse Peach, which is held in great estimation in the making of Palaver sauce. This is the name given to it by the liberated Africans, who speak the English language. The taste of this fruit is not pleasant to the European palate. A very prominent feature in the Flora of this part of the Niger is the disappearance of two hitherto plentiful genera, the Ferns and Orchidaceæ. Palms are more rare than they have been at any part up the river. I saw a few specimens of the Oil Palm, Elais guineensis, and Areca. The Cocoa-nut quite disappears. I saw some plants of this last-mentioned Palm about 30 miles below this point. The Sarcocephalus is very rare; I only met with one plant; though, up to this time, it has been met with in abundance. At this place, I had the opportunity to examine the lovely Spathodea campanulata; I had seen this plant before in the Delta, as we sailed through, but could not get to it; this was somewhat earlier. I also frequently met with a fine white-flowered Combretum, which appeared to be the Combretum micranthum. The stagnant water produces a species of Lemna, nearly resembling the Lemna minor of our own ponds. Cotton and Indigo are found growing wild, but neither seem to be applied to any use by the natives. The implement used by these simple people in preparing their farms for cropping is a rough-made hoe, with a handle about 18 inches long, with which they make holes, into which the seed is placed; and the same tool is used in clearing the land. Before leaving this place, I made up a collection of the seeds of vegetables and distributed them among the natives; and, from the industry exhibited by them, I have reason to suppose that they will not be neglected. Of the kindness of the King I cannot speak in terms too flattering; for he treated me with the utmost civility, and promised, that if I returned to his country, he would protect me, and render me every assistance in his power. He had heard of white men, but had not seen one before I visited him. The question, whether it was not some complaint that caused me to be white, was put to the interpreter several times by the people.—*J. A.*

PROCEEDINGS OF SOCIETIES.

BOTANICAL SOCIETY OF LONDON.

Sept. 2.—J. Reynolds, Esq., Treasurer, in the chair. The following donations were announced:—British plants from the President, from Mr. G. W. Francis, Mr. B. D. Wardale, Mr. T. Samson, and the Rev. T. Butler. Donations to the Library from the American Academy of Science, Philadelphia; the Egyptian Society, Prof. Meneghini, Mr. G. W. Francis, and Mr. S. P. Woodward. Mr. T. Twining, Jun., exhibited a large collection of cultivated specimens from Twickenham. A paper was read from Mr. R. S. Hill, being an "Inquiry into Vegetable Morphology." Morphology is that division of Botany which takes cognisance of the various changes which occur in the condition of the vegetable organs; both such as are normal—as the transmutation of leaves into the several floral organs,—and such as are abnormal, and occur only accidentally. Taking the above as the definition of the subject, we immediately see its divisibility into two heads; the first of which treats of regular metamorphoses, which are connected with the natural structure of all vegetables; while the second includes those irregular, or accidental metamorphoses, which result from an imperfect or redundant performance of the several changes, noticed under the first head. These last influence particular plants, or parts of plants, and occur only occasionally. To this division belong double and other monstrous flowers. The great principle of regular morphology is, that the various floral organs are but modifications of one common type, which is the leaf. Prof. Lindley endeavours to give to Linneus the credit of having been the author, or at least of having suggested the idea, of this great fundamental principle; and in proof of this opinion quotes passages from his "Systema Naturæ" and "Prolepsis Plantarum," in which the theory is imperfectly hinted at. At his suggestion, the subject does not appear to have been taken up; nor was it at all till Goëthe published, in 1770, his work on vegetable metamorphoses. By the appearance of this work, however, the attention of Botanists appears to have been roused to the subject, and the result of their investigations tended to confirm the correctness of his views, and the dream of the author of "Faust" was at length allowed its station in the science of Botany. Leaves are in many instances entirely wanting, or exist only in the degenerated forms of scales and spines; in these cases, there is hardly any part of a plant which is not capable of being modified and rendered fit for performing the functions of leaves. For this purpose we find the excessive development of the stem, which pervades the Cactaceous tribe; the stem is also furnished with leafy wings or expansions, which run down its sides, as is seen in Acácia alata, &c. The petiole, in the form of the Phyllódium, frequently takes upon itself the office of the leaf, as in most of the Acácias from New Holland. The same functions are frequently discharged by the peduncle, as in Ruscus, Asparagus, &c.; and this appears to be the true character of the leafy organs of Ferns, the true leaves of which exist in the degenerated form of scales, known by the name of ramenta. It was announced that the paper would be continued at the next meeting.—Mr. A. White laid before the Society a selection of the plants which he had found in the beginning of August last, between Whiting Bay, in the Isle of Arran, and the top of Goatfell. He made some observations on the mild climate of that sheltered coast, where, even during winter, as Dr. M'Naughton, in the New Statistical Account of Scotland, writes, "many of the plants of warmer regions stand the whole winter in the open air, in Mr. Paterson's garden at the Whitehouse, and in the Duke of Hamilton's, at Brodrick Castle." He referred to the Rev. D. Landsborough's list of the rarer plants found in Arran, and to Prof. Gardner, of Glasgow, having lately found the Funária Muhlenbérgii in tolerable plenty, when on a trip with Mr. Landsborough.—Mr. B. D. Wardale presented numerous specimens of Lastræa cristata (Presl), collected at Bawsey Bottom, near Lynn, Norfolk.

FLORICULTURAL SOCIETY.

Mr. Mauger in the chair. Mr. Wildman proposed last season, and drew up, some admirable forms for the purpose of ensuring a uniform and systematic judgment upon seedling florists' flowers. A trial was made of the form proposed for the Dahlia; and as it appears to work well, there is no doubt of its being brought into general operation at the ensuing meetings. The proposition always appeared to us a good one, and to combine the advantages of facility and precision; and if generally adopted will ensure a uniformity of opinion that would lead to very beneficial results. The form proposed for the Dahlia is drawn up in the following manner:—

DAHLIA.
Class ——
Name ——— **Exhibitor** ———
Petal { Shape ———
Petal { Substance ———
Petal { Arrangement ———
Colour ———
Eye ———
Depth ———
Size ———
Form ———
Class of Quality ——

The attention of the judges being thus directed to the essential points of the flower, a precise and careful examination of its properties must take place before the forms can be filled up. This will necessarily lead to a better and more careful system of judgment; and if adopted throughout the country, it would correct many errors, lessen the number of complaints, and greatly benefit Floriculture, by acting as a wholesome restraint upon those who are willing to send forth flowers *of first-rate quality* that are unworthy of cultivation.—The first competition for the prize offered by Mr. Wildman, for the best white seedling Dahlia raised in 1841, was advertised for decision this evening. The only Dahlia sent for the purpose was Bragg's Antagonist, which, being pronounced by the judges a first-class flower, became of course the winner at the first exhibition,—the terms of the advertisement requiring three contests to decide the prize. The remaining exhibitions will take place at Salthill, on the 16th, and at the Show of the Floricultural Society, on the 20th Sept. The Secretary's report of the proceedings was not received in sufficient time for preparation, previously to our paper going to press.

COUNTRY SHOWS.

Aberdeenshire Horticultural Society.—The fourth exhibition for the season was held in the East Gallery of the New Market Buildings. The award of prizes was as follows:—FUCHSIAS: 1, Geo. Cardno; 2 and 3, J. Booth. STOCKS: 1, F. Deans, gr., Union Grove; 2, N. Glennie, gr., Fintray; 3, J. Walker, gr., Grandhome House. COCKSCOMBS: 1, G. Cardno; 2, D. Gairns, gr., Glenbervie; 3, J. Wood, gr., Logie. CARNATIONS: 1, D. Gairns; 2, Alex. Mackie. *Seedling:* 1, C. Runcy, Esq.; 2, F. Deans; 3 and 4, T. Milne. PICOTEES: 1, J. Booth; 2, Alex. Mackie; 3, D. Gairns. DAHLIAS: 1, Alex. Mackie; 2, Alex. Brown, gr., Heathcot; 3, Alex. Mackie; 4, D. Gairns. *Seedling:* 1, F. Deans; 2, W. Riddel, gr., Blackford; 3, D. Gairns; 4, G. Gammell, gr., Kingcausie. ASTERS: 1, Alex. Forbes, Esq.; 2, 3, and 4, do. MARIGOLDS: 1, S. Farquhar, gr., Echt House; 2, Alex. Mackie; 3, R. Hardy, Links Gardens; 4, D. Gairns. HARDY ANNUALS: 1, N. Glennie; 2, J. Wood. HEATHS: W. Gallow. GRAPES: 1, J. Wood; 2, D. Gairns; 3, J. Esson. PEACHES: 1, N. Glennie; 2, G. Cardno; 3, N. Glennie. NECTARINES: 1, N. Glennie; 2, J. Dalgarno; 3, N. Glennie. MELON: 1, G. Rae; 2, J. Forbes, gr., Westhall; 3, G. Cardno. PEARS: 1, J. Esson; 2, D. Smith, gr., Aboyne Castle; 3, J. Leslie, Esq. APPLES: 1, S. Farquhar; 2, W. Smith, gr., Grandhome; 3, Alex. Brown. PEACHES *(from the open wall)*: R. Donald. PLUMS: S. Fernie, gr., Drum; 2, J. Wood; 3, N. Glennie. GOOSEBERRIES: 1, A. Reith, gr., Pitmuxton; 2, G. Anderson; 3 and 4, T. Robertson. 12 *Heaviest:* 1, G. Cardno; 2, T. Robertson; 3, N. Glennie; 4, G. Anderson. APRICOTS: 1 and 2, J. Wood; 3, N. Glennie. *Seedling Gooseberries*: 1, J. Pirie; 2, W. Chalmers. 12 GREENHOUSE PLANTS: 1, W. Joss; 2, Alex. Forbes, Esq.; 3, T. Darling. 6 *do.*: 1 and 2, R. Farquhar. ORNAMENTAL BORDER FLOWER: J. Forbes. The first *Extra Prize* was awarded to T. Darling, for a beautiful plant of *Hoya carnosa*; and the second to Mrs. Jopp, Elmhill, for a plant of *Impátiens glandulígera.*—*Aberdeen Journal.*

Dumfries Horticultural Society, July 16.—The Fifth Monthly meeting for the season was held in the Court House, Buccleuch Street. The attendance was good, and the specimens of flowers and fruits exhibited were highly creditable to all concerned. The following prizes were awarded.—PINKS: Mr. J. Moffat. ROSES: 1, Mr. Fergusson; 2, Mr. J. Moffat. *China*, Mr. O'Loughlin. STOCKS: Mr. Landsburgh. SALVIAS: Mr. O'Loughlin. FRENCH MARIGOLDS: Mr. J. Moffat. BEST COLLECTION OF CUT FLOWERS: Mr. Colquhoun. MELON: Mr. O'Loughlin. CHERRIES: 1, Mr. Johnston; 2, Mr O'Loughlin. A prize was also awarded to Mr. O'Loughlin for a very fine specimen of *Tropæolum pentaphyllum*; and to Dr. Harris for one of *Tillandsia repens.* Mr. Wells, gr. at the Woodlands, exhibited, but not for competition, a very fine *Melon* (Brown's Superb), weighing 10 lbs. 2 oz. Mr. Colquhoun exhibited *thirty varieties of Gooseberries*; and Mr. A. Dickson, jun., some *drawings of Pansies*, which were much admired.

Haresfield Horticultural Society, Aug. 11.—The following is a list of the prizes awarded to the subscribers:—FRUIT—*Apples:* 1, Mr. Jos. Chamberlayne; 2, Mr. C. Smith; 3, E. Boulton. *Apples of last year:* Extra prize, S. Smith. *Pears:* 1, Mr. Basham; 2, H. Bick; 3, Mr. P. Dowdeswell. *Plums:* Mr. M. Lewis. *White and Red Currants:* Mr. Basham. *Red and Green Gooseberries:* Mr. Basham. *Apricots:* 1, Mr. W. Beach; 2, Mr. Chamberlayne; 3, Mr. C. Chandler. *Cucumbers:* Mr. Basham. FLOWERS—*Dahlias:* 1 and 2, Mr. Basham. *Hollyhocks:* Mr. J. Long. *Pansies* (*seedlings*): 1, 2, and 3, Rev. A. Ely. *Double Stocks:* Jasper Coole. *Fuchsias:* 1, Mr. W. Copner; 2, C. Edwards; 3, C. Edwards. *Basket of Flowers:* 1, Mr. Basham; 2, J. Dunn. *Best Device:* J. Dunn. *Nosegay:* 1, H. Bick; 2, R. Vaughan. *Calceolaria* (*extra*): Mr. W. Copner. *Choice Flowers* (*extra*): Mr. White. Prizes were also liberally distributed amongst cottagers, for the best stocked and neatest Cottage Garden; for the neatest and cleanliest kept Labourer's Cottage; and for the best Flowers, Fruit, and Vegetables.—*Abridged from the Gloucestershire Chronicle.*

Hull Horticultural Society, August 30.—This exhibition took place in the Botanic Garden, and was numerously attended. The following is a list of the prizes awarded:—DAHLIAS: (*open to all*) *Stand of* 36 *blooms*, the silver cup, value 16 guineas, 1, Mr. T. Brown, Slough; 2, Mr. S. Widnall, Cambridge. *Stand of* 18 *blooms*, the silver cup, value 7*l*., Mr. T. Brown. *Gentlemen's gardeners, Stand of* 18 *blooms*, 1, 5*l*. presented by Mr. Widnall, of Cambridge, to S. Appleton, gr. to A. Terry, Esq.; 2, (by the society,) to W. Burnett, gr. to J. Buckle, Esq., 2*l*.; 3, to W. Kirkpatrick, gr. to J. S. Egginton, Esq., 1*l*. *Amateurs, Stand of* 18 *blooms*, 1, Rev. Lamplugh Hird; 2, Mr. W. Bores; 3, F. Hill, Esq. 12 *blooms*, the silver cup, presented by Mr. Brown,—the Rev. Lamplugh Hird: 2, Mr. H. S. Norman. *Open to all, Six blooms*, 1, Mr. T. Brown, Slough; 2, Mr. G. Edwards; 3, Rev. C. Hotham. *Best un-named Seedling*, 1841 or 1842, Mr. G. Edwards. STOVE PLANT: 1, Earl Yarborough, 2, R. F. Shawe, Esq. STOVE CREEPER: 1, Mrs. Anderson; 2, S. H. Eggington, Esq. CACTUS: 1, R. F. Shawe, Esq.; 2, R. Mansley, Esq. GREENHOUSE PLANT: 1, Mrs. Anderson; 2, A. Terry, Esq. CREEPER: 1, A. Terry, Esq.; 2, Mrs. Parker. ERICA: 1 and 2, R. F. Shawe, Esq. FUCHSIA: 1 and 2, R. Harrison, Esq. PELARGONIUMS: 1 and 2, Rev. E. L. Thoroton. CALCEOLARIA: *Shrubby*, 1 and 2, Sir C. Constable, Bart. *Herbaceous*, 1, Mrs. Anderson; 2, Sir T. A. Constable, Bart. DESIGN IN FLOWERS: 1, R. F. Shawe, Esq.; 2, R. Raikes, Esq.; 3, S. H. Egginton, Esq. COLLECTION OF ROSES: 1 and 2, Rev. C. Hotham. TWELVE CARNATIONS: 1 and 2, Messrs. B. Ely and Son. TWELVE PICOTEES: 1 and 2, Messrs. Ely and Son. STOCKS: 1, J. Hudson, Esq.; 2. T. Holderness, Esq. ASTERS: 1, Sir C. Constable, Bart.; 2, A. F. Reynolds, Esq. MARIGOLDS: *French*, 1, Sir C. Constable, Bart.; 2, Mr. J. Robson. *African*, 1, A. Jones, Esq.; 2, Sir C. Constable, Bart. PANSIES: *Twenty-four*, 1, Mr. H. Major; 2, Mr. W. Ward. *Twelve*, 1, Mr. H. Major; 2, Mr. J. Hodgson. EXTRA PRIZES: *Cactus*, Mr. J. Warrick. *Basket of Flowers*, T. Holderness, Esq. *Zinnias*, R. Raikes, Esq. *Cactus*, J. H. Galloway, Esq. *Greenhouse Plant*, T. Ward, Esq. FRUIT—PINE APPLE: 1, 2, and 3, Col. Beaumont. GRAPES: *Black*, 1 and 2, J. S. Egginton, Esq.; 3, Right Hon. Earl Yarborough. *White*, 1, J. S. Egginton, Esq.; 2, M. Wilson, Esq.; 3, J. S. Eggington, Esq. *Largest bunch*, M. Wilson, Esq. ORANGE TREE IN BEARING: 1, J. Gee, Esq.; 2, Mrs. Anderson. PLATE OF ORANGE FRUIT, *grown in England*, 1, Mrs. Wilson; 2, W. Voase, Esq.; 3, Mrs. Anderson. PEACHES: 1, Her Majesty the Queen Dowager; 2, Mrs. Anderson; 3, do. NECTARINES: 1, Mrs. Anderson; 2, do.; 3, Mr. C. Usher. APRICOTS: 1, Mrs. Anderson; 2, Hon. C. Langdale; 3, F. Wilkinson, Esq. MELONS, *for size*, 1, F. Wilkinson, Esq.; 2, R. Mansley, Esq.; 3, Right Hon. Earl Yarborough. *For flavour*, 1, S. H. Egginton, Esq.; 2, Earl Yarborough; 3, Mrs. Anderson. PLUMS: *Yellow*, 1, Hon. C. Langdale; 2, F. Hill, Esq.; 3, Her Majesty the Queen Dowager. *Green*, 1, J. Buckle, Esq.; 2, do.; 3, Her Majesty the Queen Dowager. *Dark*, 1, Mr. J. Summers; 2, Rev. L. Hird; 3, Her Majesty the Queen Dowager. PEARS: *Dessert*, 1, J. S. Egginton, Esq; 2, J. K. Cankrein, Esq.; 3, B. Haworth, Esq. APPLES: *Dessert*, 1, A. Jones, Esq.; 2, do.; 3, Earl Yarborough. *Baking*, 1, F. Wilkinson, Esq.; 2, Earl Yarborough; 3, A. Jones, Esq. CHERRIES: 1, H. Burton, Esq.; 2, Rev. C. Hotham; 3, Hon. C. Langdale. MULBERRIES: 1 and 2, J. Preston, Esq. GOOSEBERRIES: 1, Mr. J. Hodgson; 2, W. Voase, Esq. CURRANTS: *white*, 1, Hon. C. Langdale; 2, Col. Martin. *Red*, 1, J. Preston, Esq.: 2, Mr. J. Hodgson. FILBERTS: 1, B. Haworth, Esq.; 2, J. S. Egginton, Esq. NUTS: 1, A. F. Reynolds, Esq.; 2, Mr. J. Summers. FIGS: 1, Mrs. Anderson; 2, M. Wilson, Esq. VEGETABLES.—PEAS: 1, T. Holderness, Esq.; 2, R. Raikes, Esq. BEANS: 1, A. Jones, Esq.; 2, Col. Martin. SCARLET RUNNERS: 1, J. Preston, Esq.; 2, R. Raikes, Esq. FRENCH BEANS: 1, T. Ward, Esq.; 2, Mrs. Anderson. BEST CARROTS: 1, Sir C. Constable, Bart.; 2, Mr. T. Huzzard. SALSAFY: 1, C. Whitaker, Esq.; 2, A. Jones, Esq. SCORZONERA: 1, C. Whitaker, Esq.; 2, A. Terry, Esq. CABBAGE: *White*, 1, W. Stephenson (*weighing about three stone*); 2, J. Richardson. *Red*, do. ONIONS: 1, do.; 2, F. Wilkinson, Esq. SHALLOTS: 1, Mr. H. S. Norman; 2, F. Wilkinson, Esq. VEGETABLE MARROW: 1, Mr. J. Hodgson; 2, R. Raikes, Esq. CELERY: *Red*, 1, Mr. L. West: 2, Mr. G. Whiting; 3, Mr. T. P. Smithson. *White*, 1, R. F. Shawe, Esq. (*four heads of Seymour's superb white solid Celery, weighing* 23 *lbs*); 2, Mr. G. Whiting; 3, R. Raikes, Esq. LETTUCE: *Cabbage*, 1, C. Whitaker, Esq.; 2, J. Richardson. *Cos*, 1, C. Whitaker, Esq.; 2, Sir C. Constable, Bart. PARSLEY: 1, R. Harrison, Esq.; 2, M. Wilson, Esq. CUCUMBERS: 1, R. Raikes, Esq.; 2, F. Wilkinson, Esq.; 3, Mr. T. Huzzard. EXTRA PRIZES.—*Capsicum*, Earl Yarborough. *Beet*, 1, T. Ward, Esq.; 2, R. Manslep, Esq.—*From the Hull Rockingham Newspaper.*

Kelso Horticultural Society, July 13.—The third meeting for this season took place in the extensive nursery grounds of Mr. Lockie. The following is the award of the premiums: PINKS, *best nine*, Mr. Pillans; 2, Mr. Amour. *Best three seedlings*, 1, Mr. Dippie; 2, Mr. Brunlees. ROSES, *best six Garden*, Mr. Crichton; 2, Mr. Taylor. *Best six China*, P. Wilson, Esq.; 2, Mr. Scott. PELARGONIUMS, *best six varieties*—Beauty, Priory Queen, Erectum, Una, Alicia, and Joan of Arc, Mr. Crichton; 2—Victory, Masterpiece, Sylph, Gaines' King, Duchess of Roxburgh, and Maria, Mr. Pillans. *Best three seedlings*, Mr. Brunlees. FUCHSIAS, *best three*, Mr. Brunlees; 2, Mr. Crichton. FLOWERING SHRUBS, *best six varieties*, Mr. Cruickshanks; 2, Mr. Pillans. MAY-DUKE CHERRIES, *best pint*, Mr. Pillans; 2, Mr. Crichton. KEAN'S SEEDLING STRAWBERRIES, *best pint*, Mr. Pillans; 2, Mr. Cruickshanks. STRAWBERRIES, *best new sort*, Mr. Haig; 2, Mr. Pillans. MELON, *best-flavoured*, Mr. Pillans; 2, Mr. Amour. STOCKS, *best three double*, Mr. Cruickshanks; 2, Mr. Crichton. CAULIFLOWER, *best three heads*, Mr. Amour; 2, Mr. Cruickshanks. GREENHOUSE PLANTS, *best new variety*, Mr. Thompson; 2, Mr. Crichton. LETTUCE, *best six, two sorts, three of each*, Mr. Pillans; 2, Mr. Dippie. BOUQUET, Mr. Pillans. EXTRA PRIZE, Mr. Scott, for *Cockscombs.*—*Kelso Chronicle.*

Leamington Grand Dahlia Show.—The annual exhibition of Dahlias, &c., at Leamington Spa, took place on Monday and Tuesday last, the 5th and 6th inst., in the Royal Music Hall. In addition to a large collection of greenhouse plants in great luxuriance and variety, numerous devices of cut-flowers occupied appropriate situations; among these were a circular basket, resembling a target, a balloon, and car, formed entirely of Dahlias, and suspended from the lofty ceiling, with the letters V. R., composed of the same flowers and placed beneath the royal arms, and the words "Prosperity to Leamington," in large letters, also formed of Dahlias, and extending across the north end of the apartment in front of the organ-gallery, which was profusely wreathed with evergreens, and adorned with banners, &c. The first prize, a valuable and elegant *silver cup*, for DAHLIAS, *twenty-four blooms*, was adjudged to Messrs. Mayle and Co., of Lillington Nursery, who likewise obtained the premium for the best *seedling*, named Lord of the Isles. The second prize, for *twenty-four blooms*, was gained by Mr. Waterhouse, of Bedford. Mr. Kimberley, of Pinley, near Coventry, obtained the first prize for *twelve blooms*—with Annot Lyle, Nicholas Nickleby, Le Grand Baudine, Lewisham Rival, Duchess of Richmond, Indispensable, President of the West, Yellow Defiance, Conductor, Grace Darling, Rouge et Noire, and Countess of Pembroke; 2, Mr. Burbury—with Low's Duke of Cornwall, Conservative, Springfield Rival, Bedford Rival, Bloomsbury, Brown's Bridesmaid, Conductor, Maria, Hudson's Princess Royal, Girling's Indispensable, President of the West, and Dodd's Prince of Wales; 3, Messrs. Mayle and Co., not named. The first prize for *six blooms* was awarded to Mr. Kimberley, for Suffolk Hero, Grace Darling, Countess of Pembroke, Pickwick, Duchess of Richmond, and Unique; 2, Mr. Harris, for Widnall's Argo, Countess of Pembroke, Beauty of the Plain, Jeffrey's Climax, Pickwick, and President of the West; 3, Mr. Burbury, with Dodd's Prince of Wales, President of the West, Springfield Rival, Burnham Hero, Lewisham Rival, and Phenomenon. GREENHOUSE PLANTS: 1, Mr. Perkins; 2, Messrs. Mayle and Co. Best COLLECTION OF ROSES: 1, Mr. Perkins. PANSIES, *best* 24 *varieties*, 1, Mr. Burbury; 2, Mr. Perkins. COLLECTION OF ASTERS, 1, Mr. Cattell; 2, Mr. Perkins, to whom *extra prizes* were also adjudged for *Apples* and *Cucumbers.*

Sunderland Floral and Horticultural Society, Aug 18.—The third exhibition for the season took place in the Museum Room and Gallery of the Athenæum. The following is a list of the prizes awarded:—BEST COLLECTION OF FRUITS: 1, Mr. T. Cook, gr. to Sir H. Williamson; 2, Mr. J. Ross, gr. to R. Pemberton, Esq. MELON: 1, Mr. J. Clarke, gr. to J. Simpson, Esq.; 2, Mr. J. Clarke. GOOSEBERRIES: *Best-flavoured*, Mr. T. Cook. *Largest*, Mr. G. Allan. PEAS: *Knight's Tall Marrow*, Mr. G. Allan. CARROTS: Mr. J. Ross. CELERY: *Seymour's Superb White*, Mr. J. Ross. SALAD: Mr. R. Cloughton. FUCHSIA: Mr. T. Cook. *Best* 3, fulgens multiflora, grandiflora máxima, multiflora erecta, Mr. T. Cook. BEST 6 VERBENAS: Tweediana, melindres major, incisa, pulchella, Arraniana, teucrioides—Mr. G. Dale. *Best* 3, Tweediana, melindres major, incisa—Mr. G. Dale. BALSAM: Mr. T. Cook. *Best* 3, Mr. T. Cook. STOVE PLANT: Hibiscus Syriacus albo plenus, Mr. Dale, gr. to R. A. Davison, Esq. GREENHOUSE PLANTS: Siphocámpylus bicolor, Diplacus puniceus, Agapanthus umbellatus—Mr. T. Cook. 6 CARNATIONS: 1, Mr. Mallin; 2, Lady Howley, Butt's Lord Rodney, Wilson's William the Fourth, Pope's London Green, Don Juan, Watford Hero—Mr. T. Cook. *Best* 3, Pope's London Queen, Butt's Lord Rodney, Wilson's William the Fourth—Mr. T. Cook; 2, Miss Landers, Cook's Wellington, Sherwood's Corinthus—Mr. T. Hull. BEST CARNATION: Miss Landers—Mr. T. Hull; 2, Mr. J. Mallin. PICOTEES: 6, Gill's Enchantress, Master Campbell, Sharp's Beauty, Rosalie de Rohan, Pike's Defiance—Mr. I. Mallin; *Best* 3, Gill's Enchantress, Nestor, Dr. Horner—Mr. T. Cook; 2, Colonel Towers, Lamb's Defiance, Lamb's George Baker—Mr. T. Pattison. *Best Picotee*, Lamb's George Baker—Mr. T. Pattison; 2, Groom's Joan of Arc—Mr. T. Hull. CHINA ROSES: Mr. T. Pattison, gr. to Mr. Richardson: DAHLIAS: Grand Tournament, Duchess of Richmond, Grace Darling, Lee's Bloomsbury, Pickwick, Beauty of the Plain—Mr. G. Allan, gr. to W. R. Robinson, Esq.; 2, Beauty of the Plain, Lee's Bloomsbury, Hope, Grace Darling, Pickwick, Maria—Mr. G. Allan. GERMAN AND TEN-WEEK STOCKS: Mr. T. Pattison. BOUQUET OF PERENNIAL FLOWERS: Mr. R. Cloughton; 2, Mr. J. Ross. BOUQUET OF ANNUAL FLOWERS: Mr. G. Allan. FLORAL DEVICE: Mr. T. Pattison. The following prizes were awarded in addition to those offered in the list:—Mr. J. Ross, for 2 fine Queen Pine Apples. W. Featherstonhaugh, Esq., for 7 dishes of remarkably fine fruit, viz., Black Grapes, White Grapes, Apricots, Plums, Jargonelle Pears, Apples, &c. Rev. T. Baker, for Vallota purpúrea, beautifully bloomed; R. A. Davison, Esq., for a Vine in a pot, with 3 bunches of Grapes on it; Mr. T. Cook, for a Bouquet of select Flowers; Miss Wallace, for 3 dishes of fine Grapes; Dr. Young, for a collection of Salpiglossis; Mr. I. Mallin, for a collection of cut flowers, amongst which were Gladiolus ramosus and floribundus, Pentstemon gentianoides coccínea; Mr. G. Dale, for Cockscombs and Verbenas; H. Gibson and Son, for new Fúchsias, &c.—*Sunderland County Herald.*

Sandbach Floral and Horticultural Society, Aug. 30.—The second meeting for the season took place at the Town Hall, and was numerously attended. The collection of plants and flowers was good, and the fruits and vegetables were superior to any hitherto exhibited. The following is a statement of the prizes:—DAHLIAS: *Best Pan of twenty-four* (*Nurserymen*), Mr. S. Allcock. *Best Pan of twelve* (*Amateurs*), Mr. W. Latham. *Maroon*, 1, 2, 3, 4, Mr. J. Allcock; 5, Mr. Rowlandson, gr. to W. Davenport, Esq. *Rose*, 1 and 2, Mr. Rowlandson; 3 and 4, Mr. Faulkner; 5, Mr. J. Allcock. *Scarlet*, 1 and 2, Mr. Faulkner; 3, Mr. J. Allcock; 4 and 5, Mr. T. Pedley. *Tipped*, 1, Mr. Rowlandson; 2 and 4, Mr. Faulkner; 3, Mr. M. Reid; 5, Mr. S. Allcock. *Serfs*, 1, Mr. Rowlandson; 2, Mr. T. Pedley; 3 and 5, Mr. Faulkner; 4, Mr. W. Latham. STOVE PLANTS: 1, F. J. Ford, Esq.; 2 and 3, Miss Twemlow. GREENHOUSE PLANTS: 1, Mr. S. Allcock; 2 and 4, Miss Twemlow; 3, F. J. Ford, Esq. PELARGONIUMS: 1 (*Amateurs*), Miss Twemlow. 1 (*Gent. Gardeners*), Mr. T. Stringer. MISCELLANEOUS PLANTS: 1 and 5, Mr. T. Stringer; 2, Mr. G. Bayley; 3, Mr. W. Allcock; 4, Mr. S. Allcock; 6, Miss Twemlow. PANSIES: *Nurserymen*, 1, Mr. J. Allcock; 2, Mr. C. Taylor. *Amateurs*, 1, Mr. W. Latham; 2, Miss Twemlow. BOUQUET: 1, Mr. W. Latham; 2, Miss Twemlow; 3, J. Latham, Esq., M.D. EXTRA PRIZE: Miss Twemlow. FRUITS—PINES: Mr. Errington, gr. to Sir P. Egerton. GRAPES: 1, Mr. Errington; 2, Mr. Rowlandson. MELONS: Mr. Rowlandson. CUCUMBERS: *Nurserymen*, 1, Mr. Bishop; 2, Mr. Rowlandson. *Amateurs*, Mr. T. Stringer. PEACHES: Mr. Errington. NECTARINES: Mr. Rowlandson. APPLES: *Eating*, 1 and 2, Mr. Errington. *Baking*, 1, Mr. W. Allcock; 2, J. Plant, Esq. PEARS: 1, Mr. J. E. Williams; 2, Mr. G. Henshall. CHERRIES: 1, Mr. Errington; 2, Mr. J. E. Williams. PLUMS: 1, Mr. W. Allcock; 2, Mr. G. Bayley. POTATOES: *Kidney*, 1, Mr. T. Stringer; 2, Mr. Percival. *Round*, Mr. T. Stringer. RHUBARB: 1, Mr. Rowlandson; 2, Mr. G. Furnivall. CELERY: 1, Mr. G. Bayley; 2, J. Latham, Esq., M.D. ONIONS: 1, Mr. J. Allcock; 2, Miss Twemlow. CABBAGE: *Red*, J. Latham, Esq., M.D. CARROTS: Mr. J. Edwards. PARSNEPS: J. Latham, Esq., M.D. TURNIPS: Mr. Percival. LETTUCE: J. Latham, Esq., M.D. Numerous Cottagers' Prizes were also awarded.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

PEDICULARIS MEGALANTHA. Large flowered Lousewort. (*Hardy Herbaceous Plant.*) Scrophuláriaceæ. Didynámia Angiospérmia.—Rather a pretty herbaceous plant, with large yellow flowers, raised from Himalayan seeds sent to the Horticultural Society. The upper lip of the corolla is narrow, beaked, and half spirally twisted below the under lip, which is hooded, three-lobed, very deep yellow, with the side divisions rounded and emarginate, while the central division is inversely wedge-shaped. The flowers grow in long terminal spikes. The foliage, which is pinnatifid with narrow doubly dentate divisions, has a pallid hue, as if sickly; perhaps from its cultivation not being understood.—*Bot. Reg.*

ACHIMENES GRANDIFLORA. Large-flowered Achimenes. (*Stove Herbaceous Plant.*) Gesneráceæ. Didynámia Angiospérmia.—This is probably as fine a species as A. longiflora. A plant of it received by the Horticultural Society has Elm-like leaves covered with coarse hairs, ovate-oblong, serrated, larger on one side than the other, deep green above, and stained on the under side with blood-red veins. The flowers are of a rich violet purple, remarkably handsome, on a stalk as long as the petioles of the leaves. At the base they are very much saccate; the eye is white; and the tube is delicately powdered inside with purple. The whole length of the corolla is two inches; but it will probably be much larger.—*Bot. Reg.*

TRÓLLIUS ACAULIS. Stemless Globe-flower. (*Hardy Herbaceous Plant.*) Ranunculáceæ. Polyándria Polygýnia.—A singular little plant, raised in the garden of the Horticultural Society from seeds from the north of India. The flower is solitary, hardly elevated above the surface of the ground, and quite overtopped by the leaves. It has not the globose form of the other species, but expands its deep yellow sepals in a starry manner. The petals are deep orange colour; and the carpels are fifteen. It is not a very attractive plant, because its flowers are hidden among the leaves; were it not for that, it would be a rival to Eranthis hyemalis.—*Bot. Reg.*

MIMULUS MACLAINIANUS. Mr. Maclain's Monkey-flower. (*Half-hardy Herbaceous Plant.* Scrophulariáceæ. Didynámia Angiospermia.—This showy hybrid appears to have been raised by Mr. Maclain, florist, of Harold's Cross, near Dublin, between M. róseus and M. cardinalis; and it approaches more closely to the latter species than to any other known kind. Its habit, indeed, is the same, though perhaps a little more dwarf and compact. The flowers are, moreover, of a similar shape, varying somewhat in their degree of expansion, and in being occasionally broader, flatter, and less reflexed. The colours of the blossoms are extremely rich; and the throat, which has a hairy and velvety-looking surface, is of an exquisitely superb deep blood-coloured tint. It is probably more delicate than M. cardinalis, and perhaps the better plan would be to keep it in pots in the greenhouse. It should be grown in a rich loamy soil, placed in a pot of tolerably large size, and watered very liberally. It will be advisable to put the pot always in a pan of water. By taking away the offsets, which it produces abundantly, it may be readily multiplied.—*Paxton's Mag. of Botany.*

MISCELLANEOUS.

Experiments with Guano.—At a late meeting of the Isle of Man Agricultural Society, the following statement was read of some experiments which had been made with Guano, by Mr. Lyle, of the Kirk Onchan Nursery. On a light and poor soil were two plats of grass; one of Stickney's Rye-grass, mixed with small quantities of Holcus lanatus, and Poa trivialis; the other of Italian Rye-grass. A space was measured off from each of these patches, and on the 12th of May last both the spaces were topdressed with guano, at the rate of 3 cwt. per acre. On the 20th of June, one square yard of the dressed and undressed spaces, taken as fairly as possible, was cut and carefully weighed, when the following were the results: The produce from one square yard of Stickney's Rye-grass, dressed with guano at the above rate, weighed 7½ lbs.; while that which had not been so treated, weighed but 2¾ lbs. The Italian Rye-grass dressed with guano weighed 10¼ lbs.; whereas, that which had not received any weighed only 4¾ lbs. Guano was also applied on the 12th of May, at the same rate, to a row of young Elms; and on the 20th of June, this row could be distinguished, even at a considerable distance, from the others, by its deep and healthy green, and more vigorous growth. A row of Larches was dressed in a like manner with precisely similar effects, the neighbouring rows decidedly partaking of the benefit of the application. On a row of Strawberries, and upon those adjoining, effects similar to the last were produced. Guano has also been applied, after the above rate, to different kinds of Potatoes, to Swedish Turnips, to Mangel Wurzel, and other vegetables, in competition with dung. The growth produced by the former has, in all these cases, been exceedingly vigorous, but it is too early to give the complete comparative results. The extraordinary consequences of the experiments on the Grasses seem to leave little doubt of the excellence of guano as a topdressing for the general run of land under Grass for hay.

May's New late Victoria Red Currant.—We have received from Mr. May, of the Hope Nursery, Leaming-lane, near Bedale, Yorkshire, a branch of a new Red Currant under the above appellation, which promises to be a decided improvement upon the kinds generally cultivated. The specimen sent is loaded with racemes of fruit, many of them six inches in length, with berries of unusual size. The colour is bright, but the juice possesses much acidity, probably owing to the plant having been covered or grown in a shaded situation. It is very late, and its appearance is equal to that of Knight's Large Red.

The Potatoe in the East.—This valuable plant seems at length to have taken root in our Indian dominions. As good Potatoes are to be had in the Bazaar of Calcutta as in Covent-garden Market; Mr. Vigne says they were introduced by Baron Hugel into Kashmere and Little Tibet, where he saw them growing; and we learn from Dr. Royle, that Lieut. Cunningham, one of Lord Auckland's Aides de Camp, when he visited Kashmere, was treated with a curry of Potatoes.

Gardener's and Farmer's Foreign Library.—The following foreign works have been lately published:—Pabst, W.:—Verhandlungen. Transactions of the Meetings of the Baltic Association of Agriculturists and Farmers. Edited by —. Griefswald, 8vo.——Ungemach, P. Dr.:—Verhandlungen. Transactions of the Meetings of German Vinegrowers and Pomologists at Würzburg. Edited by —. Würzburg, 8vo, with a coloured plate.——Artur, J. F.:—Capillarité. Capillarity, Elements, Theory; followed by Applications to Chemistry and Organic Science. Paris, 8vo.——Laube, H.:—Jagd, Brevier. Breviary of the Forester. Leipzig, 8vo.——Bronner, J. P.:—Weinbau. The Wine-growing in the South of Germany. Heidelberg, 8vo, with plates.——Bronner, J. P.:—Schaumweine. The Sparkling Wines of Germany. Heidelberg, 8vo.——Brinken, J.:—Bewaldung. Treatise on the "Silvification" of the Steppes of European Russia, as a Rational Basis of the General Cultivation of Forests. Braunschweig, 4to, with plates and charts.——Gilly, D.:—Landbaukunst. Country Architecture, for Architects and Farmers. Braunschweig, 8vo, with plates, 4th edition.——Hartig, Th. Dr.:—Theorie. New Theory of the Fructification of Plants. Braunschweig, 4to.——Linke, G.:—Dächer. On the Building of Flat Roofs of Clay. Brunswick, 8vo, 2d edition.

The Assam Tea Plant.—We learn that the Agricultural Society of India, after having given their gold medal to Capt. Charlton, "as the first person to establish to the satisfaction of the Tea Committee and its secretary that the Tea-tree was indigenous in Assam," have also presented the same mark of honourable distinction to Major Jenkins, "for bringing to a successful result the inquiry in regard to the establishment of the Tea-plant in Assam." What if the Assam plant should not be Tea, that is, Chinese Tea, after all?

GARDEN MEMORANDA.

Hoddesden Hall, the residence of John Warner, Esq., is situated in the little town of Hoddesden, on the road leading from London to Hertford, and about one mile from the Broxbourne station of the Northern and Eastern Railway. The house is a square-built edifice of considerable size, with few or no architectural claims, but apparently replete with every domestic convenience. The principal or eastern entrance fronts the street; but from the south front a spacious lawn recedes, thickly and rather formally studded with flowering shrubs, trees, Roses, &c. From the lawn, and also from the windows of the sitting rooms, the spectator obtains an excellent view of a *jet d'eau*, rising to the height of forty feet, between two groups of trees, and falling upon a figure of Neptune, situated in a niche of rustic masonry at its base. This is a most beautiful spectacle from all parts of the grounds, but more especially from the terrace-walk, which extends nearly the whole length of the premises on the eastern side. From the terrace there is a view over a finely-wooded country; and from it we also behold a lake of several acres in extent, meandering through the valley, with its islands, rockwork, and aquatic birds playing their gambols in the limpid stream. Here, too, we perceive the extent of the pleasure-ground, which forms the boundary fence to the home premises. Leaving the terrace-walk at the south end, we proceed by a shady walk to the Rockery, which forms the head of the river. This rockery, to all appearance, consists of huge pieces of granite; but in reality it is composed of large blocks of artificial stone, formed of brick rubbish, cement, &c. Though completed only a few months, the stone had the appearance of having braved the storms of a thousand winters; and its manufacture, as well as the artistical disposition of the mass, reflects great credit upon the ingenuity and taste of Mr. Fulham, of Tottenham, the artist employed by Mr. Warner for its construction. What pleased us much in this rockwork was the admirable manner in which a table stone had been contrived and arranged for the water to meander over in its egress from the lake, and the eschewing of the monstrous practice of mixing three or four kinds of stone, and that too often without any reference to its stratification; at the same time wishing it to be considered a natural scene. Where in nature do we find more than one kind of stone in the same quarry?—then why should we in our imitations attempt more? Leaving the rockery, we proceed by the American garden lately planted, past the ruins of an old abbey, to the Rosary, Rose-bower, Bath-room, and small revolving fountain. The gradual manner in which the visitor is led from one scene to another in this walk is highly creditable to the designer of the place; for although we get a bird's-eye view of the principal attractions of the place from the terrace-walk, we are led so gradually from scene to scene, as to excite our attention sufficiently, yet not to disturb that repose which the mind delights in, and which is so indispensable to the proper appreciation of sylvan and floral scenery. Most of the best varieties of Roses are grown, and many of the kinds are trained over umbrella and other fancy trellises; but the one which pleased us most was a variety of Noisette, probably Aimée Vibert, the branches of which were trained over a barrel-shaped trellis, about three feet in diameter, and from five to six feet in height. The trellis covered the stem to within eighteen inches of the ground, and rose nearly three feet above the head of the plant; it was regularly covered with blooming wood, and literally one mass of bloom. A seedling climbing Rose, raised at this place, is worthy of a passing remark. The flower is of a delicate creamy white colour, with a slight tinge of sulphur towards the centre; the petals collapse as the flowers become expanded, thus giving it an unusual and unique appearance. In the bud and newly-expanded state, we do not know a variety so admirably adapted for a bouquet. The Bath-room and Engine-house is a Gothic structure, of a rather neat appearance. A few years back, the supply of water to this place was very limited; but on discovering a spring at the brow of a hill about a mile off, Mr. W. had it conveyed into the valley. It now supplies the fountains and the lakes; while the fall of the water works the engine to supply the house, garden, stables, &c. On leaving the Bath-room, we proceeded over a rustic bridge by the large fountain to the fruit and kitchen-garden. In this, there is a span-roofed house, containing a small collection of Orchidaceous plants, growing and looking remarkably well. In this house we noticed in flower, Vanda teres, Gongora atropúrpurea, and several Oncidiums; and the lovely little aquatic Limnócharis Humboldti was producing its delicate straw-coloured flowers in a small tub of water. Here, also, we saw, for the first time in flower, the gem of all late introductions, Achimenes longiflora, producing its blue petunia-like flowers; and well-grown plants of Gloxínia rubra, and several other varieties. Indeed, one plant of Gloxínia caulescens was the best-grown specimen we ever beheld; it had five stems, and could not have less than from twenty to thirty flowers expanded on each, giving an aggregate of upwards of a hundred flowers. In the frames and pits, we noticed handsome plants of Cockscombs, Balsams, Calceolárias, &c. Cucumbers on trellises doing well, and likewise Melons. The crops of vegetables and fruit were very good, but flowers are the leading feature of the place. In a flower-garden at the back of the mansion there is a small Vinery, with a tolerable crop of Grapes; a lofty conservatory, containing Orange trees and Camellias in fine health; and a small stove filled with various showy plants. In the conservatory, some specimens of Fuchsias were very properly elevated on single stages, placed among the other plants, so as to bring the flowers on a line with, or a little above, the level of the eye of the spectator. The pots in which the Fuchsias were growing, were plunged in larger ones; the outsides of which had been painted in fresco, which having a grey tinge, harmonised better with the flowers of the Fuchsias than the red brick earth of the common pots. In a conservatory adjoining the sitting-room, there were a very neat fountain and some good specimens of plants; but they were decidedly too much crowded—a fault unfortunately too common in most gardens. The flower-garden contained a fine bed of Bérberis glauca in full fruit, a clump of American plants, and some good specimens of Pæónia Moutan. Of the arrangement of the beds in this garden, we cannot say much in praise; they appeared to have been dropped "here and there as the maggot bites," without any connecting principle; and certainly without any design, except that of placing a bed on the grass. The distribution of the plants, &c., on the front lawn is also too formal; had they, instead of being distributed over the entire space, been collected into five or six groups, with broad glades of grass between them, we should have had a little light and shade in the picture, and the appearance of the place would have been much improved. We saw the grounds under rather disadvantageous circumstances; the dry weather having parched the grass up, and the garden men having been employed in the hay-field for some days prior to our call. On the whole, however, it was in very good keeping, and creditable to the skill of Mr. Williamson, the gardener. In a small field adjoining the road, Mr. W. had commenced a Pinetum, the plants in which were growing well.—*W. P. Ayres, June 18th.*

Young's Nursery, Milford, Godalming.—There is now in flower at this place the very rare shrub called Lavatera oblongifolia, a plant discovered by Mr. Barker Webb, in Spain, among Cisti; and also the Saviniona brachyloba, a rare Teneriffe herbaceous plant, with the aspect of Lavatera africana.

Rebiews.

The Quarterly Journal of Agriculture. No. 58. September, 1842. Blackwood.

This is a very important number of an important periodical; containing, as it does, several practical papers of great value, relating to some of the most essential operations of husbandry.

It is at least twenty-five years ago since the Norfolk farmers were told that they sustained great loss by allowing their wheat to become fully ripe before it was cut; and we ourselves saw beautiful samples at that time produced by cutting while the grain was still soft. The practice does not, however, seem to have spread as much as would have been expected; and shows in a striking manner how very difficult it is to induce farmers to alter their old habits, even when the advantage of doing so is beyond the reach of doubt. Let us hope that a paper upon the subject, by Mr. Hannam, will produce some effect. This gentleman has shown that at least six-and-twenty shillings an acre are lost by allowing wheat to become ripe before it is cut; and that, at the same time, its quality is deteriorated. He proves how this is by means of details, for which we have not room, but which he sums up as follows:—

"The following will therefore be as correct an approximation of the values of the acre cut at the times stated, as it is possible to come at:—

	£	s.	d.
No. 1, quite green	£11	17	0
No. 2, green	13	6	0
No. 3, raw	14	18	0
No. 4, not quite so raw . . .	14	17	4
No. 5, ripe	13	11	8

Showing a loss of 1*l.* 14*s.* 8*d.* per acre upon No. 1, as compared with No. 5; a loss of 5*s.* 8*d.* per acre upon No. 2, do. do.; and a gain of 1*l.* 6*s.* 4*d.* per acre upon No. 3, as compared with the ripe, and of 3*l.* 1*s.* per acre, as compared with the green cut, No. 1."

Is not, let us ask, that quality called steeliness by millers, which is observed in samples of Mediterranean wheat, owing to the excessive ripeness of the corn? The reason why a loss is incurred by allowing wheat to become quite ripe before it is cut, is thus explained by Dr. Madden, in another place in the present number:—

"The ripening of the seed, like all other processes in the vegetable economy, consists entirely of various chemical processes, whose nature I shall not at present attempt to explain, but whose results must be carefully considered in order to arrive at a conclusion, as to the modifying influence of different modes of culture. When the ear first fills, it appears composed almost entirely of a substance resembling *milk;* in about a fortnight after this, if we again examine the crop, we shall find the seed much more *solid*, the milky juice having hardened and consolidated, and the straw having begun to wither, which it always does from the ground to the ear. At this period the straw will be yellow for about a foot off the ground—in another fortnight the crop will be *perfectly ripe*, that is to say, the straw will be uniformly yellow *up to the ear*, and the chaff will be sufficiently loose to admit of the grain being *rubbed out* by the hands. On examining the ear, the most perceptible difference which has taken place since the last period is, that the skin has become much thicker and harder, while the flour has diminished in quantity. Now, this is the important point, viz., that the last change in the seed is an increase of bran, and a relative diminution of flour, which change increases materially, according to the length of time that elapses between the ripening and the harvesting of the crop."

To the other subjects treated of in the present number, especially the Preparation of Timber by Mr. Hyatt, Slit-Planting by Mr. Gorrie and Seed-Sowing by Dr. Madden, we shall advert hereafter. They all demand more space than we can devote to them at present.

CALENDAR OF OPERATIONS *for the ensuing week.*

The linings of Cucumber and Melon frames being now in a fit state for manure, they ought to be wheeled out, as Potato and other ground becomes vacant to receive them. Much injury is often done to heavy land by wheeling on and digging it when saturated with wet; it will be advisable therefore, for this and other reasons, to complete all work of this kind as early in autumn as circumstances will permit. To expose as great a surface as possible to the action of the atmosphere, heavy land ought to be thrown into rough ridges: the advantage of this plan will be seen at planting-time in spring. Very light soil should be deeply dug, in preference to ridging; this also ought to be done early, that the manure may become well incorporated with the ground.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—As the heat of the bark-bed declines, gradually close the bark round the sides of the pots, till they are eventually buried up to the rims. The aim of the cultivator should be to keep the roots in an equable state of warmth and moisture, that they may not at one time be violently excited by an unnaturally high temperature, and at another paralysed by cold and wet. From the variable nature of the materials he has to work with, this object cannot be perfectly attained; but by unremitting attention a sufficient approach to it may be made to ensure success. The nights being now longer and cooler, the houses and pits should be sprinkled and closed earlier than formerly. Apply a little fire-heat to the houses when the temperature on two or three successive mornings is found below 65°. See to the re-lining of dung-heated pits before the heat of the bark-bed is too much spent.

Vinery.—Go over the late houses, and cut all the laterals close off; and if the shoots are thickly trained, a leaf here and there may be spared, taking care to retain those on the lower part of the shoots which are to be bearing wood next year. Dull and damp weather may now be expected, in which case fires should be made in the day, giving plenty of air at the same time. When the fruit is all gathered, and the wood not yet ripe, syringing, and other means for the destruction of the red-spider, must be persevered in.

Peach-house.—The principal points requiring attention now are, to keep the leaves of the trees in the late house in a healthy condition, and to remove those in the earlier houses when they are no longer useful to the wood, which, as formerly stated, will be indicated by their ready displacement. Laterals and useless after-growths may be cut off at once. If mildew appears, dust the infected parts with sulphur.

Cucumbers and Melons.—Make linings to Cucumber-beds which are wanted to continue in bearing. The principal cause of canker is too low a temperature. Late Melons should also be kept in a healthy condition, by a little artificial warmth, derived either from dung-linings or fire. It would also be advisable now to cover the lights at night.

Mushroom-house.—Continue to make up beds in succession for a winter supply. Where there is not a regular house, and it is necessary in consequence to make beds in sheds and similar places, it will be found a good plan to form a hollow space below the bed, into which heat may be thrown by means of linings. This can easily be done by making rough frame-work to support the bed.

Kidney Beans.—Where these are required very early, a first crop should now be put in. We recommended Fulmer's Early in spring, but at this season of the year some sort which occupies less space will be preferable.

Out-door Department.

The late rains have caused all kinds of weeds to grow vigorously, and it will be necessary to keep the hoe in constant employment to get them under, before wet weather sets in. Dig up the stalks of autumn Broccoli and Cauliflowers, and clear away all decaying crops. Mow Fern for garden purposes; if not cut till the fronds naturally wither, it will be more brittle.

Broccoli.—The removal of the spring sorts, which were planted thickly for that purpose, may now be proceeded with, beginning with the most forward plants. The process is so well known that it need not be here described; but it may be stated, that the stems of the plants ought to be laid nearly flat, and covered with mould up to the base of the leaves. Some persons attach importance to the direction in which the heads of the plants are made to point; practically, however, this is scarcely worth attending to. Look closely after caterpillars, which promise to be more than commonly numerous this autumn.

Cauliflowers.—Sow again on a spent hotbed, or a very warm border. When the autumn is mild, the plants sown in the end of August are apt to get too forward, and in consequence they button early in spring, instead of producing heads fit for use.

Endive.—A good method of blanching is, to invert a flower-pan over each plant, pressing its rim slightly into the ground so as effectually to exclude the light.

Lamb's Lettuce.—Sow this and other salad herbs, if not yet done.

Radishes.—It will be advisable to continue sowing a little seed at intervals of about a fortnight, which, if the weather should be open, will give a constant supply up to Christmas; or if Radishes are indispensable, a sowing might be made under glass towards the end of the month.

Orchard.—The strongest Strawberry plants intended for forcing will now require shifting into 32-sized pots; afterwards let them have room to grow, and keep them free from runners. The principal attention required now by wall-trees, is to gather the fruit as it ripens, and to preserve the remainder from wasps by all available means. As Figs from their lusciousness are great favourites with wasps and flies, some difficulty will be found in protecting them. If all other methods fail, each fruit might be enveloped in a bag of coarse muslin. Gather Filberts and other Nuts. If any new borders are intended to be made, or old ones renovated, soil for the purpose should be collected while dry.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Plants which have finished their growth require less water now. All cuttings which are rooted should be potted without delay, in order that they may establish themselves in the pots before the winter comes on. In setting the plants, give the finest specimens the best places, and try to prevent the whole from being crowded. Attend particularly to the directions given last week respecting shading, as much injury may be done by this now.

Greenhouse and Conservatory.—Attend to the directions given last week respecting the preparation and housing of the more tender species of Greenhouse plants. If any large Camellias and Orange-trees are standing out, they should be put under cover; these plants are often irreparably injured by exposure and ill-treatment in summer and autumn. Conservatory plants are probably suffering from the attacks of red-spider; it will be necessary therefore to use the engine occasionally.

Pits and Frames.—Remove Auriculas to their winter-quarters. Pot off rooted cuttings, if they are intended to be potted singly before spring. If a sufficient stock of cuttings to propagate from next spring has been put in, place them in a vacant frame or pit where they can be kept close and shaded. If there is a frame to spare, it might be planted with Neapolitan Violets, which will flower very early, if so contrived that the bed can be warmed by linings. The potting of herbaceous plants for forcing should not be delayed, because it is essential that they should be well rooted before winter.

Out-door Department.

Divide and transplant double Rockets. When transplanting Hollyhocks, and the other biennials adverted to last week, the strongest plants may be at once taken to the flower-garden, if there is room in the borders. Pinks, Carnations, Picotees, and Cloves should be planted now, if grown in beds by themselves; renewing the soil if necessary, and taking especial care that it is well drained. The cold of ordinary winters does not injure these plants; it is wet which causes their death. The soil and the atmosphere being now sufficiently moist, Dahlias will bloom finely if well protected from injurious insects, and properly pruned and tied.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Continue to plant cuttings of Evergreens, and also to put down layers. Sow stones of Apricots, Plums, and Cherries. Gather seeds of shrubs and trees as they ripen.

Forest and Coppice Woods.—See last week.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending Sept. 8, 1842, as observed at the Horticultural Garden, Chiswick.

Sept.	Barometer.		Thermometer.			Wind.	Rain.
	Max.	Min.	Max.	Min.	Mean.		
Friday 2	30.175	30.075	81	58	69.5	W.	—
Saturday 3	30.203	30.153	74	53	63.5	W.	
Sunday 4	30.197	30.193	74	49	61.5	N.W.	.01
Monday 5	30.196	30.036	74	47	60.5	S.	—
Tuesday 6	30.025	29.942	73	46	59.5	W.

Sat. 17	67.6	47.4	57.5	6	0.90	1	1	2	1	2	3	4	2

The highest temperature during the above period occurred on the 12th, in 1841—thermometer 84°; and the lowest on the 17th, in 1840—thermometer 29°.

REPORT ON COVENT GARDEN MARKET,

For the week ending Sept. 9, 1842.

As usual, the supplies both of fruit and vegetables have been very large, and considerably greater than the demand; trade is consequently dull. *Fruit:* Pines are plentiful, from 3*s.* to 6*s.* per lb. There is no difference this week in the price of Grapes and

Melons, except that Muscats are a trifle dearer. Peaches and Nectarines are not so abundant, and fetch from 1*s*. to 4*s*. per doz. Green-gages are the only kind of Plum fit for dessert, and are selling from 4*s*. 6*d*. to 5*s*. per half sieve; Muscle and other large culinary Plums, from 3*s*. to 3*s*. 6*d*.; and Damsons, of which there is an excessive supply, from 2*s*. 6*d*. to 3*s*. per half sieve. Figs are a little cheaper, and fetch from 1*s*. to 2*s*. 6*d*. per doz. There is scarcely any alteration in the prices of either Apples or Pears; a few Gansell's Bergamots have made their appearance, from 6*s*. to 12*s*. per half sieve. Siberian Crabs are abundant from 2*s*. to 2*s*. 6*d*. per half sieve. Walnuts, chiefly imported from France and Holland, fetch from 6*s*. to 7*s*. per peck. Seeds of the Nastúrtium for pickling are selling at 2*s*. per half sieve. *Vegetables*: Cauliflowers have improved much of late, and fetch from 5*s*. to 6*s*. per doz. Brocco1i is tolerably abundant, from 9*d*. to 1*s*. per bunch. Cabbages and Coleworts fetch the same price as in last week's report. French Beans and Scarlet Runners are somewhat dearer; the former selling from 2*s*. 6*d*. to 3*s*. 6*d*., the latter from 1*s*. 6*d*. to 1*s*. 9*d*. per half sieve. A few Artichokes may still be met with from 3*s*. to 4*s*. per dozen. Onions are rather advanced in price. Tomatoes also are dearer, and fetch from 2*s*. 6*d*. to 3*s*. per half sieve. Capsicums are abundant, the ripe fruit selling from 3*s*. 6*d*. to 4*s*. per 100; the green fruit, from 1*s*. to 1*s*. 3*d*. Field Mushrooms are very plentiful, and fetch from 3*s*. to 4*s*. per bushel; the smaller ones for preserving, from 4*s*. to 5*s*. per bushel; those of in-door growth are selling from 1*s*. to 1*s*. 3*d*. per pottle.—*Flowers*. We observed amongst the cut flowers, Magnólia grandiflora, Nérium splendens, Jasminum revolutum, Róchea falcata, Bouvárdia splendens, with many Amaryllises and Dahlias.

PRICES, SATURDAY, SEPT. 10, 1842.—FRUITS:—

Pine Apple, per lb. 3*s* to 6*s*
Grapes, per pound, 1*s* to 3*s*
— Muscats, per pound, 2*s* to 5*s*
— Portugal 1*s* to 1*s* 6*d*
Melons, English, each, 1*s* to 3*s*
— Dutch, 6*d* to 1*s* 6*d*
Peaches, per doz. 1*s* to 4*s*
Nectarines, per doz., 1*s* to 4*s*
Figs, per doz., 1*s* to 2*s* 6*d*
Plums, per hf. sieve, 3*s* to 3*s* 6*d*
Damsons, per hf. sieve, 2*s* 6*d* to 3*s*
Greengages, per hf.-sv., 3*s* 6*d* to 8*s*
Apples, dessert, per bush., 3*s* to 6*s*
— [illegible], 2*s* to 4*s* 6*d*

Pears, dessert, per hf.-sieve, 2*s* to 6*s*
Mulberries, per gallon, 9*d* to 1*s*
Cucumbers, per doz., 1*s* to 4*s*
Oranges, per doz., 1*s* to 3*s*
— per 100, 6*s* to 16*s*
Lemons, per doz. 1*s* 3*d* to 3*s*
— per 100, 9*s* to 20*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 3*s*
Filberts, English, per 100 lbs. 50*s* to 75*s*
Walnuts, per bushel, 16*s* to 24*s*
Nuts, per bushel—
— Brazil, 20*s*
— Barcelona, 24*s*

VEGETABLES.

Cabbage, per doz. 9*d* to 1*s* 3*d*
— plants, per doz. 2*s* to 2*s* 6*d*
— Red, for pickling, 2*s* to 4*s*
Broccoli, per bunch, 6*d* to 1*s* 6*d*
Cauliflowers, per doz., 5*s* to 6*s*
Beans, Kidney, per hf. sv., 2*s* 6*d* to 3*s* 6*d*
— Scarlet, per hf.-sv. 1*s* 3*d* to 1*s* 6*d*
Potatoes, per ton, 50*s* to 80*s*
— per cwt. 2*s* 6*d* to 4*s*
— per bushel, 1*s* 6*d* to 2*s* 6*d*
— Kidney, per bu., 2*s* to 2*s* 6*d*
Artichokes, per doz., 3*s* to 4*s*
Turnips, per doz. bun., 2*s* to 2*s* 6*d*
Carrots, per doz. bun., 3*s* to 5*s*
Red Beet, per dozen, 6*d* to 1*s*
Parsneps, per doz., 1*s*
Horse Radish, per bundle, 1*s* 6*d* to 5*s*
Radish, per doz. hands (24 to 30 each) 9*d* to 1*s*
— Turnip, p. doz. bch., 9*d* to 1*s*
Spinach, per sieve, 1*s* 6*d* to 2*s*
Leeks, per doz. bun., 3*s* to 4*s*

Onions, per doz. bch., 2*s* to 5*s*
— Green, p. doz. bun. 2*s* to 4*s*
— Spanish, per doz. 1*s* to 3*s*
— for Pickling, per hf.-sv. 2*s* to 3*s*
Garlic, per lb. 4*d* to 8*d*
Shallots, per lb., 8*d* to 1*s*
Lettuce, Cabbage, p. sc., 9*d* to 1*s*
— Cos, 1*s* to 1*s* 3*d*
Endive, per score, 1*s* 3*d* to 1*s* 6*d*
Celery, per bd., (12 to 15), 6*d* to 2*s*
Small Salads, per punnet, 2*d* to 3*d*
Watercress, per doz. sm. bun. 4*d* to 6*d*
Parsley, per doz. bun., 1*s* to 2*s*
Tarragon, per doz. bun., 2*s*
Mint, per doz. bunches, 2*s*
Basil, per doz. bunches, 2*s* to 4*s*
Vegetable Marrow, per doz., 6*d* to 8*d*
Tomatoes, per hf. sv. 1*s* 6*d* to 3*s*
Capsicums, green, per 100, 1*s* to 1*s* 3*d*
— Ripe, 2*s* to 5*s*
Mushrooms, per pottle, 9*d* to 1*s* 3*d*
— Field, per bus., 3*s* to 4*s*

Notices to Correspondents.

W. W.—We would certainly recommend you to plant your Fig-trees in the border of a house or pit, in preference to keeping them in pots; because, in the latter case, the roots are apt to become matted, and when in that state the least neglect in supplying them with water is sure to make them drop their fruit. The soil in which your trees grow is not too rich for them. You might try the effect of ringing the branches, which has been successfully practised in many cases. It is simply to remove a circular strip of bark, about half an inch in width, just beneath the lowest fruit upon each shoot, which, preventing the sap from descending, throws more vigour into the fruit above, and causes it to swell. This last remark applies equally to "*One anxious to Learn*," except that as his trees grow against a wall in the open air, we would advise him to remove all the fruit which has formed upon the shoots if it is not likely to come to perfection this season. He should continue to remove all autumnal-formed fruit, leaving only such as are no larger than ordinary leaf-buds; otherwise they exhaust the trees to no purpose. If he protects them, there is nothing better suited than branches of the Spruce Fir, which should be fixed with their tops downwards, so as to throw off the rain and snow. In mild winters the young wood is rarely injured; but as it is seldom sufficiently matured in this country, the safest way is to protect it.—‡

W. W. J.—You should not expect your Roses to do much good, if you force them directly after they are potted. The best time for that operation is in the early part of October, and the plants should be allowed to make one summer's growth previously to being forced. Your Pine-sucker does not appear to belong to a distinct variety, but to a seedling from the Island of Trinidad; many of which were, a few years since, brought into this country. If it really is one of this description, its fruit is of a good size, with tolerable flavour; but, from its wide-spreading habit, not worthy of cultivation.—‡

R. G.—When you remove your young Pear-tree which is growing so luxuriantly, we would advise you to shorten a few of the strongest roots; this, in addition to the check which it will receive in transplanting, will be sufficient to restrain its over-luxuriance. You had better remove it this autumn, and if, in the space of a year or two, it becomes too vigorous, root-pruning may be again resorted to.—‡

Andante.—You cannot have a Vine better adapted for growing in a greenhouse than the White Sweetwater. Before planting it, you should prepare a border for it, by removing the soil to the depth of two feet for some distance in front of your greenhouse, and by making the bottom to slope *from* the wall. First put in a layer of rough stones or brickbats, then another layer of lime rubbish; and afterwards fill up with good rich compost. The border will be improved by raising it a little above the level of the surrounding surface.—‡

G. G. W.—We cannot say much in favour of your Seedling Fuchsias. They are neither of sufficient brilliancy nor size to render them desirable varieties.—‡

F. I. C.—Your plants are, Epidendrum virescens and Mutísia ilicifólia.—†

J. D.—Your plant is Tropæ'olum peregrinum. The best Californian annuals are, Collínsia bícolor, C. grandiflora, Clárkia pulchella, C. élegans, Eutoca víscida, Godétia rubicunda, G. lépida, Gilia trícolor, Lasthénia californica, Leptosiphon densiflorus, L. androsaceus, Limnanthes Douglasii, Lupinus nanus, Nemóphila insignis, N. atomária, Œnothera bifrons, Œ. Lindleyana, and Platystemon califórnicum. You will find a description of an economical Pit for wintering plants at p. 659 of last year's *Chronicle*. The latter part of November is the best season for transplanting the Robinia Pseud-Acacia. It is not advisable to remove this plant after it has reached the height of 7 or 8 feet.—‡

H. Y. J.—Your plants are—1, Campánula rotundifólia; 2, Myosotis arvensis; 3, Silene noctiflora; 4, Apárgia autumnalis; 5, Bártsia odontites; 6, Galeopsis tetrahit.—‡

Eleanor's plant is the Spiranthes autumnalis, or the Lady's Traces.—†

R. G.—We know of no method to prevent the Harvest-bug from attacking the legs when we walk amongst grass or stubble in the summer; but one of the best means of obtaining relief from the irritation is, we believe, to apply liquid ammonia to the parts affected, by dabbing it on for two or three minutes. Stone Mercury and Corrosive Sublimate are the same thing.—*R.* ‡

E. J. Gill.—The leaves of Elms vary so much in their size upon different shoots, and especially upon young trees, that it is impossible to form any opinion of your plant by the mere sight of its foliage. That it is a variety of Ulmus montana, there is no doubt; but the leaves are scarcely distinct from those of U. montana major, U. mont. rubra, and U. mont. vegeta, when taken from young plants. It is very likely to be a seedling from U. montana rubra, or the Weeping Elm, which seeds freely.—¶

W. M.—We beg pardon for the error, into which we were led by the plant being called a climber. It is apparently the Maclura aurantiáca, or Osage Orange.—†

B.—We fear your Walnut-tree, which is old and dying from its head, is incurable. Probably its roots have reached an unfavourable subsoil. The only chance of saving it would be to undermine it if possible, and cut through the perpendicular roots, preserving the others. A plague of fleas is indeed a serious nuisance; we pity your hard case, without much hope of assisting you. "Ruricola's" answer is this:—"As floors that are sanded and sprinkled with sawdust are the most likely to harbour fleas, so boarded floors, that can be frequently washed with hot water and soft soap, or hot soap ley, will be most free from them; as their maggots, which live and undergo their metamorphoses in the crevices, are thus destroyed. It is said that sprinkling the floors with a decoction of Wormwood will free a house from these vermin; and fleas have likewise a great antipathy to Scotch snuff; but when dogs and cats are the inmates of a house, I believe it is impossible to be free from fleas in the summer." A case like your own, but where bugs, not fleas, were the performers, was completely cured thus:—The walls were stripped of paper, and the paper was *burnt*. Then all the crevices in the mortar and plaister were *very carefully* stopped with plaister of Paris. Finally, the joints of the floor, and of all parts of the woodwork, were painted with a mixture of soft soap and corrosive sublimate. Every bug was thus destroyed, and not one has since appeared.—†

Query.—You cannot do better than manure your trees, if they are ornamental and out of health, and are not Fir-trees. In the autumn break up the ground round their roots, beginning almost as far from the trunk as the branches spread. It is of no use breaking it up close to the trunk. Leave it rough all winter. Then in the spring, about the end of February, fork in some good rotten manure, or a good compost heap. This, however, is of little use unless the ground is *well* drained. You may cut down Laurustinus in the month of April. It is not safe to begin to transplant before the middle of November, unless the leaves should be quite off the trees earlier.—†

L. M. N. should proceed with his Cedars of Lebanon as directed in the case of *Query*, only he must apply the nitrate of soda instead of dung, dissolved in water, at the rate of half a pound to a square rod. It is, however, of the utmost consequence that the nitrate should be unadulterated. See one of our leading articles of to-day.—†

F. H. S.—Honest men can hardly contend with those who are unscrupulous. The officers of the Horticultural Society cannot enter into a discussion with anonymous correspondents who choose to send falsehoods to the newspapers. The writer who says that the plants in the great conservatory at the Society's garden are drawn, must either be so ignorant as not to know the difference between growing fast and being drawn, or so malicious as to be beneath notice. We might content ourselves with asking you to go to the garden, and inspect the house; but for your satisfaction, we will add that the statement is perfectly untrue.—†

Gatton Park.—The Cactus tetragonus rarely flowers. It has, however, produced its blossoms this year in the garden of the Horticultural Society. The Passiflora is quadrangularis.—†

A Beginner.—You are misinformed as to Cratægus viridis being handsome. It is a small bush, with white flowers growing in threes, and green downy fruit. It is also called C. virgínica and C. spathulata. A figure of it under the latter name is to be found in the Botanical Register, vol. 22, plate 1890.—†

Smelfungus.—We really do not know how to advise as to the destruction of the fungi that spring up on the turf, without injuring it. Suppose you try a clear solution of corrosive sublimate. It will apparently kill your grass, but it is asserted that the turf will spring again greener than ever. Try a small portion first.—†

Jane may easily strike cuttings of Alo'ysia citriodora, if she possesses a frame, or anything in which she can command a slight bottom heat, by taking off the ends of this year's shoots, about three inches in length, and preparing them in the usual manner. Plant them in a well-drained pot, of the size required, in a mixture of silver sand and fine vegetable mould; water them well, to settle the soil around the stems, and, after allowing them to stand in the shade for about an hour, for the superfluous water to drain from them, remove them to the frame, and cover them with a bell glass. In about three weeks they will begin to grow.—‡

Bητα.—The best manure for Potatoes when stable-dung cannot be had, is a mixture of eight bushels of salt and thirty bushels of wood-ashes per acre. Salt alone is valuable if the land is in good heart. The Dunmore Pear is to be procured at the Nurseries.—† ‡

H. O.—Many thanks. They will prove very acceptable.—‡

Albert.—The annual payment required to become a member of the Horticultural Society is four guineas, payable in May for the year *preceding*; the admission fee is six guineas; and the composition for life, 48*l*. 6*s*. The terms of admission to the Zoological Society are the entrance fee, 5*l*.; the annual contribution, 3*l*.; or the composition money, 35*l*.—‡

A. G.—No. 1 is a species of Pánicum, but not British; 2 is Thríncia hirta. The other is not a Fungus, but a species of Tremella; in its present state it is impossible to say which.—†

B. B.—The most suitable soil for Abies Deodara and Araucária imbricata is a light sandy loam. There is no kind of manure which you can mix with it that will improve their growth, if they like the soil.—‡

E—e, Herts.—We have not had any experience in ascertaining whether Rosa Devoniensis is hardy or not; but we believe it is generally considered so.—‡

C. E. F.—There can be no doubt that there is something peculiar in the soil, which causes the flowers of the Hydrangea to come out blue instead of Rose, their natural colour. There are various suppositions as to what that something really is; and we have strong reasons for supposing that alum is at least one of the things which will produce that effect. Some experiments connected with this subject are at present in progress in the Garden of the Horticultural Society, and thus far they warrant the correctness of the opinion. By-and-by we shall be better able to confirm it, and to give you directions as to the proportion in which alum ought to be applied.—§

Phyllanthus.—In general Datura arbórea looks unhealthy during the winter, as it then loses all its leaves. Perhaps your plant began to grow early, and is now going to a state of rest. Keep it rather dry throughout the winter, in some place out of the way, such as a pit, from which the frost is excluded. In the spring re-pot it, and place it in a good situation in the greenhouse, where it will soon grow vigorously. A rich, free soil should be used in potting, such as a mixture of loam and leaf-mould in equal proportions, and about one-fourth of rotten dung and sand. It is very ornamental when planted out in the flower-garden during the summer months, and can be easily taken up, preserved through the winter, and turned out again.—§

A. P.—Your plants are—1, Lantana aculeata; 2, Begónia sanguinea; and 4, Justícia bicolor. The rest are such fragments, that we cannot name them.—‡

An Original Subscriber.—We cannot discern anything like an insect upon the leaf of your Pelargónium. There are some black spots upon it, which appear to be the excretions of the scale, or some other insect. If you have any Vines growing above your plants, you may rely upon it, this is the case. The *Vines* should therefore be looked carefully over after they have been pruned, and all the rough bark should be removed. Scrape every shoot upon which any scale is visible with the back of a knife, and daub them over with a mixture of soft soap, tobacco-water, and sulphur, of the consistence of paint.—‡

The large Fungus sent from the Royal Gardens, Buckingham Palace, is the Bovista giganteum, and is the kind used, when dry, for smoking bees.—†

Θ.—Your plants are Stapélia bufónia, Aster miser, and Begónia nítida.—†

West Riding.—The Double ear of Wheat is of unusual occurrence. You will, however, find that in Egyptian Wheat the straw always bears many ears at the end, some of which are smaller than the middle one.—†

Mr. Kingdon's Pimpernel, in a monstrous state, is indeed a curiosity. We have had drawings made of it for publication.—†

Newark.—We shall soon return to Mr. Wests's work on Foresting, which we recommend you to read carefully; for, if we mistake not, some of the woods in your neighbourhood would be all the better for a judicious examination.—†

Northampton's flower is Zygopétalum rostratum.—‡

J. T. shall be answered next week.—‡

C. R. B.—Many thanks for your specimens of the Hop.—‡

G. H.—Mr. Henderson, Pine Apple Place, Paddington.—‡

C. F. W.—The new Irises mentioned at p. 590, as cultivated at Paris, will no doubt be procurable in a short time of some of the English Nurserymen.—‡

G. Croft.—The colour of your lightest scarlet Verbena is very bright, but the trusses of bloom are small. The other is not different from many more in cultivation.—‡

D. E.—There are several Dahlias in cultivation of the same colour as your Seedling, and far superior to it. Your blooms are small, the petals are thin and much creased; the centre is defective from the petal not unfolding sufficiently.—*

Paris.—The Achimenes grandiflora of Gand is perfectly distinct from A. longiflora.—†

W.—Asparagus beds must not be formed entirely of sea-sand; but a large portion may be mixed with the other soil to advantage. The quantity used must, however, depend upon the stiffness of the land to which it is applied.—‡

Salopian.—Your plant is some kind of Rhus, but we cannot tell which in its present state. He'speris speciosa is hardy; we are not acquainted with the treatment necessary to make it flower. No doubt the part which you supposed to be a root, because it had found its way through the bottom of the pot, and which had formed shoots, was a creeping underground stem.—‡

T. S. P.—Your plant is Epilóbium Dodonæi.—†

A Subscriber.—We believe that the cause of Pine Apples being sometimes watery and deficient in flavour, is attributable to their having received too great a supply of water when approaching to maturity. This, in conjunction with excess of moisture in the atmosphere, would no doubt produce that want of substance which you complain of. After the fruit begins to change colour, water may be entirely withheld.—‡

G. H. P.—Many thanks. They will be very useful.—‡

A Correspondent, whose letter we have mislaid, has inquired as to the best means of preserving fruit in water only, without sugar. We have no personal acquaintance with the practice, but possibly some of our correspondents have, in which case we should be much obliged for some information about it. Fruit, properly prepared, is said to bear a voyage to the West Indies, and to keep months without changing. We presume this is effected by exhausting of air the cases containing the fruit. In the absence of better information, we may mention, that some of the fair wives of Norfolk preserve Bullace, not over ripe, in glass bottles, by pouring boiling water over them, and corking and sealing them down immediately. The bottles will not crack, if they are heated before the water is introduced. This plan answers very well; but they prefer putting up their fruit with 4 oz. of sugar to a pound of fruit, and setting it in a cooled brick oven, after the bread is withdrawn, till the skins begin to burst and the sugar dissolves. In that case the bottles are corked down before they are placed in the oven.—†

G. H. P.—Many thanks. They will be very useful.—‡

Mr. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3*d*. each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5*s*. for every 25 copies required.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

As we anticipated in our last, the details of the India news received in the course of Saturday do not bear the unfavourable character given to them by the French telegraph. The troops do not appear to have suffered from the extreme heat and from sickness to the extent which was at first reported, and we do not find those serious evidences of mutiny and discontent which the telegraph had led us to expect. There is no doubt, however, that the movements of the troops are regarded in all parts of India with general anxiety, and that the utmost uncertainty prevails as to Lord Ellenborough's intentions. It seems to be established that orders for a withdrawal were actually issued, but recalled on the remonstrance of General Pollock; and that no arrangement had then been made for the release of the prisoners. The future proceedings of the Governor-General are the subject of much contradiction; while one party affirms that the troops are to retire in October, another asserts that the army of reserve now forming on the frontier is intended to co-operate in an extensive plan for a simultaneous movement on Cabul from various parts of the country. It would be useless to attempt to reconcile these statements; but it may be mentioned that all classes in India concur in declaring that a retirement in the present state of affairs would be in the eyes of all Asia the deepest humiliation the British Government of India has ever suffered. From China we learn the particulars of another engagement, in which, as usual, an immense number of Chinese were slain, while the casualties of our own troops were comparatively trifling. Lord Saltoun had passed Singapore with his expedition, and Sir H. Pottinger was awaiting his arrival, preparatory to a movement towards Pekin. The report in the Canton papers that the Emperor had retired into Tartary was generally considered to be true.—Our French news has little political interest; the conclusion of the treaty between Belgium and the German Union admitting the silks and wines of Germany at the same duty as those of France has given rise to some discussion; and the Indian news still engages the attention of the journals.—From Spain and Portugal we have no intelligence of particular interest: the approaching prorogation of the Chambers, and the details of the financial budget, showing an actual deficit for the year, are the chief topics of conversation in Lisbon.—From Germany we learn that the King of Prussia has issued an ordonnance appointing a commission of the provincial diets to be consulted on all matters relating to the interests of the States. A report was circulated in the middle of the week announcing the death of the King of Hanover, at Dusseldorf; but it was soon ascertained to be without foundation.—In the Levant no important change has occurred since our last; the affairs of Persia and Turkey are advancing towards a settlement, and there is no longer any fear of a collision.

At home, the Queen's progress in Scotland is the leading subject of interest. Her Majesty and the Prince have left Dalkeith on a tour in the Highlands; and all parts of their progress have been marked by a constant demonstration of loyalty and attachment. The manufacturing districts are still unsettled; the men return slowly to the mills; and although there is no longer any apprehension of a general movement, there appears in many towns a want of understanding between the masters and the men which promises to prevent, for some time longer, the complete restoration of tranquillity.

Home News.

Court.—Her Majesty and Prince Albert have left Dalkeith Palace for a tour in the Highlands. They passed through Perth on Tuesday, on their way to Scone. Both the Queen and Prince are quite well, and are received by all classes with the greatest loyalty and respect. The Prince of Wales and Princess Royal are at Windsor Castle, and are in excellent health.

The Archbishop of Canterbury.—We are happy to announce that the health of his Grace the Primate has been gradually improving during the week, and that the steady and gradual progress of the improvement seems to afford good grounds for the expectation that it will be permanent. The last bulletin was issued on Wednesday morning, announcing that his Grace's recovery of health and strength is so steadily advancing, that no further bulletins are considered necessary.

Gazette Announcement.—The Queen has been pleased to direct letters patent to be passed under the Great Seal, granting the dignity of a Viscount of the United Kingdom to General Lord Hill, G.C.B., and his heirs male, by the name, style, and title of Viscount Hill, of Hawkstone, and of Hardwicke, in the county of Salop; and, in default of such issue male, the said dignity of Viscount to Sir Rowland Hill, Bart., nephew of Lord Hill, and his lawful heirs male.

Bank Returns.—The returns of the weekly average circulation of the kingdom, ending the 20th ult., shows an increase of 160,702*l.*, as compared with that of the previous month. The Bank of England has expanded its issues by 443,000*l.*, the difference between 20,351,000*l.* and 19,908,000*l.* The private banks are less by 15,953*l.*, the difference between 5,150,628*l.* and 5,166,581*l.*; the joint-stock banks by 113,105*l.*, the difference between 2,823,090*l.* and 2,939,195*l.* The decrease in the circulation of Scotland is 40,845*l.*, the difference between 2,674,835*l.* and 2,715,680*l.* The total contraction in Ireland is 109,395*l.*, of which the Bank of Ireland is less by 61,825*l.*, the difference between 2,831,750*l.* and 2,892,775*l.*; and the private and joint-stock banks of that part of the kingdom are less by 48,370*l.*, the difference between 1,632,617*l.* and 1,680,987*l.* The stock of bullion in the Bank of England has increased from 8,883,000*l.* to 9,570,000*l.*, or very nearly double what it was at this period of last year.

Foreign.

France.—There is little political interest in the news from Paris. The journals have, indeed, little subject for controversy. Some express great wrath at Belgium for allowing German silks and wines to enter at the same duty as French. Others are very busy endeavouring to decide whether St. John of Nicaragua be on the Atlantic or the Pacific—a question which occupies columns even in the gravest prints. The non-publication of the telegraphic despatch from Marseilles, with the heads of the India news, in the Paris papers, had caused considerable surprise; it was certain that intelligence of an unfavourable character was in Paris on Tuesday night of last week; and it is no less clear that some persons were in the secret, and speculated for the fall on Wednesday's Bourse. The "Messager" and "Moniteur" confined themselves to the simple notification that the mail had arrived at Marseilles, and that the details had been expressed. Since the French Post-office has closed the Marseilles road to expresses (for although constantly beat, it persists in arresting couriers, setting the judgments of the Courts at defiance), there has been one continued system of manœuvring in the *exploitation*, or turning to account, of the India and Chinese news. The safeguard of the public—early publicity—having been taken away, the field has been left open to the speculative individuals who have managed to secure the monopoly of the earliest advices.—The Portendic question is exciting some attention. The efforts of the French at Portendic and in Senegal have been to exclude the English from the gum trade, to which they have a right by treaty. They have succeeded in their object; but the consequence is, that certain French speculators are determined to make the monopoly closer. The result of this system appears in recent letters from Senegal, which state that the Moors, holders of the gum, pressed by the Senegalese Society, have come to the determination not to deliver any more gum. They have taken just the number of guineas necessary for their wants. The trade, which in ordinary years produced four millions of kilograms of gum, will give scarcely a million this year. The Association has not bought more than one quarter its usual quantity. Everything has gone wrong, merchandise is dear and scarce, and traders disgusted. Seven-eighths of the affairs of Senegal are connected with the gum trade, and all at a stand, owing to the monopoly.—The Court of Cassation annulled, on the 3d instant, the decision of the Royal Court of Paris, which condemned the editors of the "Temps" to 20,000 francs fine, for an informality in the publication of that journal. The affair is, therefore, to come again before the Court of Amiens.—According to the "Quotidienne," the amount voted by the Chamber of Deputies for the fortifications of Paris will fall very short of the expenditure. Of the one hundred and forty millions voted, 75, it says, have already been expended, and 25 are due to contractors, so that 40 millions only remain. The "Quotidienne," in order to show that these 40 millions will not go very far, observes, that ten forts are not half finished; that four forts are not a quarter finished; and that six are not begun.

The Royal Family.—A letter from Tréport, August 31, says that the town was honoured on the previous day by the presence of the Queen, Madame Adelaide, the Duchesse de Nemours, and the Princess Clementine. They were present at a charity sermon preached by the Abbé Coquereau. The collection amounted to 1,000f.—We learn from Aire, in the Pas-de-Calais, that the Duke de Nemours had arrived there on the 29th, during a violent storm. The authorities went to meet him, accompanied by a great part of the population and the National Guard, and all got completely wet through. The Prince alighted from his carriage before his entrance into the town, and, having passed through the Rue d'Arras on foot, reviewed the National Guards and the troops of the line. The mayor presented a loyal address to his Royal Highness, to which the Prince replied most graciously. Notwithstanding the wetness of the weather, a vast number of persons remained in the open air during the inspection of the troops, and loudly cheered the Prince. The Duke returned from thence to Paris, but left almost immediately for Compiègne, where he inspected the troops. When alluding to the Duke of Orleans, whilst the Duke of Nemours was at St. Omer, he spoke with great emotion, saying that his memory could never be sufficiently regretted or honoured, and that it should be his constant endeavour to fulfil his duties with zeal, in order to acquire the esteem and affection with which his brother was surrounded.—The Duchess of Orleans, who had been indisposed for some days past, is, we are happy to learn, at present in the enjoyment of much better health. The health of the Comte de Paris is excellent. Apartments are at present being prepared in the Pavillon de Flore, at the Tuileries, for the Duchess and the young Princes. Her Royal Highness will not inhabit the Pavillon Marsan, where sad recollections would unceasingly increase her affliction. It is however stated from another source that the apartments in the Pavillon de Flore are being fitted up for the reception of the Duke and Duchess de Nemours. It is said that the Duchess of Orleans has expressed an objection to reside in the Tuileries.

The Provinces.—The Minister of Public Works, accompanied by the directors, engineers, and contractors of the Paris and Rouen railroad, went on Wednesday to inspect the works along the line from Paris to Vernon. After examining the bridges at Bessons, Maisons, and over the valley of Vaucouleurs, the Minister paid particular attention to the tunnel of Rolleboise, which runs 2,700 metres in length, and examined it throughout, expressing at the conclusion his perfect satisfaction at the manner in which the whole of the works had been executed.—The privilege for the railroad from Paris to Lille has just been conceded to a company, represented by MM. Mellet and Henri, engineers, and composed in a great measure of English shareholders. The treaty is said to have been signed on Saturday by the Minister of Public Works.—The Paris Papers state that the Seine, near the town of Quillebeuf, presents at this moment a most animated appearance. At 120 metres from the quay an immense scaffolding, supported by a bridge, rises from the centre of the river, and marks the spot where the Télémaque rests for a few days longer buried beneath the waves. This bridge, forming actually a portion of the wreck, serves as a platform for a numerous crew, who are incessantly occupied in passing round the hull the chains destined to raise it. The works, they state, have hitherto been carried on with remarkable activity and success; and they express a hope, that in three weeks, at the latest, the solution of a problem at once historical, financial, and mechanical, will be definitively known.—The Rouen papers state that a band of wolves have taken up their haunt in the forest of Mauny, and have lately committed serious ravages in the communes of Yville, Anneville, and Berville. A few days back, a forest-keeper was taking his rounds, when a wolf rushed out of a thicket, and carried off his dog before his eyes. A day or two afterwards a shepherd was driving his sheep home to Yville, when a wolf fell on a sudden on the flock, and seized one of them. The man immediately ran after the animal, and, soon overtaking it, the weight of its prey not allowing it to run very fast, caught hold of the sheep. A struggle ensued, which ended in the wolf's being frightened by the man's shouts, and let go its prey. On Thursday night the flock of a farmer at Anneville was attacked, and 9 sheep were killed, and 18 badly wounded.

Spain.—Our accounts from Madrid are of the 29th ult. Señor Arguelles, the guardian of the Queen, was said to be dangerously ill. The Opposition members of the Cortes continued to hold meetings in the saloon of one of their leading members. Some of the papers state that the Government was organising a secret police, and that several domiciliary visits had taken place.—The Barcelona news contains some details of the arrest and detention of Prince Lichnowski, an Austrian subject, announced in our paper of last week. The Prince seems to have visited Spain with a regular passport obtained from the Spanish Minister at Lisbon, at the request of Lord Howard De Walden, and he landed at Barcelona under the express authority of the Political Chief and Captain-General of Catalonia. His arrest took place, because he had been formerly in the service of Don Carlos.—The journals continue to be filled with accounts of the ravages occasioned by inundations in Catalonia. It appears that rain fell in torrents during several days, but particularlarly on the 24th, when the Llobregat and Noya overflowed their banks, and soon formed but one immense sheet of water. Several districts were entirely laid waste; many of the inhabitants, surprised by the floods, were drowned, and the damages caused were calculated to amount to 4,000,000 piastres. The waters of the Llobregat had not risen to so great a height since the year 1740. These papers contain no political intelligence. They mention, however, that the troops under General Zurbano had so actively chased the smugglers along the frontier, that contraband had almost ceased, and the receipts of the Customs had increased during the last two weeks 25 per cent.—The papers allude with great regret to the loss painting has just experienced by the burning of the Convent of Villada, in the kingdom of Leon. It contained immense treasures in paintings of Velasquez, Murillo, Ribera, and other first-rate painters of the Spanish school, besides many of the Dutch masters, of surpassing value.

Portugal.—We have Lisbon news to the 29th ult. The Chamber of Deputies was still occupied with the discussion on the vote of financial credit to the Government. The Finance Minister had presented his budget for the year, on which there appeared an actual deficit of 270 contos. The debate was expected to terminate in a day or two, with a large majority for Ministers. Nothing of particular interest had occurred in the Chamber of Peers. The Chambers would be prorogued in about ten days until the ordinary session, commencing on the 2d of January. The re-construction of the Ministry would be completed about the period of the prorogation; and the position of the Government was stronger than it had been for many weeks back. No progress whatever had been made in the tariff convention, and the Portuguese had secured an advantage by the conclusion of the commercial treaty, and the extinction of all the privileges of British residents, without any specific equivalent of reduced duties in return, which they were determined not to forego. No considerable reduction would be made in the import duties upon British manufactured produce. The Bank had advanced money for the payment of the claims of the British Government in September and October. The Archduke Frederick of Austria still remained at Lisbon.—The affair of the slaver Gloria, which entered under the Portuguese flag, and had, since it was injudiciously given up by the Portuguese Government, got Spanish papers and hoisted the Spanish flag, seemed likely to be a serious cause of quarrel between Spain and Portugal. The proofs the Portuguese Government have obtained of the illegal character and designs of this vessel, and the defective grounds on which she was given up, have led them to issue a "Portaria," declaratory of their intention of resuming possession; but the owner threatened resistance, had hoisted his flag, and the Spanish Minister menaced war if violence were used or the flag insulted.

Belgium.—The ordonnance of the 28th of August, which permits the import into Belgium of German wines and silks, on the same footing as that of France, established by the late commercial treaty between the latter country and Belgium, has naturally excited the anger of the French; and we find, in consequence, all the Paris papers loud in their denunciations of Belgian ingratitude. The "National" contends that if "the cause of this conduct is sought for, it will be found in the fact that Belgium owes everything to France; that she has obtained from her everything she required; and that Germany, on the contrary, has always treated this little people as an upstart. Belgium, as it appears, is anxious to show that she possesses the two principal virtues of the *parvenu*—a profound contempt for those who testify towards her some consideration, and a profound respect for those who despise her." M. Lebeau, the ex-Minister, during the debate in the Chambers, said that he had always been an advocate for uniting with Germany by all means consistent with the interests of Belgium; but at the same time protested against placing the wines and silks of Germany on an equal footing with France without obtaining any equivalent. He argued that England might demand a similar concession: to which the Minister of the Interior replied that if England would change her tariff, he desired nothing better than to carry into effect that which he had long wished to do for England. Some discussion had arisen on the question whether the Government had money for the third voyage of the *British Queen*, after the losses occasioned by her two last voyages; but Ministers protested against interference in a matter purely administrative, and the affair dropped.

Holland.—Letters from the Hague inform us that M. Thiers arrived there on the 30th ult. from Antwerp, and passed the day in visiting the gallery of pictures and the Japanese collection. On the 31st he set out for Amsterdam. The object of his journey is to view, for the second time, the collection of paintings, and to obtain a more perfect acquaintance with the Dutch system of embanking and draining.

GERMANY.—It was announced in the "Standard" of Wednesday that intelligence had been received of the death of the King of Hanover, after taking an ice while heated, at the review of Dusseldorf, on Saturday. The information was said to be derived from a gentleman who had arrived direct from Dusseldorf; no such tidings have been received at His Majesty's apartments in St. James's Palace, but there is reason to believe that he is seriously indisposed. The Hamburgh papers state that the marriage of the Crown Prince of Hanover and Princess Mary of Altenburg will take place in February next year.—The "Prussian State Gazette" of the 31st publishes a Royal Ordonnance, appointing a commission of the different provincial diets to report to the King on the various changes and ameliorations of which the states are susceptible; it being, however, laid down as a principle that the appointment of the commission is not to interfere with the fundamental constitution of the states. It is understood that the King intends to consult this commission before he decides on the following important measures:—1. The arrangements for the diminution of taxes, promised for the 1st of January, 1843. 2. The establishment of a general railroad communication between the states at the Government expense. 3. A Bill respecting river navigation where private rights of property are concerned. The "Suabian Mercury" says that the Cartel Convention has not been renewed between Russia and Prussia, but merely a provisional arrangement until fuller negotiations are entered into and completed. The King is now making a tour through his Catholic provinces, and has been very well received at their chief town, Munster. He is on his way to Cologne, where several German potentates are assembled to receive him. The King will there perform a great Teutonic solemnity, that of laying the first stone of the re-edification of the magnificent cathedral. Last week a curious spectacle took place at Berlin, of which there is scarcely an example in modern times, at least in Germany—a swimming masquerade. This spectacle was given by the pupils of the Royal Swimming School of Berlin, in honour of the 28th anniversary of the establishment, which has formed 23,360 good swimmers. The masquerade consisted of 1,200 swimmers, and the banks of the Spree were crowded with visitors to witness the extraordinary sight.—Letters from Frankfort announce the arrival of Prince Metternich in that city, on his way to Johannisberg.—From Vienna, we have accounts of the ceremony of laying the foundation stone of the suspension bridge now being erected across the Danube, to unite the cities of Pesth and Buda, which took place on the 24th. On the evening of the 22d the Archduke Charles arrived with a commission from his nephew, the Emperor Ferdinand, to represent him on the occasion, and was welcomed with illuminations of no ordinary splendour. He immediately took up his abode with his brother the Palatine, the Archduke Joseph. Of the gigantic work now in progress, two coffer-dams unequalled in cubical dimensions by any ever yet constructed, are now complete and watertight, being those on the Pesth side, whilst those on the Buda side are in an advanced stage. After the usual ceremonies were completed, the stone was laid in the presence of Count Szchenyi and Baron Sina, the chief promoters of the undertaking, and a large concourse of Hungarian nobility. The work is executed from the designs of our countryman Mr. W. Tierney Clark, civil engineer, to whom the Archduke Charles on this occasion, in the name of the Emperor, presented a gold snuff-box, with the cypher of the imperial donor emblazoned on it in brilliants. To Mr. Adam Clark, resident superintendent of the work, his Highness presented a gold box, set in brilliants, and gave 100 ducats (50*l.*) to be distributed among the men employed. The gold and silver trowel, executed by Messrs. Mortimer and Hunt, of London, on which is a representation of the proposed work in basso relievo, with the mallet, has been handed over by the Archduke to the National Museum, as a memorial of the undertaking.

ITALY.—Letters from Venice state that negotiations are in progress for the transmission of the Overland Mail through that city or Trieste, and that England will thus be relieved from the vexatious annoyances of the French Post-office. The conveyance of the mail by the proposed route will occasion little or no delay, and will cost a much smaller sum than is now demanded. The Emperor of Austria will permit the mail to pass through his dominions without charge, provided Austrian steamers are employed in conveying it to England. The plan is at this moment under the consideration of the Post-office authorities, and, if adopted, will make this country wholly independent of the French Post-office.—Accounts from Rome of the 25th ult. announce that the three steamers built in England for the Papal Government had at last reached that capital. They had already given proofs of the solidity of their construction, having, in the space of a few hours, towed three vessels, heavily laden, from the mouth of the Tiber to Rome. The banks of the river were lined with an immense crowd of people, curious to witness a spectacle so novel to them.—It was reported in Rome on the 23d ult., that the Russian Minister, on receipt of despatches from his Court, had waited on Cardinal Lambruschini, Secretary of State, with whom he had a lively altercation. Should the influence of Russia prevail at the Papal Court, Cardinal Lambruschini will be obliged to vacate his post in favour of Cardinal Bernetti, who has acted as Nuncio in Russia during several years. It was likewise stated that some differences had taken place between the Cabinets of Vienna and Rome, but nothing serious was apprehended so long as M. Lutzow, who is entirely devoted to the Court of Rome, should continue there as Ambassador of Austria.

SWITZERLAND.—The cantons of Berne, Soleure, Argau, and Bâle, have formed a kind of commercial union for the abolition of all international duties. Valais is threatened with an explosion. A liberal print having been severe on the clergy, the latter have accused the Government of tolerating such calumnies, have raised the cry of Catholicism in danger, and have appealed to an extraordinary convocation of the Great Council. The cantonal government has answered by a long proclamation. The Vaudois and Genevese unfortunately came to a serious combat during the sham fights of the camp of Thouars, and were so much excited, that shots were actually exchanged. One man was much hurt in the face, but the Commanders succeeded in restoring order before it became more serious.

TURKEY, PERSIA, AND SYRIA.—The accounts from Constantinople of the 17th ult., brought by the Levant mail, are destitute of importance. No intelligence had arrived from the Persian frontier, and the Porte appeared to entertain no apprehension of fresh hostilities in that quarter. The relations between the Ottoman Government and Greece had undergone no change. M. Mavrocordato remained completely inactive, and matters would necessarily continue in that state until the Cabinet of Athens should become more reasonable in its pretensions. Nothing had been decided with respect to Syria. The result of the last inquiry made by the Turkish commissioner had not transpired. It was reported that Sir Stratford Canning, during his last interview with Sarim Effendi, had proposed to introduce certain changes and modifications in the treaty of commerce concluded in 1839 between Great Britain and Turkey.—On the 15th three ships of the line and a few light vessels sailed from the Bosphorus, under the command of Vice-Admiral Mustapha Pacha, on a cruise through the Archipelago.—Private letters of the same date confirm our previous advices, that accounts from Erzeroum had been received, which positively announced that hostilities had ceased between the Turks and Persians, and that a suspension of arms had been agreed upon. The Schah had suspended his armaments, and given orders to his troops to withdraw from the frontiers. This satisfactory change of affairs was said to be due to the powerful intervention of England. The merchandise detained at Erzeroum, at the commencement of hostilities, had already been sent on to Persia. Within a few days a caravan of 2,000 horses had left for the same destination, escorted by a large force of cavalry, ordered by the Pacha of Erzeroum. The Persian Commandant received it at the frontier, and sent an escort with it to continue its route. The Porte had an intention to accredit, as soon as possible, an ambassador to Teheran, to terminate all the differences by diplomatic negotiations.—Advices from Beyrout announce that the French squadron, under Rear-Admiral Lasusse, arrived there on the 8th ult. It consisted of two ships of the line, two frigates, and three smaller vessels. The British squadron was also shortly expected. Some months since an officer of a French brig of war having been insulted by two Albanian soldiers, the regiment to which the latter belonged was transferred to Tripoli. The same brig having subsequently been ordered to that town, the Albanians, anxious to avenge themselves, waylaid the officer, stripped him of his clothes, bound his hands, and beat him in a most cruel manner. Admiral Lasusse, on being apprised of this fresh outrage, detached thither two brigs of the squadron to demand satisfaction. It was reported at Beyrout that England, Austria, and France were determined to re-establish the dominion of the Emir Beschir.

EGYPT.—Our accounts from Alexandria come down to the 22d ult. The Pacha issued fresh orders on the 18th for the fleet to hold itself in readiness to put to sea, and in the course of a few days three months' provisions were shipped on board. The vessels under sailing orders were 18 in number, including six ships of the line and two frigates. The admiral, Said Pacha, who left on the 6th for Lower Egypt, was daily expected at Alexandria. The Nile steamer, with the eight horses intended as presents for King Louis-Philippe, was to sail on the 25th, directly for Marseilles. The Government had drawn from the different Administrations of Cairo a sum of 25,000 purses, which was employed in paying part of the arrears due to the civil and military officers, who had been left without pay for the last two years. Additional funds had been likewise procured by large sales of various articles of consumption effected on the 12th and 19th ult. The Nile having reached the height of 18 ells, the *haliche* or embankment of the canal of Cairo was cut with the usual ceremony on the 17th ult. This rise in the river was considered to insure an abundant harvest in Lower Egypt, and an additional increase of four ells would produce the same beneficial effect in the upper part of the country.

INDIA.—The following are the details of the intelligence received on Saturday, of which, from the late hour of their arrival, we were unable to give more than a brief summary in our last. These details satisfactorily prove that the accounts of the French telegraph were greatly perverted in their passage from Malta, and though much uncertainty and uneasiness still prevail in India respecting the evacuation of Affghanistan, the actual state of affairs is by no means so bad as the telegraph had announced. The withdrawal of the troops is of course the great object of interest in all the advices. It seems to be generally admitted that this measure was actually contemplated by Lord Ellenborough, and postponed for reasons which will appear hereafter. The facts relative to the measure—the period when it is to take place—and the policy which is to be adopted in the interim—are thus stated in the papers. About the 29th of May, General Pollock received a despatch from Lord Ellenborough, directing him to return to India, if possible, immediately. Conceiving that by acting on these instructions, the interests confided to his charge might materially suffer, he wrote to the Governor-General stating his objections; there being far too little carriage for the transport of the troops and stores, no water on the road, and much difficulty to be apprehended in surmounting the heights of the Khyber, at this season, should any opposition be offered. Some few days after the despatch of this letter, all the preparations which had been making for retirement were postponed; and, on the 13th June, the General received a reply, in which his lordship, though by no means countenancing the idea of a permanent stay in Affghanistan, or any scheme of ultimate conquest, or retributive hostility, gave him permission to remain until the season was favourable for return, and he should have procured sufficient carriage, cattle, and stores to ensure the safe progress of his troops through the pass. Lord Ellenborough also instructed him to send out detachments for the purpose of destroying the forts and strongholds between Jellalabad and Jugdulluck, and thus displaying our power to the inhabitants of the surrounding villages. When the report was first circulated in the camp that our troops were to be immediately withdrawn, General Pollock is said to have been exceedingly angry, and directed the different officers to be assembled, and admonished as to the bad policy of spreading such reports. The next day an order was issued for the selection of a piece of ground, at Char Bagh, for the encampment of the force, and these measures were looked upon by some as decisive indications of General Pollock's intention to proceed eventually to Cabul, while by others they were considered in the light of deceptions. The ground was taken up on the 27th May, and the officers instructed to hold in readiness to march, but the encampment has never been changed. In regard to future movements the accounts are highly contradictory. One statement asserts that, notwithstanding the contradictory nature of the reports in circulation, and the contrariety of the opinions which have been held by different writers, it may be confidently said that it is the Governor-General's intention to withdraw, as soon as the season is favourable, and without any attack on the capital, the whole of the forces beyond the Indus; and that should our countrymen and countrywomen now in captivity not be released when the time for withdrawal arrives, their release will be left dependent on subsequent negotiations. The opposite accounts admit that a withdrawal at this conjuncture is calculated to inflict a most serious injury on the supremacy of Great Britain, but they maintain that the arrangements made by the Supreme Government lead rather to the inference that it was intended to use the most determined measures for obliging the refractory Affghans to enter into satisfactory terms. Of those measures, one was the formation of "a large army of reserve," in the district of Sirhind, under the command of Sir Jasper Nicoll. The name given to this force, which was ordered to amount to 20,000 men, together with the locality selected for its immediate assembling, in the neighbourhood of the Sikh country, and the appointment of the commander-in-chief to be its general, led to the supposition that it was not intended merely to protect the retirement of the British troops from the banks of the Indus, but to aid their future operations in Affghanistan. Another of those measures was the collection of beasts of burden, which were to be sent to General Pollock at Jellalabad. A body of the Sikh troops, amounting to 7,000 men, had also arrived at Jellalabad, which position they are described as anxious to maintain, even if the British be withdrawn. The negotiations, which were some time ago regarded as calculated to bring about a settlement with some parties of the Affghans, having terminated without any favourable result, the accounts now alluded to conclude that it cannot be supposed that the British troops, amounting now to 25,000 men, and fully capable of restoring our character in Central Asia, are to evacuate the country in the face of an exulting foe. It would be useless to attempt to reconcile these statements. It may, however, with certainty be affirmed, that no measure was ever proposed by a Government which men of all parties in India have so decisively condemned as the proposed withdrawal. The papers in all the Presidencies unanimously declare, that to retreat from a country where our envoys have been murdered, and our troops butchered, without making one effort to retrieve our honour, or rescue the captives, would be in the eyes of all Asia the deepest humiliation we have ever suffered. "If," they ask, "we were thus to show our subjects that we have at length met our equal, our superior in the field, and have been ignominiously expelled from a country we had subdued, and which all our resources were unable to re-conquer—what other inference can we draw, than that the term of our Indian empire is drawn to a close?" The Government papers state that the plan for the next campaign, now in a state of preparation, is said to have been arranged by the Duke of Wellington in England, and will be to the end of having not only an effective army of reserve in case of any future reverses, but at the present moment of concentrating all the troops in Affganistan in proper positions, until the opportune time shall arrive of a simultaneous advance on Cabul of the divisions under General Pollock from Jellalabad, and of General Nott with his division from Candahar. The caution and reserve with which the final determination of the Supreme Government is kept secret, and the absence of all public documents on the subject, had thrown an air of mystery over the matter, which was favourable to the conjectures on both sides. In the mean time events of varied importance have occurred in Affghanistan. The fort of Khelat-i-Ghilzie has been evacuated in consequence of the concentration of General Nott's division at Candahar. The Affghans, however, prior to the execution of that order, attacked the former place in considerable force on the morning of the 21st May; they were, as stated in the accounts of last month, repulsed with considerable loss. The official despatches published by the Governor-General at Allahabad on the 2d July, represent the conduct of Capt. J. H. Craigie and his troops as worthy of the highest praise. Official details have been published of the attempt made by Akhbar Khan, at the head of 3,000 men, and in conjunction with the rebel force under Prince Suftur Jung, the fourth son of Schah Soojah, and Atta Mahomed, to take the city of Candahar by surprise, during the absence of Col. Wymer, detached with a large force into the Ghilzie province. On their appearance near the city on the 29th of May, Gen. Nott sallied out at the head of a number of his remaining troops, and soon routed them completely. Prince Sufter Jung, having been deserted by his followers, had subsequently surrendered himself. There were letters received from the Army at Candahar, which comment strongly on the impolicy of abandoning the country, some of which, written by persons whose opinions are said to have high value, maintain that the force under Gen. Nott was fully adequate to advance even to the gates of Cabul.—From Jellalabad accounts are conflicting of the state of the troops, some exaggerating their want of comforts and the prevalence of sickness. On the other side, the fact is known that instead of retiring, Gen. Pollock had sent out a detachment to attack some forts ten miles to the southward. A brigade was formed, and placed under the command of Brigadier Monteith. The Colonel started on the 17th, and encamped the same night at a place called Ali Boghan. Here a most unfortunate event occurred. Some of the men belonging to Her Majesty's 31st went into the village, and saw there, in the possession of the villagers, several knapsacks and articles of apparel which had belonged to the ill-fated 44th Reg., which was all but annihilated on the disastrous march from Cabul. They became greatly excited at the sight of these relics, and before it was possible to interfere, the place was furiously attacked and burned to the ground. Unanimity and good feeling continued to animate all the troops at Jellalabad, and a strong desire was exhibited for going forward to Cabul, in order to avenge their slaughtered countrymen, and to wipe out the stain from the honour of the British Indian Army. The Affghans were divided among themselves, some being eager for forming conventions and terms of amity with the British. The delays in the movement towards Cabul since the passage of the defiles by Gen. Pollock's force had proved rather advantageous to Akhbar Khan, who having placed his British prisoners in safe custody at some distance from Cabul, proceeded, as we mentioned last week, to attack the Bala Hissar, in which Futteh Jung, the third son of Schah Soojah, who is looked upon as attached to the alliance with the British, had defended himself and his father's treasures with ability. The report of money being collected in the Bala Hissar roused the cupidity of Akhbar Khan and his followers; they, therefore, laid siege to that fort, and succeeded in completing a large mine under one of the bastions, which they blew up, with such want of skill as to kill numbers of their own men.—The latest letters from Jellalabad, to the 26th of June, represent the troops as on the best terms with the natives, who furnished all sorts of supplies. The detachment sent to the southward had received a promise of having 32,000 rupees, buried by Captain Ferris during the retreat of last year, and which the natives had discovered, made good to that officer. There were strange rumours current then among the Walnees near Jellalabad; one of which was, that Akhbar Khan having been persuaded by Futteh Jung to enter the Bala Hissar, was there detained a prisoner. This fact, if it be confirmed, cannot fail to produce the most important results. The movement of General Pollock's division on Cabul, a distance of 90 miles, was positively asserted to have been decided on. The presence of the 7,000 Sikh troops at Jellalabad was calculated to facilitate his progress.—In the interior of India tranquillity prevailed. The disturbances in Buldelkund, which are described as periodic, were to be put down by 5,000 men, who were ordered to occupy those districts after the rainy season. The inhabitants are said to be always tranquil during the presence of troops.—From the Presidencies we learn that the Governor-General has decided on a measure which was exaggerated by certain parties into an attempt to reduce the salaries of civil servants. It is the appointment of a select committee to examine into the causes of the annual increase of the civil charges in Bengal and the north-western provinces, there being nearly 1,000,000*l.* sterling difference between 1835 and 1841. Lord Ellenborough does not, it appears, intend returning to Calcutta for some months, but it is thought probable that his council will be directed to join him.—At Madras, numerous criminal informations have been exhibited against the late resident at Tanjore, Captain Douglas, for acts of gross bribery and corruption, committed whilst holding that appointment. Captain Douglas has sought to evade punishment for these offences by flight to a foreign settlement.—From Bombay we have some accounts respecting the unsuccessful attempt to burn the Adelaide, noticed in the last mail. Not many days elapsed before the attempt was repeated; and on this occasion it unhappily succeeded. The ship was about to sail, laden with opium, cotton, and piece-goods, for Singapore and Siam. The captain, who was on board at the time the fire broke out, set sail and ran her a-ground, where she was scuttled. The cargo, which was uninsured, was utterly destroyed. Fifty-six thousand rupees was the sum insured on the block. There was then no doubt that the whole of the fires which had occurred were attributable to incendiarism. The men who had been committed on a charge of being concerned in the burning of the vessels were brought up at the sessions, but discharged without trial, there not being sufficient evidence to convict them. A number of letters of Sir A. Burnes have been published in the "Bombay Times," originally addressed to Sir W. Macnaghten on the state of the country for some months preceding the outbreak: they defend his character very completely from the charge of indifference and want of information which had been brought against him. The accounts say that it is painful to peruse the Envoy's supercilious notes to these letters. The Bombay papers state, that he was determined, apparently, neither to see himself nor to believe any one else who could foresee the result.

China.—The British troops, under the command of General Sir Hugh Gough and Admiral Parker, having on the 10th of March defeated the Chinese Army, commanded by General Yih, and taken the city of Chinhae, marched upon the city of Tsekee, near which another Chinese force of from 8,000 to 10,000 men were strongly posted on some hills, commanded by Generals Twan-Yung-Yang, and Choo. Arrangements were made for an attack in three columns, two of which were gallantly led by Sir H. Gough and Sir W. Parker in person. Nothing could exceed the eagerness of the troops. They contrived to surround the Chinese, and quite bewildered them. The carnage was dreadful, being more a butchery than a battle. Ignorant of the laws of civilised warfare, the Chinese knew not how to surrender, and were massacred. Not less than a thousand of them, including a great number of Mandarins, were killed, or drowned in the canals. Large quantities of stores, baggage, &c., and a large proportion of cannon were taken, forty 18-pound carronades being among the number. Besides the 1,000 slain, there were vast numbers wounded, who were carried off, and three Mandarins are prisoners. The attack was made on an almost impregnable position, if properly defended, but was successful at all points and conducted with the utmost bravery. The casualties on the side of the British were, as heretofore, comparatively trifling, and the proportion of officers wounded shows the eagerness of the whole to engage with the enemy. Lord Saltoun had passed Singapore with his expedition, and Sir H. Pottinger awaited his arrival at Hong Kong; with it he would proceed to the mouth of the Pei Ho, and it was supposed Pekin would be immediately attacked. Until this happens the officers considered that there was apparently no chance whatever of any conclusion to the war, and that the occupation of the cities of Ningpo and others near it, though doubtless drawing off attention from Pekin itself, was but a waste of resources, which had better be applied to a more definite object. Prize-money for the present was very plentiful, and the hearts of all concerned were gladdened at the prospect of making their fortunes at Pekin.—The Canton papers announce, as we stated last week, that the Emperor, apprehensive of a visit from the English, has retired into Tartary, and had, before his departure, magnanimously issued proclamations to his people, enjoining them to defend themselves to the very utmost. Some tidings had been at length received from Capt. Denham, of the brig Ann, which had been cast away on the Island of Formosa, and her crew made prisoners by the Chinese. Capt. Denham writes that, up to the 10th April, the date of his letter, he, Mr. Gully, and his crew were kept by the Chinese in four different prisons, not far from the sea-side, almost opposite to Chimoa, and were very severely treated. Nothing has been heard of the shipwrecked crew of the Nerbudda.

CITY.

Money Market, Friday.—Considerable parcels of money stock have been thrown on the market, and Consols have in consequence declined ⅛ per cent., the last price being 93 to ⅛ for the account, and 92⅞ to 3 for money. Three-and-a-Half per Cents., 101⅞; Three-and-a-Half per Cents. Reduced (shut), 101¾ for money; New Three-and-a-Half per Cents., 101⅛ to ¼; Exchequer Bills, 51*s.* to 53*s.* prem.

Metropolis and its Vicinity.

The New Houses of Parliament.—It is now announced that the works of the Victoria Tower are in such a state of forwardness that Mr. Barry is in expectation that in six weeks, or two months at the latest, they will be sufficiently advanced for the first stone of the new houses to be laid, the present buildings in course of erection being the Parliamentary committee-rooms and offices. The great tower, which, from its altitude, about three hundred feet from the ground level, will constitute the leading feature of the new edifice, is constructing over the central hall, between the two houses. Into this structure all the ventilating flues of the entire building will be carried, to enable the accumulated air to escape from its summit. The ceremony of laying the first stone will probably be performed by her Majesty in person or by Prince Albert. The estimated cost of erecting the ventilating tower alone is said to be upwards of 20,000*l.*

Metropolitan Improvements.—The workmen employed in taking down the steeple of St. Martin's Church have accomplished their labours, and on Saturday commenced the reconstruction of it. About forty-five feet have been removed, at which point the electric fluid was found to have passed off. The stones of the steeple were in a very shattered state.—Towards the close of last week the Boccius light which has been long in progress at Charing Cross, was lit for the first time. Its novel appearance attracted a large number of spectators. It lights the whole space between the Post-office and Cockspur-street, the Strand beyond Craven-street, and as far as St. Martin's church on the north. Nelson's column, in Trafalgar-square, though masked at present by the scaffolding, appeared as if standing out in broad moonlight; the gas-lights surrounding King Charles's statue were found to be unnecessary, and were extinguished. The advantage to persons having business at the Post-office will be sensibly appreciated, as the smallest print or writing can be there distinctly read. The light is peculiarly white and soft, and free from all quivering and unpleasant effect on the eye.—A memorial to the City Commissioners of Sewers to pave Old Broad-street with wood, instead of stone, signed by the professional gentlemen and merchants occupying houses in the street, has been presented to the proper quarter, and it is expected that the application will be favourably considered by the Commissioners, as the street is now undergoing repair.—The committee of paving for the parish of St. Mary-le-Strand have decided to pave with wood that part of the Strand from Somerset House on the south side of the church, to the boundary of the parish next St. Clement Danes; the alteration will add much to the comfort of individuals attending divine service in the church, as, from the increased number of vehicles traversing that immense thoroughfare, it frequently happens that the minister is scarcely heard.

Court of Aldermen.—At the meeting of the Court on Thursday, the measures taken to fill up the vacancy in the mastership of Whitecross-street prison, caused by the death of Mr. Barrett, were reported. The salary is to continue at 600*l.* a-year; and it is expected that Mr. Burdon, who has been temporarily appointed by the Sheriffs, will be confirmed in the office.—The Town Clerk read a presentment made by the grand jury a few days ago in the Central Criminal Court, complaining that a number of paltry cases had been submitted to them; that several of these cases had been charges against persons not accused before, and that the magistrates ought to have dealt summarily with them, instead of sending them to such a tribunal; that the gaol of Newgate was crowded with female prisoners; that there was great want of accommodation for witnesses about the Court; that males and females were not kept apart from each other, and that the latter were taken by the police officers to the public-houses in the neighbourhood, to the serious peril of their morals. Alderman Brown said there were certainly several observations in the paper just read which deserved serious attention. At the same time, many of the evils could be only remedied by the Legislature or the Secretary of State. Those which it might be in the power of the City authorities to remove or modify, could be best ascertained by referring the presentment to the Gaol Committee, and, no doubt, the most effectual means would be adopted to accomplish the object. The alderman then moved that the presentment should be referred to the committee; and after a desultory conversation, the motion was unanimously agreed to.

Public Meetings.—On Thursday a meeting of merchants, traders, and others connected with the commercial interests of the city, was held, for the purpose of receiving a report from the committee appointed in May last, to watch the proceedings in Parliament having reference to the reform of the bankruptcy law so much desired by all parties connected with mercantile transactions. After referring to the suggestions offered by the committee, which had been generally adopted by Government in the construction of the new act to come into force on the 11th Nov., the report concluded as follows:—"On the whole, your committee congratulates the trades upon the passing of this important statute—a measure which, by bringing within the jurisdiction of the Court of Bankruptcy in London a much wider field of operation, by the appointment of local commissioners and official assignees throughout the country, similar to the London system—by the additional checks against fraud by official assignees, the punishment of fraudulent debtors, the facilities afforded to creditors for bringing their debtors within the control of the bankrupt law—and by vesting in the Court the sole power of granting or withholding the certificate, will contribute most materially to the protection of traders against fraud and dishonesty, and at the same time facilitate the discharge of the unfortunate but honest debtor."—The committee appointed to receive subscriptions for the relief of the sufferers from the fire at Hamburgh have just published their report, by which it appears that the whole sum which has passed through their hands is 27,567*l.* 19*s.* 7*d.*, besides contributions made in different parts of the country, amounting to about 13,000*l.*, exclusive of clothing and other articles; and that the total amount received by the committee at Hamburgh from all countries, up to the 5th July, is 268,890*l.* Great as these contributions are, the committee remark, while expressing their gratitude, that but little assistance has as yet been afforded in comparison with the damage done.

Custom House.—We alluded in our last to the investigation now in progress at the Custom House, respecting the alleged frauds in the landing department. The daily papers have announced that Mr. Hastings, nephew of the Collector of Customs at Limerick, has been dismissed the service, the board having come to the conclusion, after the most deliberate and anxious inquiry, that he was guilty of aiding and abetting in frauds upon the revenue. Mr. Hastings was a landing-waiter of some standing, and had hitherto borne a high character. The only other officers at present charged with participation in the frauds are five landing-waiters; their cases are now undergoing investigation; meanwhile they are suspended. The inquiry already goes far to prove that some of the very first houses in silk mercery in the city are implicated. There are no less than four Surveyors-General sitting on the charges, and reporting to the board the evidence taken, so that the matter may be prosecuted and brought to a conclusion with all possible despatch.

Post Office.—It is stated that the Postmaster-General has decided on returning to the old method of paying the guards on mail-coaches 10*s.* 6*d.* per week, and allowing them to take fees from passengers. The guards on railways are still to be paid salaries without fees: but such salaries are to be on a reduced scale. The cause of the contemplated alteration in the mode of paying the mail-coach guards is, the continued discoveries that they receive fees. Six of them are now suspended for taking fees; but Lord Lowther has resolved not to dismiss them, because he declares it impossible to prevent persons who are paid only 70*l.* or 80*l.* a-year from taking gratuities from passengers, when, as in most cases, it has happened the gratuities have been voluntarily offered.

British Museum.—Circulars have just been issued from the Museum to all the publishers in the kingdom, calling their attention to the new Copyright Act, by which it is directed, under certain penalties, that a copy of every book, pamphlet, sheet of letterpress, sheet of music, map, chart, or plan, published within her Majesty's dominions, shall be delivered, on its publication, at the British Museum. The provisions of the said Act to be enforced in every case in which any of the above-named species of publication shall not be delivered as the Act directs.

Westminster.—The valuable preferment, vacant by the death of Dr. Ireland, the Dean of Westminster, on Friday morning, is the most lucrative deanery in the church, its revenues, it is said, exceeding many of the bishoprics. It is a collegiate deanery, and had been held by the late Dean many years. The Senior Prebendaries of the Chapter, the Dean of Ripon, the Rev. Dr. Causton, and the Rev. W. Bentinck, will administer the affairs of the deanery until the appointment of a successor. Dr. Ireland had nearly completed his 81st year, having been born on the 8th Sept., 1761.—The Dean was buried on Thursday, in Poet's Corner, in the grave of his early friend, John Gifford, first editor of the "Quarterly Review." The ceremony was attended by a large number of the metropolitan clergy, and the service was read by Lord John Thynne, the sub-dean of the Abbey.

Metropolitan Antiquities.—During the excavations now in progress in Water-lane, Fleet-street, for the construction of a new sewer, the workmen came against the foundation of the wall which is believed to have formed the eastern boundary of the Monastery of Whitefriars. It extended nearly to the top of the street from the river. The materials consisted of slate, flint, brick, and granite, mixed with mortar, and the construction was of the most solid kind. At one part of the sewer, in consequence of the strength of the wall, they were obliged to tunnel through it. Several pieces of money, some bones, two skulls, and a coin of the reign of Charles II., were found at a depth of about 14 feet. The foundation wall of the monastery on the west side was discovered about two years ago at the corner of Lombard-street. The house was burned down, when in digging the ground, the men came to the foundation stones of the gates leading into the monastery. The precinct of the Whitefriars, which consists of a few streets, alleys, and courts, is now formed on the ancient site of the monastery of that name.

Greenwich.—The commissioners of Greenwich Hospital have directed that the Chapel, as well as the Painted-hall, shall be open to the public gratuitously, on Mondays and Fridays, from the hours of ten o'clock until six. No persons, however, who are not respectably attired will be admitted.

Kentish Town.—It is now decided that the new church in this suburb is to be erected on the site of the present parochial chapel, at a cost of from 5,000*l.* to 8,000*l.*, towards which the commissioners for building churches have agreed to make a grant of 800*l.* The church is to contain 1,668 sittings, one-half of which will be free. It is to be built in the early decorated Gothic style, after the model of the cathedrals at Rheims and Lincoln. Mr. Finch, the treasurer, has presented the trustees with a stained glass window, worth 500*l.*; in the centre of the catherine wheel of this window an illuminated dial is to be placed. The material of the church is to be of fine white brick, with decorations of vitrified stone, by which will be prevented that dilapidation and decay which have lately come over the Bath stone in Henry the Seventh's Chapel, the churches in Langham-place, and others lately built by the Church Commission.

The Weather.—On Wednesday evening the metropolis was visited by one of the most extraordinary storms which have occurred for many years past. At an early hour in the afternoon masses of heavy clouds gathered in the north-west, and a chilling breeze which sprung up about the same time indicated a change. A few drops of rain fell before five, and as the evening advanced faint flashes of sheet-lightning were occasionally seen in the south-west, but unaccompanied by thunder. Before eight the storm increased; the lightning became more brilliant, and the flashes followed each other in rapid succession. About half-past eight the effect of the electric fluid was truly magnificent—the whole expanse of the heavens, illuminated in a most beautiful manner, presenting one of the grandest scenes it is possible to conceive. From the bridges, the whole of the churches and public buildings, as well as the shipping in the river, might be clearly distinguished, and in the south the Surrey hills were equally perceptible. In the suburbs of Kennington, Vauxhall, and Camberwell the fury of the storm continued unabated until after 9 o'clock. The rain fell in torrents for nearly an hour, but before 10 the storm had visibly decreased in the vicinity of London, the clouds passing off in a north-westerly direction, from which point flashes of lightning were seen until a late hour. A storm of equal violence passing off in so short a period is of rare occurrence. The intensity of the light during the height of the storm caused great inconvenience to the drivers of vehicles in the metropolis, and several minor casualties occurred.—We have received from a correspondent the following account of a curious meteorological phenomenon, which was observed on Monday, the 29th ult., in the vicinity of Dorking. The north-eastern horizon was filled with an exceedingly heavy cloud, indicating an approaching thunder-storm. In the dense mass of vapour which always precedes the main body in a thunder-storm, a narrow strip of lighter-coloured vapour was seen to stream up, connecting, as it were, a lower cloud with one at a higher elevation. Its particles were distinctly seen to move with great rapidity, resembling, more than anything else, but on a much larger scale, the escape of vapour from the safety-valve of a steam-engine. The apparent length of the stream was from 30 to 40 feet, and its breadth 3 or 4 inches at the lower, and 8 or 10 at the upper extremity, where it seemed to lose itself in the mass of cloud. After rising almost in a perpendicular direction for a minute or two, it wound itself into a single coil near its middle, about 2 feet in apparent diameter, round which the particles continued to move as before, till at length the whole was hid by another cloud intervening between it and the observer. Half an hour afterwards, the storm, which had been gradually approaching, burst with intense fury over Mickleham and the neighbourhood.

Mortality of the Metropolis.—The following is the number of deaths registered in the Metropolitan Districts for the week ending Saturday, Aug. 27th: males, 470; females, 425; total, 895. Weekly average 1838-9-40-1, males, 467; females, 445. This mortality was distributed over the different districts as follows: West District, 129; North District, 167; Central District, 170; East District, 219; South District, 210.

Provincial News.

Birmingham.—During the past week this town has resumed its usual tranquil state, and but little fear is now entertained of any further attempt being made to disturb the peace. The number of colliers to be met with in the thoroughfares of the town is greatly diminished, and it is hoped that by the general resumption of labour in the mining districts they will speedily be relieved from this species of mendicity. The arrangements made by the authorities for the preservation of order and the protection of the town are viewed by all parties with feelings of great satisfaction, heightened by the fact that their exertions have hitherto been attended with success. The Chartist leader White, as we stated in our last, is now in Warwick gaol. Bail has been offered, but refused as insufficient, and he is likely to remain in custody.

Stafford.—There is an additional prospect now held out of a speedy settlement of the strike in South Staffordshire. Notwithstanding an unfortunate occurrence which followed the last meeting of magistrates and men, when two men were killed, there is every reason to believe that a good understanding will speedily be effected. Many masters have expressed a willingness to meet the men, and arrangements have already been made for the purpose. A man named Capper, a Chartist preacher, residing at Tunstall, in the Potteries, was arrested on Saturday, and conveyed to Newcastle; after examination he was committed for using very violent language on various occasions. At West Bromwich the resumption of labour was by no means so general on Monday as was anticipated. But it is understood that, in prolonging the turn-out for a few days, the men are only anxious to ascertain the feeling of the masters. With one or two exceptions all the masters in the district have consented to give the thick-coal colliers the terms they have demanded, and to discourage the truck and bildass systems.—On Monday a meeting of the magistrates and deputy lieutenants of Staffordshire was held at the Shire Hall in this city, for the purpose of taking into consideration the present state of the county. An unprecedented number of magistrates attended. Earl Talbot, the Lord-Lieut., was in the chair. His Lordship addressed the magistrates in a long speech, and concluded by saying that he believed the county at the present time to be in a better state than it had been for some weeks past, but they would deceive themselves if they supposed the evil to be at an end. Until the men freely and uncontrolled returned to their employment—until unintimidated they were able to resume their peaceful occupations, the evil arising from the present state of things could not be considered as conquered. It remained for the magistrates to adopt such measures of precaution as they might deem expedient and and advisable. Lord Wrottesley then proposed a series of resolutions, providing that stations be established in each hundred of the county, by which the police may be enabled to communicate anything that occurs relative to the movements of the people, and that horse-patrols be appointed under the direction of the magistrates. Some objections were offered by Mr. E. Buller, who deprecated interference between the masters and the men, and a long discussion ensued. Several magistrates agreed that the colliers were all peaceable and satisfied until they were influenced by Chartist misrepresentations, and that there were thousands now concerned in the strike who never before uttered the slightest complaint. One magistrate, Mr. Williams, said that the firm of which he was a member employed 1,500 men, and 100 of them had volunteered as special constables. Lord Wrottesley's resolutions were at length carried by a large majority, after a few verbal alterations.—On Wednesday a conference took place between several of the masters in West Bromwich and the delegates appointed by the workmen in the neighbouring collieries. The Earl of Dartmouth presided as Moderator, and in the midst of a large mass of conflicting evidence it appeared, that while some men were not realising more than eight shillings per week, others were getting from seven-and-twenty to four-and-thirty shillings. It appeared that, in many cases, the men had to complain of the operation of the bildass system, and of long quarter and half days without adequate remuneration; but upon the whole it was shown that great exaggeration had obtained prevalence in reference to their hardships. The proceedings were brought to a close by the butty colliers coming to a resolution to discontinue everything against which complaint had been urged, and by the assurance of the masters that they would discharge any butty against whom well-grounded complaints were hereafter brought.

Manchester.—The operatives, with few exceptions, still hold out in this town and neighbourhood, though no attempt has been made to disturb the peace. At the close of last week upwards of 700 spinners of Messrs. Birley, the extensive millowners in Oxford-road, had resumed work, but their power-loom weavers, amounting to several hundreds, still remained out, without any prospect of an adjustment. The neighbouring towns remained as before, with respect to the wages' dispute, and fears were apprehended that a breach of the peace would again be attempted unless labour were resumed. At Ashton-under-Line, 88 ringleaders of the turn-outs had been taken into custody, and examined before the magistrates in that town. In the neighbourhood of Stockport, Hyde, Ashton-under-Line, &c., there prevailed great discontent, and a spirit of lawless violence was manifested towards the manufacturers and those who have been compelled to appear before the magistrates as witnesses or prosecutors. Mr. Hanklyn, a manufacturer at Ashton, had been attacked by a mob within 200 yards from where the military were stationed, and was compelled to fire at his assailants in self-defence. Such was the state of affairs, that many respectable individuals deemed it unsafe to go abroad without arms in their possession. On Monday it was anticipated by many that a general resumption of labour would take place in these districts, but the expectation was not realised; on the contrary, there was a partial turn-out of the dyers connected with the works of Mr. Owen, of Gathorne. They demanded an advance of wages, and that demand being refused they left work. Nothing, however, occurred to disturb the general peace of the town, but it was evident that there does not exist that good feeling between the masters and men which it would be desirable to see. The delegates held a meeting in the morning, and agreed to an address to the operatives which has been extensively circulated; the leading resolutions state that "the delegates strenuously deprecate the conduct of the manufacturers, in not meeting them to settle the existing difference, as dishonourable and tyrannical in the extreme; that since the manufacturers have come to the determination not to meet the people through their delegates, to settle the difference now existing, the people are determined not to resume work again at the prices they left off at; and that the delegates recommend to their constituents that they stand firm and united, as they feel convinced that the masters can give the prices demanded if they will, but they are determined to use all their influence to starve the people into submission." In the course of the day Government offered a reward of 100*l.* for the apprehension of Dr. M'Dowall, the Chartist lecturer, and a report prevailed that he had been captured. It turned out, however, to be erroneous. Some individual who was apprehended in the course of the day was mistaken for him by the bystanders, and thus the story of his arrest got about. He is still at large, and many persons believe that he has left Manchester.—On Tuesday morning a large open-air meeting was held in Little Ireland, composed of artisans of all descriptions, but the majority were the power-loom weavers. Violent language was used, particularly by the females present, who declared they were starving, and that they would have bread, if they died in the attempt. A large police force was marched down to the spot, and dispersed the meeting. The masters are endeavouring to engage power-loom weavers who do not belong to the union, and the factory of Messrs. Morris, in Salford, has commenced, the hands resuming work without obtaining their additional demand. It is calculated that about 8,000 power-loom weavers are still out. The works of Messrs. Owen, dyers, continue to be worked, notwithstanding the turn-out of the union hands, those in work not belonging to the union. At Glossop, where the attack was made on Mr. Shepley's factory last week, all is peaceable, but the different factories are still idle.—At Salford the Sessions commenced with the trial of the Clifton rioters: the indictment charged them with a riot at Clifton, in the parish of Eccles, on Saturday, the 20th of August; with having riotously and tumultuously assembled together, to the number of 300 and upwards, and that whilst so assembled they turned out the colliers at Mr. Knowles's, and at other coal-pits. They were also charged, in another count, simply with a riot. All the prisoners pleaded not guilty, and did not avail themselves of their right to traverse. The evidence was merely a recapitulation of facts already before the public; but there was some doubt how far the indictment affected all the prisoners. The jury found six guilty, and acquitted the others, amounting to 35. The chairman, having consulted with his brother magistrates, said they would not sentence those convicted then, but they would consider what punishment to inflict. The jury had made a distinction between some of the cases. Undoubtedly, there were a few against whom the evidence was slight, but in other cases he did not see the distinction the jury had. However, he did not find fault with the decision of the jury; but it was necessary to inform those who were acquitted, lest they should leave the court with a wrong impression, that parties who were present at any assembly collected for an unlawful purpose (and they could not be so ignorant as not to know that the turning out hands from their work was illegal) were liable to be punished for breaking the law. Other prisoners have since been convicted, and sentenced to different terms of imprisonment, varying from 14 days to two years.

Stockport.—The manufacturers at the close of last week resolved to open their mills on Monday, and the working classes and Chartists, on the other hand, determined that there should be no resumption of work, except at the advanced wages. The cotton-mill of Messrs. Bradshaw, in St. Peter's-square, commenced work on Monday morning, and several hundreds of the turn-outs assembled in front of the mill, with a view of deterring the hands from resuming their employment; and consequently few returned to work. The engine, however, continued running, and the crowds assembled near the mill were driven away by the police, but they lingered in large groups at all the street-ends in the neighbourhood, and as near the mill as the police would let them go; and there is no doubt that were it not for the presence of the magistrates, police, and a number of special constables, an attempt would have been made to put out the boiler-fires and turn out the hands. Six or seven persons were taken into custody near the mill, for refusing to disperse. One or two other mills opened on the same morning, but they are again stopped, in consequence of so few of the hands going to work. No communication has yet taken place between the operatives and employers; and, at present, there is no prospect of the dispute being speedily terminated.

Lancaster.—The state of affairs in this town has not changed much since our last; but no attempt has been made to disturb the peace.—At Wigan all remains quiet, and the cotton-mills continue working full time. Some excitement was occasioned on Saturday, in consequence of the throstle-spinners employed at Messrs. Ryland's mill turning out at noon, without any intimation being given to the firm. An advance of 2*s.* per week is sought by some of them, though many are anxious to return at the old prices, were they not restrained by the others. Warrants have been taken out against the principals connected with the turn-out for leaving their employment without giving the stipulated notice, which proceeding may perhaps have the effect of quieting the persons who have been the cause of this outbreak. In the handloom weaving department there is considerable improvement as regards the demand for goods; and, consequently, labour is necessarily wanted. Weavers are now more generally employed than they have been for some time past. Notwithstanding an increased demand for goods, no advance has yet taken place either in the price of goods or of labour; and the only complaint is, the inadequate amount received by the weavers for their industry. Shopkeepers, and tradesmen generally, experience no improvement; nor can they see any symptoms of increasing prosperity at present.—At Preston the local papers report that the mills are all in full work, and that the town is now as if it had never experienced any disturbances. The temporary barracks for the 60th Rifles were completed in the early part of the week, and are now occupied by the men. The Furness troop of the Lancashire Yeomanry, under the command of Captain Michaelson, which have been stationed at Blackburn during the riots, marched into Preston on Thursday, and left again the following morning, on their route home. The detachment of the Wigan troop of the same regiment, which has been quartered here, has also marched to Wigan, where they would be dismissed.—At Rochdale the machinery in the cotton and woollen mills is in full operation, but there are a great number of operatives out of employment. At some few of the cotton-mills there has been an advance of wages, but of so small an amount that the hands appear much dissatisfied. Loud complaints are made against the wages given at various factories being unequal, and the operatives have published lists of prices given in the town and neighbourhood. Meetings are held every evening, where the men discuss their grievances. The woollen handloom weavers have held many meetings this week, and have solicited their employers to give an advance of wages; but they refuse to comply, alleging they cannot meet in the market with the power-loom manufacturers. The town is peaceable and quiet, and the special constables and pensioners have been dismissed.

Merthyr.—The local papers confirm the intelligence already given, that work has been resumed and tranquillity perfectly restored in this important iron district. The Chartist lecturers have attempted to produce another turn out this week, but the men seem perfectly contented, and as a good understanding with the masters prevails, there is no fear of any further disturbance.

Cardiff.—On Friday last the inhabitants of the village of Llantrissant, in this county, were shocked by the discovery of the murder of a child by its own mother, with her subsequent suicide. The unfortunate woman who committed this double crime was a Mrs. Evans, who with her husband kept a secluded but respectable public-house between Llantrissant and Tow-yr-Efel. The inn is well known to all persons travelling that road, and the characters borne by both Mr. and Mrs. Evans were highly respectable. During the absence of the husband, the wife cut the throat of their only child, a boy six years of age, and then hung herself. The details are of a very distressing kind, but it is unnecessary to advert to them more particularly. The wife appears to have suffered for some time from low spirits; but no fears were entertained that she would commit any act of violence. The Jury at the inquest brought in a verdict of Temporary Insanity.

Deal.—Mr. Bush, the engineer of the new lighthouse on the Goodwin Sands, has addressed another letter to the papers, stating that since his return from the Admiralty, he has minutely surveyed the caisson, and found that, after the late stiff breezes, it has adjusted itself to a more upright position; that there are 18 feet of water around it at low water, but at 20 feet distance there are only five feet—a basin has, therefore, been formed by the strong tides, which proves that he is but a short distance from the chalk. This opinion is confirmed by the caisson not having sunk for the last three weeks more than five inches. Mr. Bush says that men acquainted with the Goodwin Sands, and who know the few hours that a ship survives when upon them, can well appreciate the efforts already made, and that if the weather proves favourable, he has no doubt of succeeding in getting on some more cylindrical plates in the course of the week.

Liverpool.—A singular case recently occurred in this town. A merchant extensively engaged in the corn trade received, some months ago, from a correspondent in the Baltic, bills of lading for a cargo of corn which the latter pretended to have had shipped for the Liverpool market. Upon these bills, which appeared regular, advances to the amount of 2,600*l.* were made. A more than usual time elapsed and the vessel named in the bills of lading did not make her appearance. While the matter was in this state, the merchant accidentally met a shipbroker, from whom he heard, with surprise, that his foreign correspondent was actually in Liverpool, accompanied by his wife, intending to embark for America, and that the Captain whose signature was attached to the bills of lading had sailed hence about ten days before. It, therefore, became evident that the Captain's name had been forged to the bills of lading; that no cargo of wheat had been shipped by the forger of the bills, and that the merchant was one of several persons whom the foreigner had designed to defraud. The merchant sent a German clerk to discover the swindler, whom he fortunately found on the point of embarkation. The clerk pretended that a man who had accompanied him, and who was at hand, was a police-officer, and that if the foreigner (who could not speak English, and who was addressed in German,) did not instantly return the 2,600*l.* which he had fraudulently obtained, he would order him into custody. The plan succeeded: after some hesitation the money was refunded. On the same afternoon the foreigner embarked on board the Royal mail steamer, and sailed for Boston.—The execution of Francis Bradley, for poisoning his wife, took place in this city on Saturday. The night before the execution he wrote a confession, admitting the justice of his sentence.—A fatal accident occurred at Seacombe, on the opposite bank of the Mersey, on Saturday evening, at the house of Mr. Bevington, a tea-merchant of Liverpool. His wife's sister, a Miss Evans, and a servant, went into the river to bathe, and were carried off by the strength of the tide, and drowned before any assistance could be afforded.

Norwich.—A correspondence has been published in the Norwich papers respecting the inability of Spohr, the celebrated composer, to fulfil his intention of being present at the approaching festival, in order to conduct the performance of his Oratorio, "The Fall of Babylon," written expressly for it. At the last festival he conducted in person the performance of his "Calvary;" and the gratification which he received on that occasion induced him not only to engage to produce another great work for the next festival, but to make its performance the occasion of another visit to England. The Elector of Hesse Cassel, whose chapel-master he is, persists in refusing him a few weeks' leave of absence for that purpose. This refusal was rudely repeated, without even the courtesy of assigning a reason, when the request was afterwards made, first by the British Minister for Foreign Affairs, and next by the Duke of Cambridge, who is related by marriage to the Elector. This proceeding has occurred in a country which has been called the paradise of musicians. The "Morning Chronicle" states that never was such an epithet more misapplied, than to a country in which Mozart and Beethoven struggled all their days with neglect, and died in penury—where Haydn lived all his life little better than the domestic servant of a great magnate, unaware of the greatness of his own name, even when it was familiar as a household word all over Europe—where Hummel has been seen, at Weimar, waiting in an antichamber among his master's menials, till he should be called in to amuse the company—and where Spohr, without the civility of a cause assigned, has been refused permission to make a brief visit to England. Spohr himself is said to feel no anxiety as to his Oratorio. "I console myself," he says, in a letter to Professor Taylor, "with thinking that my Oratorio will be conducted by you. I have no anxiety respecting its performance." His confidence is based on the solid ground of experience, and will, we doubt not, be justified by the event. After giving the correspondence relating to this affair, the papers observe that our Germanised composers may now perhaps console themselves under the misfortune of being Englishmen.

Plymouth.—We learn, by the "Plymouth Times," that the Kite steamer arrived in that port on Friday, from the coast of Africa, bringing home the remaining officers and crews of the steamers which formed the late unfortunate expedition up the Niger. The Kite was despatched by Government to stay all further proceedings in that enterprise, and arrived at Fernando Po just as the Soudan and Wilberforce were about to ascend the river a second time. Capt. Allen and Capt. Ellis, Lieut. Frederick Sidney, Master W. Foster, Purser W. Bush, Clerk J. Terry, Surgeons R. H. Thompson and Morris Pritchett, and 22 seamen and marines, have arrived in her. The greater part of the seamen had volunteered at Ascension from the merchant ships. Lieut. Webb, of the Wilberforce, has taken that vessel up the river, with a boatswain, carpenter, and two white engineers, in order to bring away the survivors from the model farm; the rest of his crew are Kroomen; Mr. Webb, clerk, also accompanied him. Lt. Webb, who was senior mate in the Soudan, has been at various times in all the vessels of the expedition, including the Amelia tender, now at the Model Farm settlement, as his services were required. The Soudan had gone to Benibra.—The Lords of the Admiralty arrived here on Saturday, on an official visit. On Tuesday they were present at the launch of the Albion of 90 guns, one of the largest two deckers ever built. She is to carry thirty-two 68-pounders on her lower deck, to throw a broadside of 2,016 lbs. of metal; and is built on the principle of Sir William Symonds, surveyor of the navy. It is said that so many persons were never collected on any preceding ceremony of the kind. The ship was named by Mrs. Drake, daughter of Admiral Superintendent Pym, and glided off the stocks in gallant style without the occurrence of any accident whatever. Her measurement is, in length, 243 ft. 1 in., extreme breadth 60 ft. $2\frac{1}{4}$ in., burthen 3,110$\frac{1}{2}$ tons.

Portsmouth.—Experiments were made on Friday and Saturday at Spithead by Dr. Payerne of his process for preserving life under water for an indefinite period of time. Admirals Sir E. Codrington and Parker, Major-General Pasley, and several other officers and scientific individuals were present. General Pasley accompanied the Doctor in his descent in the diving-bell, which was lowered to the depth of 12 or 13 fathoms. The Doctor took with him some cylinders of highly-condensed atmospheric air, which he allowed to escape by degrees as the diving-bell descended, and was thus enabled to keep the bell free from water. He also took with him a small box, about the size of a cubic foot, which contained his chemical ingredients for purifying the air in the bell, and rendering it respirable. By these means, himself and the General remained under water for more than 20 minutes, without the slightest communication with the atmospheric air above. Others of the party descended with the Doctor, and all expressed their conviction of the importance of the discovery for all purposes of submarine research. The operations against the wreck of the Royal George have been carried on this season with greater activity than in any former year, but have attracted less notice, in consequence of those great explosions, which excited so much public curiosity and attracted thousands of spectators, having become unnecessary in the present state of the wreck, the remains of which are now buried in a shoal of mud only a few feet higher than the adjacent anchorage, so that Gen. Pasley has directed that no charges exceeding 200lbs. of powder shall be used. The wreck of the small vessel sunk about 50 fathoms south of the Royal George has been attacked this season. Corporal Harris, who has so much distinguished himself as a diver, had previously gone down to examine it, and reported that it was about 60 feet in length, and that the timbers could be traced all round, rising five or six feet above a small shoal on which it was partially imbedded, the upper part of the timber being worm-eaten and decayed. Not being able at first to ascertain the name of this little vessel, it was called the Perdita, but afterwards its history was discovered by consulting the letter-books in the Master-Attendant's office in this dockyard, and it proved to be a mooring lighter, employed by Mr. Tracy, in 1783, in his unsuccessful attempt to weigh the Royal George, and was sunk in that operation. The officers of the yard at the time reported to the Navy Board, that they had tried to weigh this lighter, but failed; and that though it was perfectly practicable to recover her by employing more men and vessels in a second attempt, her value would not even pay for the cordage that would be expended in the operation. She was therefore left at the bottom to be removed fifty-nine years after she sank, by a Corporal of the Sappers and Miners. No part of her is now left, the floor-timbers, kelson, planking, and keel, having been successively got up, but not without expending about 750lb. of powder, in charges placed from time to time by the same intelligent diver, of which the largest was 180lb.—none of the others exceeded 70lb. The demolition and removal of both wrecks has been going on with activity, never fewer than four or five, and now six divers, being constantly employed. On the 20th June, 3,065 cubic feet, or 61 loads of timber, had been removed from the two wrecks, besides 219 pigs of iron ballast from the Royal George, the latter weighing, at 3 cwt. each, 32 tons 17 cwt. Of these, one diver sent up 19 pigs, or nearly three tons, in one day. On the 30th of June, the quantity of timber stacked for sale in the dockyard amounted to 6,804 cubic feet, or 136 tons, from the Royal George, and 2,187 cubic feet, or 44$\frac{1}{2}$ loads, from the lighter. An additional quantity of iron ballast, &c., was also recovered. General Pasley was anxious that the whole of the timber got up this year should remain till the end of the season, but there literally was not room for it, without inconvenience to the service of the dockyard, and therefore the portion above mentioned was sold as a matter of necessity. From the wreck of the Royal George much fewer remains of the unfortunate crew have been brought up than might have been expected, only one perfect skull having been found this season. An 18-pounder iron gun was got up on the 27th ult., being the first recovered this season; but if the accounts furnished by the Ordnance Office at the commencement of these operations are correct, there ought still to remain twenty brass guns at the bottom. More than 4,000lb. of gunpowder have been fired against the wreck of the Royal George this season, chiefly in small explosions, not usually exceeding 70lb. each.

Preston.—On Monday, the Guild-merchant of this ancient corporation commenced with the accustomed ceremonies. At an early hour the day was ushered in by merry peals from the bells of the parish church, the streets being crowded by multitudes of strangers from various parts of the country. Cricket-matches and boat-races were the principal public amusements up to mid-day, when the business of the Guild formally commenced. After the usual address from the Recorder, a scholar of the Grammar School recited a Latin oration, in honour of the Guild. The festivities were continued on the succeeding days, in the presence of a great number of visitors who had been attracted to the town on the occasion. They comprised every description of amusement, both for the higher and lower classes, viz., boat-races, regattas, balls, bazaars, concerts, processions, fancy fairs, public breakfasts, masquerades, horse-riding, exhibitions, &c., the profits of which are to be devoted to charitable purposes, as has been the custom since the reign of Henry II.

Rugby.—A committee, consisting of the Chevalier Bunsen, the Archbishop of Dublin, the Duke of Sutherland, the Earl of Denbigh, the Bishops of Ripon and Norwich, Lords Delamere, Wenlock, and Stanley, Sir Grey Skipwith, Mr. Justice Coleridge, the Provost of Oriel and Archdeacon Hare, has been formed for the purpose of raising a subscription to accomplish the following objects:—First, to establish a prize, or some other institution for the promotion of sound knowledge, to be called by Dr. Arnold's name, either at Rugby or at Oxford, as hereafter may be deemed most expedient, to be enjoyed, in the first instance, by Dr. Arnold's sons in succession. Secondly, to erect some monumental memorial in the chapel at Rugby, where his mortal remains have been deposited.

Southampton.—Information has been received in town of a serious robbery committed on Thursday night, between the hours of ten and eleven, at the residence of Lady Lyall, at Milnbrook, near this town. The thief carried off a writing-desk, containing the sum of 4,000*l.*, the greatest portion of which consisted of 5*l.* Bank of England notes; it also contained a great many diamond ornaments and other valuable property in jewellery. A reward of 100*l.* has been offered for the apprehension of the thief, but no tidings of him have been obtained.

Spalding.—On Friday last, the inhabitants of the village of Quadring, near this town, were surprised by the report that Miss Mary Spencer, who kept a day-school in the village, and resided in a small cottage consisting of two rooms on the ground-floor, had been found murdered in her school-room. It appears that she lived alone, that the house had been broken into during the night, and that deceased was murdered while attempting to escape. A man called Howett, a labourer living in the same village, who is deaf and dumb, but perfectly sane, has been apprehended on suspicion.

Railways.—The following are the receipts of railways for the past week:—Birmingham, 15,720*l.*; Great Western, 14,336*l.*; Eastern Counties, 1,080*l.*; Greenwich, 798*l.*; Birmingham and Derby, 1,335*l.*; Great North of England, 1,569*l.*; Manchester and Leeds, 4,338*l.*; North Midlands, 4,387*l.*; Birmingham and Gloucester, 1,805*l.*; Blackwall, 1,234*l.*; Hull and Selby, 1,046*l.*; York and North Midland, 2,262*l.*; Midland Counties, 2,674*l.*; South-Western, 7,555*l.*; Edinburgh and Glasgow, 2,017*l.*; South-Eastern and Dover, 963*l.*; Northern and Eastern, 1,279*l.*; and Brighton, 4,401*l.*—The Manchester and Leeds Railway Company held their half-yearly meeting at Manchester last week. The report stated that the total receipts were 109,747*l.*, or an average of 4,221*l.* per week, which, with the previous receipts from June to December, 1841, gave an average of 4,356*l.* per week, while the expenses of working appear to have been at the rate of about 37½ per cent.—The total expenses chargeable on revenue during the six months ending 30th June last, were 45,044*l.*, including 6,436*l.* for rates, taxes, duty on passengers, and 8,508*l.* for maintenance of way. The gross total charges, including interest on borrowed money for the same period, is 78,151*l.* The net profits of the half-year at the disposal of the proprietors, with the addition of the reserve fund, warranted the declaration of a dividend of 38*s.* 6*d.* on the 100*l.* shares, of 16*s.* 6d. on the 50*l.* shares, and of 2*s.* on the 25*l.*, clear of the income-tax, besides a surplus of 6,935*l.* available for the next half-year. The proceedings were very harmoniously conducted.—The Hull and Selby Railway Company have declared a dividend of 10*s.* per share, a smaller one than appears to have been expected from the traffic returns. The cause of the dividend being less than anticipated, is said to be the extra expense to which the railway is subjected by the running of mail trains at different hours to those despatched on ordinary business. A resolution was also moved, empowering the directors to apply to Parliament for power to raise 250,000*l.* by a further issue of shares, to pay off the debts of the company, and leave a surplus for the efficient working of the concern.—The number of passengers conveyed by the South-Eastern Railway, in the week ending on Thursday the 1st, was 3,662, and the gross receipts 963*l.* 11*s.* 4*d.*—A special meeting of the Northern and Eastern Company was held on Wednesday, to consider the propriety of leasing the line for a given term of years. The chairman stated that a proposal had been made to the directors for this purpose, but that they would not take upon themselves to recommend it to the proprietors, unless they could thereby insure to the company a net profit of five per cent. upon the capital outlaid. After a great deal of desultory discussion resolutions were passed, recommending the directors to negotiate for the leasing of the line, and that a committee, consisting of three directors and four proprietors, be appointed to carry out the proposed negotiation, the result thereof to be reported to a special meeting. The question as to the disposal of 3,168 of the forfeited shares was deferred until the necessary arrangements should be made.

IRELAND.

Dublin.—It is now said that the Government has decided that the Rev. Robert Daly is to be the new Bishop, and that the delay in making the official announcement arises from the necessity of having the judgment of the Prerogative Court, pronouncing the Rev. gentleman as the duly-elected Dean of St. Patrick's, confirmed by the Court of Delegates, to which Dr. Wilson has appealed, preparatory to Mr. Daly's elevation to the bench. This would give Government the elevation to the Deanery, which in that event would become vacant.—The election of Mr. Hamilton for the University is now considered so certain by his supporters, that doubts are expressed whether Mr. Smith, the new Solicitor-General, will persevere in opposing him. Mr. Hamilton has issued an address to the electors, in which he pledges himself to stand for the University at the next election, in opposition to Mr. Smith, or any other candidate whatever. He says that he is at a loss to discover upon what public principle a new candidate is now put forward, and he does not think it possible that Government can feel itself warranted in lending its countenance, for the sake of a temporary convenience, however pressing, to this fresh attempt to disturb such a constituency as that of the University, and to exclude him, a warm supporter, and one who has been engaged in some hard contests for the Conservative cause, from that representation, unless it be on account of the opinions he entertains upon the education question, and the grant to Maynooth. He states that his opinions are opposed to the grants to the Board of National Education, and the College of Maynooth, and that upon these principles he will rest his claim to the representation.—A meeting of the Repeal Association took place on Monday, when an abstract of accounts for the half-year was laid before the meeting. It appears that on the 25th of March last, the amount of cash in hand was 218*l.* 17*s.* 9*d.*; the amount handed in from that date to the 1st September was 2,082*l.* 8*s.* 3*d.*, making a total sum of 2,301*l.* 6*s.* The expenditure for the six months is 2,047*l.* 13*s.* 10*d.*, leaving a balance in hand of 253*l.* 12*s.* 2*d.* Among the items of expenditure are advertisements and newspapers, 294*l.* 1*s.* 10*d.*; agents and clerks' salaries, 234*l.* 15*s.* 5*d.*; sundry expenses connected with the registries, with salaries to agents and clerks, 652*l.* 10*s.* 11½*d.*; postage, 49*l.* 1*s.* 10½*d.* The remainder of the 2,301*l.* 6*s.* is devoted to coals, car-hire, and miscellaneous items.—The papers inform us that his Holiness Gregory XVI. has sent to Mr. O'Connell a gold cross and medal, as a testimony of the estimation in which the head of the Catholic church regards her most distinguished lay subject in this country. Mr. Cullen, Director of the Irish College in Rome, now on his way to Ireland, has been charged to present to Mr. O'Connell these gifts of the Pope.

SCOTLAND.

The Queen's Visit.—In our last account of her Majesty's visit to this part of her dominions the royal squadron was at anchor on Wednesday night in Aberlady Bay, off Portobello, within a few miles of the port of Leith. The night was dark but calm, giving great effect to the bonfires on the coasts of Lothian and Fife, which burned all night long, and also to the lights hung at the tops of the Royal George and the rest of the squadron. About 7 on Thursday morning the Firebrand steamer ran alongside Granton pier, and landed her Majesty's carriages and several of the suite. About the same time the Shearwater and Black Eagle took the yacht in tow, and bore up for the landing-place dedicated to her Majesty, on the west side of the pier. Opposite Leith the Royal George was saluted by the guns of the battery in that harbour. The yacht came alongside the pier about half-past eight, when the Duke of Buccleuch and Sir Robert Peel instantly proceeded on board, to congratulate her Majesty and the Prince on their safe arrival. Her Majesty and his Royal Highness, on quitting the yacht, entered an open carriage, and immediately proceeded along the pier to the Edinburgh-road, amidst the loud cheers of the people. They were escorted by a detachment of the 6th Dragoons. At half-past nine the Queen passed the barrier erected at the city boundary, at the bottom of Pitt-street. Her Majesty looked remarkably well—indeed not in the least fatigued by her voyage. Prince Albert was not apparently free from the effects of the voyage. Her Majesty and his Royal Highness reached Dalkeith Palace shortly after eleven o'clock. About 10,000 persons, including above 5,000 of the Duke's tenantry and the respectable inhabitants on the family estate, were permitted to enter the park, and, by the means of the military, order was strictly preserved. To the surprise of the whole city, the Queen had nearly passed through Edinburgh before the Town Council were aware of her movements; they at length assembled in great haste, but were too late to overtake the procession. In the afternoon the Lord Provost and Council waited upon the Duke of Buccleugh, Sir R. Peel, and the Earl of Aberdeen, at Dalkeith, to express their regret that they had been unable to testify their loyalty towards her Majesty on her progress through the city. Her Majesty had been graciously pleased to anticipate the wishes of the citizens in arranging to visit the city on Saturday, in such a way that the thousands congregated in that metropolis might be fully gratified at seeing her Majesty among them. The illuminations on Thursday night were equal to the anticipations that had been formed. They were not only exceedingly general, but many of the devices exhibited great taste. The streets were completely thronged to an extent that surprised even the people of Edinburgh themselves. The town has been crowded during the whole week. It is said there are 50,000 strangers in it. Food and lodging are enormously expensive. Her Majesty's inferior servants, three in a room, have had to pay 10*s.* 6*d.* a night for a bed, while the officers of a superior grade were charged a guinea. Indeed, a guinea a night has been the usual charge for sleeping accommodation. On Friday her Majesty and the Prince drove about the neighbourhood of the Palace, unattended by the usual guard of honour. On Saturday, the day fixed for the Royal visit to Edinburgh, the preparations at the Castle for the reception of her Majesty had been completed at an early hour in the morning, and everything was arranged in the most complete manner long before her arrival. At nine o'clock the incorporated trades, the high constables, and other public bodies, assembled with their flags and insignia in front of the Canongate, and then filed off to the respective stations allotted to them in the programme published for the occasion. The Queen and Prince were loudly cheered as the procession advanced. About midway between the Palace of Holyrood and the Castle of Edinburgh, close by the Royal Exchange, were erected barriers, at which her Majesty stopped to receive the keys of the city, presented to her on bended knee by the Lord Provost. Her Majesty returned them to this functionary in the most gracious manner, and then proceeded slowly up the Lawnmarket until she reached the esplanade before the Castle-gates. All through the royal progress her Majesty was cheered in the most enthusiastic manner, which she acknowledged by repeatedly bowing to the multitudes which lined the streets. Her Majesty's arrival at Holyrood was announced by telegraphic signals, and in a moment the royal standard was floating from the topmost tower of the old castle, amidst the salutes of the artillery, answered by the guns of the Pique frigate, which lay in the Frith of Forth, off Portobello. The various objects of historical interest in the fortress were quite familiar to her Majesty; and she seemed at once gratified and surprised at the sight of "Mons Meg," whose fortunes she appeared perfectly well acquainted with. After examining this great piece of ordnance, Her Majesty next visited the Crown Jewel Office, where are deposited the Regalia of Scotland, and greatly admired those ancient insignia of royalty, so strangely preserved and so singularly discovered. Her Majesty, after expressing her gratification at all she had seen, left the Castle by Bank-street, and descended the Mound to Princes-street amidst the most enthusiastic demonstrations of attachment from thousands of people who lined the road and filled the windows of all the houses on the route. The procession then advanced along Princes-street, accompanied by similar demonstrations of loyalty. When it reached the corner of Charlotte-street, which is on a right line with the western end of the castle, the guns of that fortress fired another salute. The procession then moved slowly along Queensferry-street and the Dean-bridge to Dalmeny Park, the seat of the Earl of Rosebery, where the Royal party partook of a luncheon. The only thing which occurred to damp the proceedings was the fall of a scaffold on which some hundreds were collected to see the procession. Two persons were killed by this unfortunate accident, and several others were severely injured. After a short stay at Dalmeny, Her Majesty returned by the Leith Queensferry-road, proceeding along it to Seafield Baths, and thence to Dalkeith, by the Portobello-road. Throughout the entire route her reception was of the most enthusiastic description, and could not fail to make a happy impression on Her Majesty's mind. The morning, though very lowering, was tolerably fine; but in the evening the rain set in, and continued till after Her Majesty's arrival at Dalkeith. Sir R. Peel was in the carriage next to Her Majesty. At some places he was greatly hissed, and at others was loudly cheered. On Sunday morning, at half-past eight o'clock, Her Majesty and the Prince went out privately and walked for some time on the slopes of the gardens unattended by any member of their households. At eleven, divine service was performed at the palace, the principal dining-room being appropriated for the purpose. The Rev. E. B. Ramsay, of St. John's Episcopalian Chapel, Edinburgh, officiated on the occasion. In the afternoon her Majesty, in compliment to the custom of the country, relinquished her usual ride in the neighbourhood of Dalkeith, and was driven by the Duchess of Buccleuch in a pony phaeton, drawn by a pair of thorough-bred animals, through the grounds surrounding the palace. On Monday Prince Albert rode into Edinburgh, accompanied by the Duke of Buccleuch, and visited the Royal Institution, and some of the other public establishments of the city. He was in town as early as 10 o'clock. About 2, her Majesty held a levee at Dalkeith. All the presentable persons in Edinburgh had the honour of being presented to her Majesty. There were upwards of 2,000 presented, a large proportion of whom were ladies. The line of carriages was upwards of three miles in length; but it was by no means distinguished for the style of the several vehicles. Her Majesty was surrounded by the State officers in attendance upon the Royal person in Scotland; she looked in excellent health and strength, and, notwithstanding the fatigue of receiving so many individuals, seemed in good spirits. On Tuesday morning her Majesty and Prince Albert left Dalkeith for their visit to the Highlands. They were escorted through Edinburgh by a detachment of the Enniskillen Dragoons, under the command of Lord Athol, and were accompanied by Sir R. Peel and Lord Aberdeen. Immediately on the cavalcade arriving at the boundary of the city a royal salute was fired from the castle, and also from the Daphne frigate, lying in the Forth, off Leith, with the rest of the squadron that accompanied her Majesty to Scotland. On arriving at Queensferry, the royal party were received by Lord Hopetoun, the Lord Lieutenant, and a large party of nobility. They then embarked on board the Queen Margaret steamer, and were landed about noon at North Queensferry Pier, amidst the cheers of an immense concourse of spectators. Her Majesty immediately proceeded to the palace at Scone.

Perth.—On Tuesday morning her Majesty entered this beautiful county. After crossing Queensferry, the first object of interest that presented itself to the eyes of her Majesty was the ancient Royal Burgh of Inverkeithing. This spot maintained that reputation for loyalty on the occasion of her Majesty's passage through it which it earned "ages long ago," when it was the favo [illegible] of David I., King of Scotland, and his Queen, Annabella Drummond. From this spot to Kinross, the whole road was a scene of animation and rejoicing. On leaving Kinross her Majesty proceeded at a fast pace to the Bridge of Earn, the next place for changing horses. On her way her Majesty had to pass through the Carse of Gowrie, that richest of all scenes in Scotland, or perhaps in Northern Europe, and that spot which caused the Roman legionaries to exclaim, on first seeing it, "Behold the Tiber!—behold the Campus Martius!" Her Majesty was delighted with the scene, and expressed her gratification in the most agreeable manner. The Glenfarg or valley road was that selected for her Majesty to travel from Kinross to Perth. It is a comparatively new line, and is of a very romantic character; though, perhaps, less so than the old road, which was a Roman military highway. At the Bridge of Earn, the last stage in her Majesty's journey but one, the scene which presented itself to the eye as the Royal procession emerged from the Glen, and wound its way along the road which at that point traverses the Carse of Gowrie, was the most picturesque imaginable. The day was one of the most beautiful of the season. Shortly after leaving the Bridge, her Majesty sent off part of her suite to Scone, and, followed by three carriages, took the cross-road to Dupplin Castle, the seat of Lord Kinnoull, where she had luncheon. Her Majesty left Dupplin early in the afternoon, and entered Perth amidst the greatest demonstrations of enthusiasm and respect. The Town Council of the "Fair City" were in waiting for her Majesty. Her Majesty entered the Great North Road by the Cloven Craigs, and afterwards proceeded along to the South Inch. At this point the keys of the city were presented to her Majesty by the Lord Provost, and her Majesty then proceeded through Perth by the way of Princes-street, George-street, and the bridge over the Tay, to Scone Palace. Her Majesty was most cordially received in her progress through Perth, and appeared much gratified with the enthusiasm of her subjects. On arriving at the bridge the royal party were met by the Earl of Mansfield, hereditary keeper of Scone, who escorted her Majesty towards this ancient abode of royalty, which stands on the opposite bank of the river about two miles distant. The royal party reached Scone about four o'clock, when her Majesty and Prince Albert were immediately conducted to the apartments prepared for their reception, and in the evening honoured Lord Mansfield with their company to dinner. The multitude which poured into Perth from all quarters during Monday night and Tuesday morning was beyond all precedent. There were no fewer than 40,000 to 50,000 visitors. All was regularity and order, and no accident occurred. In the evening upwards of 500 gentlemen sat down to a banquet in the county hall, in celebration of her Majesty's visit, while bonfires and coloured lights illumined the neighbouring eminences. Her Majesty and suite proceeded northward at an early hour on Wednesday, passing through Dunkeld, where the royal party partook of luncheon with her grace the Duchess of Athol, to Taymouth Castle in the Highlands, the seat of the Marquis of Breadalbane.

Miscellaneous.

Translations of the Liturgy.—The attention of the committee of the Society for Promoting Christian Knowledge has been directed during the present year to the preparation and completion of several new versions of the Liturgy. The first of these is a version of the Liturgy of the Church of England into the Amharic or modern Ethiopic—the language of a great part of the country of Abyssinia. This has been translated by the Rev. C. W. Isenberg, a clergyman of the Church of England, in the service of the Church Missionary Society. During his residence as a missionary in Abyssinia he found a great want of such a translation, and upon his return he devoted himself to the accomplishment of the work. It is expected that these copies of the Liturgy will be useful, not only in affording to Christians in Abyssinia a clear view of the doctrine and discipline of the Church of England, but also in advancing Christian knowledge among the Mahommedan and heathen tribes by whom the Amharic is spoken. A translation of the Liturgy into the Turkish language has been undertaken by the Rev. Mr. Fieldshed, of the Church Missionary Society, assisted by a native of Constantinople. Great care has been taken to avoid the florid style of the modern Turkish, and to adapt the language, as far as possible, to Christian devotional usages. So great a desire has been manifested by many of the Turks to become better acquainted with the religion of England, that little doubt can be entertained of the usefulness of this translation. Portions of the Liturgy have been translated into Armenian. Modern Armenian has been chosen in preference to ancient Armenian, or Armeno-Turkish. The Prayer-book has been translated into modern Greek, and a large number of copies distributed. It has also been translated into French, Portuguese, Dutch, and portions of it, at the request of the Bishop of New Zealand, have been translated into the language of that distant country. The Old and New Testaments are also in course of translation into different languages, by clergymen and linguists connected with the society.

Religious Institutions.—The following list of the receipts of religious and benevolent institutions for the past year has recently been published. The total of the receipts of the societies marked with an asterisk include sales of publications :—

		£	s.	d.
African Civilisation Society		3,692	10	3

SPORTING.

TATTERSALL'S.—Thursday.—Only a few of the subscribers having returned from Warwick, the attendance was thin, and betting flat. Offers were made to lay 6 to 4 agst Attila, but no one would take less than 7 to 4; therefore nothing was done upon him. The prices of the others were as follow:

St. Leger.

6 to 4 agst Colonel Anson's Attila
8 to 1 — Mr. Ramsay's Cabrera (10 to 1 taken at once)
11 to 1 — Mr. Forth's Policy (taken)
12 to 1 — Mr. Ferguson's Fireaway (taken)
14 to 1 — Mr. Meiklam's Agreeable colt (taken)
14 to 1 — Colonel Peel's Seahorse (taken)
16 to 1 — Mr. Combe's Rosalind (taken)
30 to 1 — Lord Chesterfield's Artful Dodger (taken).

MARK LANE, Friday, Sept. 9.—The little English Wheat fresh up since Monday, sold at improved rates, and fine White was 2*s.* dearer.—There is still a good demand for Foreign at fully as high prices. Spring Corn of all sorts comes sparingly to Market, and there is no alteration in value, but it is difficult to sell Old Irish Oats excepting at a reduction.

F. W. Bellis, Hon. East India Company's Service, aged 66.

Price 7*s.*, illustrated with Wood-cuts of Birds, Cages, &c.,
A NEW EDITION OF THE
NATURAL HISTORY OF CAGE BIRDS; their Management, Habits, Food, Diseases, Treatment, Breeding, and the Methods of Catching them. By J. M. Bechstein, M.D.

"A very delightful book of its kind. . . . . . It seems to us an indispensable book for the bird-fancier."—*Spectator.*

"It will be welcome to every gentleman's library or drawing-room table. It is superbly got up, with an immense number of vignettes, and, in fact, rivals the beauty of the Annuals."—*Weekly Dispatch.*

London: W. S. Orr and Co.; and W. R. Chambers, Edinburgh.

UNIVERSITY COLLEGE, LONDON.—JUNIOR SCHOOL, Session 1842-43. Under the government of the Council of the College.

Head Master—THOMAS H. KEY, A.M., late Professor of Latin in the College.

Professor Malden, A.M., will instruct the Senior Greek Class.

The School will open on Monday, September 26.

The Session is divided into three terms, viz.:—from the 26th of September to Christmas, from Christmas to Easter, and from Easter to the 4th of August.

The yearly payment for each Pupil is 15*l.*, of which 5*l.* are paid in advance each term. The hours of attendance are from a quarter past 9 to three-quarters past 3. The afternoons of Wednesday and Saturday are devoted exclusively to drawing.

The subjects taught (without extra charge) are Reading, Writing; the Properties of the most Familiar Objects, natural and artificial; the English, Latin, Greek, French, and German Languages; Ancient and Modern History; Geography, both physical and political; Arithmetic and Bookkeeping; the Elements of Mathematics and of Natural Philosophy; and Drawing.

Any Pupil may omit Greek, or Latin and Greek, and devote his whole attention to the other branches of education.

There is a general examination of the Pupils at the end of each Session, and the Prizes are then given.

The discipline of the School is maintained without corporal punishment.

A monthly report of the conduct of each Pupil is sent to his Parent or Guardians.

Several of the Masters receive Boarders.

Further particulars may be obtained at the office of the College.

Charles C. Atkinson, Secretary of the Council.

The College Lectures in the classes of the Faculty of Medicine commence on the 1st October; those of the Faculty of Arts on the 15th of October.—August, 1842.

CASE OF DISTRESS. We, the undersigned, appeal to the Benevolence of the Public, and particularly to Gardeners, on behalf of the Widow of the late Robert Runciman, who is left with five children under ten years of age, wholly unprovided for. The late Robert Runciman was many years Gardener at Coptfold Hall, Essex, which situation he was obliged to quit three years since in consequence of the gentleman leaving the place; he was not able afterwards to obtain a situation in consequence of his numerous family, and he commenced jobbing Gardener, when he was unfortunately attacked with severe Rheumatism, which confined him for many months to his bedroom; and thus the little savings he had previously made became exhausted before his death. We know him to be a steady, sober, and industrious man, and therefore confidently make this appeal on behalf of "the widow and the fatherless," in the hope that it will meet with that attention which the circumstances of the case deserve.

We shall be happy to receive Subscriptions, however small, in her behalf, and we beg to state, in justice to Mrs. Runciman, that this appeal is made without her knowledge.

John Green, Gardener to Sir E. Antrobus, Lower Cheam, Surrey.
David Ferguson, Gardener to the Duke of Buckingham and Chandos, Stowe, Bucks.
Saml. Young, Gardener to W. Branston, Esq., Skreens, Chelmsford, Essex.

Mr. Charlwood, of Tavistock Row, Covent Garden, has also kindly undertaken to receive Subscriptions.

Proprs. of *Gard. Chron.*	1	1	0	D. Ferguson	1	0	0
W. Catleugh	1	0	0	J. Falconer	1	0	0
Jno. Green	1	0	0	J. A. Henderson	0	10	0

SHIPS FOR NEW ZEALAND, under Charter to the New Zealand Company, to sail as under mentioned, viz.—
FOR NELSON AND WELLINGTON:
INDUS, A 1, 425 tons, from London, 1st October.
For further particulars apply at the New Zealand House, Broad-street Buildings.

HODGSON and ABBOTT'S PALE ALE.—The above celebrated Beer, so strongly recommended by the Faculty, is to be procured only from E. Abbott, Brewery, Bow, Middlesex. The Trade not being supplied, the Pale Ale cannot be genuine if procured elsewhere.
City Office, 98, Gracechurch-street.

THE "ROYAL ESSENCE OF EGLANTINE" for the Handkerchief is prepared only by Mr. White, Chemist, 24, Cornhill, London, in bottles at 2*s.* 6*d.*, 4*s.* 6*d.*, and 8*s.* each. Where also may be obtained the "AROMATIC PUNGENT ESSENCE" so useful in Headaches, Fainting, &c., at 3*s.* each.

N.B. Public Offices and Merchants can be supplied with Postage Stamps and Envelopes in any quantity at Government Prices.

SUN-BURNS, FRECKLES, TAN, and other Disfigurements of the Skin, prevalent at this peculiar season, are pleasingly eradicated by that unique preparation, ROWLAND'S KALYDOR, a balmy odoriferous liquid, and now universally admired for its sovereign virtues in completely removing all cutaneous eruptions, and in rendering the complexion delicately clear and fair. It is invaluable as a renovating and refreshing wash during travelling, or exposure to the sun, dust, or harsh winds, and after the heated atmosphere of crowded assemblies. Gentlemen will find it peculiarly grateful after shaving, in allaying the smarting pain.

CAUTION.—Ask for "Rowland's Kalydor," and see that these words are on the envelope, with their signature and address in red: "A. Rowland & Son, 20, Hatton Garden, London;" the same are engraven on the Government Stamp affixed over the cork.

Sold by the Proprietors, and by respectable Chemists & Perfumers.

Printed by Messrs. Bradbury and Evans, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the Office, 3, Charles-street, Covent Garden, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, September 10, 1842.

Young's Nursery, noticed . 608 *a*
Zoological Society, terms of admission . . . . . . 609 *b*

BRIGHTON FLORAL AND HORTICULTURAL SOCIETY.—At its Third Annual Exhibition of Flowers, &c., the above Society will offer a Sweepstakes for Dahlias, open to the public, in three Prizes, viz., 1*l.* 10*s.*, 1*l.*, and 10*s.* Each pan to contain 12 dissimilar flowers, Seedlings excepted. Entrance, 5*s.*

R. Colling, Secretary.

CARNATIONS, PICOTEES, AND PINKS.—NATHANIEL NORMAN, Florist, begs to call the attention of the Nobility, Gentry, Amateurs, and his friends generally, to his select Collection, comprising the finest show varieties, with which he has gained twenty prizes this season at the following Societies: London Horticultural, Royal South London, South Essex, and Floricultural Society of London. Has 10,000 Plants now ready, in fine healthy condition.

Catalogues may be had on prepaid application.—Bull Fields, Woolwich.

MYATT'S BRITISH QUEEN STRAWBERRY, after two years' competition, still maintains its pre-eminence; and, in returning thanks to their numerous patrons and friends, J. and W. Myatt beg to say they can with confidence recommend it as the most superb fruit yet known.

Also their new Seedling Strawberry Prince Albert, which for productiveness and size cannot be equalled. Price per 100, each, 50*s.*; and their Eliza, 20*s.* Runners are now ready, and may be had on application to them at Manor Farm, Deptford.

Myatt's famed Victoria Rhubarb, 50*s.* per 100 sets, or 1*s.* 6*d.* per root, will be ready in October.

FERNS.

WM. PAMPLIN, NURSERYMAN, LAVENDER HILL, WANDSWORTH, begs to invite attention to his Collections of that beautiful tribe of Plants—the Ferns. W. P. offers strong healthy Plants in pots at prices varying from 9*d.* and 1*s.*, to 10*s.* each, according to rarity of species, &c.

W. P. will also supply ASSORTED COLLECTIONS as follows:

	£	s.	d.
A Collection of Forty species for .	2	2	0
,, of Twenty ,, . .	1	5	0
,, of Twelve ,, . .	0	15	0
,, of Six ,, . .	0	7	6
A Collection of Thirty Species, all sub-hardy and hardy Exotic . .	3	15	0
,, of Twenty-five ,, .	3	3	0
,, of Twenty ,, .	2	10	0
,, of Twelve ,, .	1	10	0
,, of Six ,, .	0	12	0

Wardian cases of Ferns, or Ward's portable Greenhouses, of various sizes and prices, with the Plants, from Seven Shillings and Sixpence to Two and Five Guineas.

⁎ Wardian Cases fitted up and furnished with Plants at very moderate prices.—Lavender Hill Nursery, Sept. 10, 1842.

TO GROWERS OF HYACINTHS, AND OTHER DUTCH BULBS.

MESSRS. YOUELL have much pleasure in announcing that they have just received their importation of the above direct from Haarlem, the Bulbs being remarkably large and sound. For particulars see their advertisement in the *Gardeners' Chronicle* of 27th August.

Catalogues may be had on application.

Great Yarmouth Nursery, Sept. 1st, 1842.

CARNATIONS AND PICOTEES.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

YOUELL & CO.'s Superb Collection of the above will be found to contain every attainable variety worthy of cultivation; and having spared no expense in rendering their Collection the most extensive and select in the kingdom, they beg to announce that they purpose commencing to execute orders the first week in October, upon the following terms:—

	£	s.	d.
25 pairs of extra fine first-rate Show flowers,	5	0	0
12 ,, do. do. do.	2	10	0
25 ,, of fine Show flowers, . .	3	0	0
12 ,, do. do. . . .	1	10	0
25 ,, of extra fine Show Pinks, . .	1	4	0
12 ,, do. do. . . .	0	12	0

The selection being left to Y. & Co.

They beg further to state that, having a peculiar mode of packing the above plants, so as to insure their safe delivery in any part of the United Kingdom per Post, for the information of parties at a distance, wishing to avoid the expense of Carriage, Package, &c., they will send them free of postage, at the extra charge of 2*s.* per doz. pair.

A Post-office order, or reference, is respectfully requested from unknown correspondents.

Catalogues may be had on application, by enclosing two postage stamps.

NEW SUPERB FUCHSIAS.

Youell & Co. beg respectfully to state, that they continue sending out, per Post (free), their Superb Collection of Fuchsias, at the rate of 21*s.* per doz.

Great Yarmouth Nursery, Sept. 8, 1842.

MICHAEL BREWER, Nursery, London Road, Cambridge, begs respectfully to call the attention of the Nobility, Gentry, and the Public to that invaluable new Strawberry, the Emperor. It is a strong grower, a great bearer, and has a fine flavour, with large scarlet fruit superior to Keen's Seedling, with the great advantage of being ripe a fortnight earlier.

Fine strong plants are now ready at 30*s.* per 100.

ROSES.

MESSRS. PAUL and SON, CHESHUNT, HERTS, beg to inform Rose Amateurs and the Public in general, that they have just published a New Catalogue of Roses, 24 pages octavo, and which will be forwarded upon application, inclosing four Postage Stamps, post free.

Their Stock of Roses is this season unusually large and fine, and has received an addition of many new and beautiful varieties, and they trust that the moderate rate of charges will induce Rose Cultivators to favour them with their commands, which they pledge themselves shall be executed in the best possible manner. The Autumn Collection is now in full bloom.—A remittance, or reference, respectfully solicited from unknown Correspondents.

All Packages delivered free of carriage in London.

Cheshunt, Sept. 7th, 1842.

MAJOR'S BRIDEGROOM PANSY.

H. MAJOR, Knosthorpe, near Leeds, begs to announce that he will be able to send out Healthy Plants of the above beautiful Pansy about the middle of September, at 5*s.* 6*d.* each. H. M. has no hesitation in pronouncing it one of the best Pansies out; it is a large and well-formed flower, of good substance, and of well-defined colours. The centre is pure white, with large mulberry eye; the upper petals present a clean bright purple; the lower petals are deeply belted with rich violet; and the flower has the valuable property of retaining its colours till it begins to decline. The Editor of the *Gardeners' Chronicle* (No. 29) speaks thus of it. "H. Major.—The Pansy you intend to name Bridegroom is a desirable flower; the eye is bold, and the general form of the flower good; the inside is a good white, and the border round the under petals deep and rich."

Plants will be sent by Post free of expense. From unknown correspondents a remittance will be required with the order. A priced list of a few select Pansies may be had on Post-paid application.

September 5, 1842.

THOMAS BROWN begs to draw the attention of Amateurs and Florists to the following Rose-leaf seedling Pinks, three of which have had first-class Prizes awarded them at the Floricultural Society's Exhibition on the 21st June last, and also received first, second, third, and fourth prizes at the Slough open Show, June 24th:—

Eclipse, per pair, 7*s.* 6*d.* Model, per pair, 7*s.* 6*d.*
Garland, do., 7*s.* 6*d.* Acme, do., 7*s.* 6*d.*

With a choice selection of the most approved Show Flowers, also several superb new Pansies, and all the leading kinds in cultivation, strong and healthy plants of which are now ready for delivery.—Slough Nursery, Sept. 11, 1842.

TO GROWERS OF PANSIES.

JAMES MAY begs to inform his Patrons and Friends he has now ready fine Plants of every known first-rate variety, and will feel obliged by early orders. J. M. is sorry, in consequence of his late removal, and the very hot, dry season, he was not able to supply the very numerous orders he received; but hopes now to be able to supply any orders he may be favoured with. The following is a list of a few first-rate kinds, any of which may be had at 21*s.* per dozen, package included, viz.:—Peter Dick, Duke of Cornwall, Lord F. Egerton, Colonel Dundas, Jehu, Triumph, Diana Vernon, Glory of Knosthorpe, Jewess, Paul Pry, Eclipse, Miss Stainforth, Nicol Jarvie, delicata, Goldsmith, Souter Johnny, Van Amburgh, Launcelot, Amulet, Imogene, Sir William Wallace, Mrs. Long, Lady Glenallen, Sir J. R. Reid, Jenny Jones, Sophia, Admirable, Defender, Bianca, Commander, Laura superba, Alarm, majestica, Regulator, alba maculata, Advocate, Queen of the Whites (May's, *the best white known*), Haidee, Champion, Great Western, Mulberry Perfection, &c., &c., &c.

J. M. begs to inform the Public that his Collection of Pansies consists of more than 600 named varieties, many of which may be had at 6*s.*, 9*s.*, to 12*s.* per dozen. Extra fine Pansy Seed, all warranted, collected from the best varieties, which can be sent by Post, free, at 2*s.* 6*d.*, 5*s.*, to 10*s.* per packet.

A remittance respectfully requested from unknown correspondents; if by Post-office order, please to draw upon the Edmonton Post-office, or General Post-office, London.

Pansy Nursery, Tottenham, near London.

ALEX. PONTEY begs to call the attention of the Public to the following splendid SEEDLING PELARGONIUMS, which will be sent out this autumn at the prices named under. The COUNTESS OF MORLEY won the Gold Medal at the Royal Devon and Cornwall Horticultural Society's Show at Devonport in 1841, under the name of Beauty's Pride.

The usual allowance to the trade.	£	s.	d.
Wood's Countess of Morley . .	3	3	0
" Royal Pet	2	2	0
" Eros	1	11	6
" Macbeth	1	11	6

Tropæolum tricolorum and brachazerus, 18*s.* per dozen.

The first four are recommended as first-rate and superb show flowers.—Plymouth, August 24, 1842.

JOHN HOLLAND, Florist, Market-place, Middleton, near Manchester, begs to remind the readers of the *Chronicle* that his Superb Collection of Carnations and Picotees are now ready for sending out—including all the best varieties in cultivation; Catalogues of which are now ready, and may be had on prepaid application.

Market-place, Middleton, September 15th, 1842.

CARNATIONS, PICOTEES, AND PINKS.

J. T. WILLMER and SON, King's Road, Chelsea, by appointment Florists to her Majesty, beg to inform the admirers of the above-named Flowers, that their Plants are now ready for delivery at the under-mentioned prices, the selection being left to W. and S.:—

	£	s.	d.
25 pairs superior Show Carnations or Picotees . .	4	0	0
12 do. do. do. . .	2	0	0
25 do. do. Pinks	1	1	0
12 do. do. do.	0	10	6

W. and S. beg to state that for health and strength their Plants stand unrivalled.

N.B.—A reference in London, or payment in advance, is respectfully requested from unknown correspondents.

King's Road, Chelsea, Sept. 14, 1842.

THE MOST SUPERB DARK CHINA ROSE EVER OFFERED TO PUBLIC NOTICE—"MIELLEY'S PRINCE OF WALES."

WM. WOOD & SON have the honour to announce to their Friends and Amateurs in general, that they have purchased the entire stock of the above most magnificent Rose, and intend sending it out early in November, price for Dwarf Plants (on their roots) 10*s.* 6*d.* each.

The colour is of the deepest rich dark velvety purple violet, most perfect shape, beautifully cupped, large and very double, producing its elegant flowers on very strong footstalks; the habit is luxuriant and pleasing, with fine glossy foliage; it is perfectly hardy, and may certainly be depended upon as a Show Rose of first-rate excellence.

A discount of one-third will be allowed to the trade if 6 plants or more are taken at once. Early orders are respectfully solicited, which will be executed in rotation as received.

A remittance or reference will be required from unknown correspondents.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

TWITCHETT'S DON JOHN CARNATION (the finest Scarlet Bizarre in England); HEADLY'S SARAH, a splendid light-edged Red Picotee—each One Guinea per pair. See Wakeling's "Florist's Guide" for Sept. 1841 and June 1842. Also TWITCHETT'S FAIR ROSAMOND, a rich rose-edged Picotee on a snow-white ground, 10*s.* 6*d.* per pair. The Trade allowance if six pairs be ordered. Address Mr. Twitchett, Cambridge, or Messrs. Dickson, Florists, Acre-lane, Brixton, London.

Mr. Twitchett will show 21 blooms of his Don John against the like number of Martin's Splendid, or any other Scarlet Bizarre, for Two Guineas each bloom, and Twenty Guineas the odds, July 1843, p. p.

SPLENDID ERICAS (HEATHS), EPACRIS, BORONIAS, &c., &c.—J. and J. FAIRBAIRN, in gratefully acknowledging the kind and very liberal patronage they have been favoured with, beg leave most respectfully to solicit the attention and inspection of their friends and the public to their very large and exceedingly healthy Stock of the above highly beautiful tribe of PLANTS, which they flatter themselves are not to be surpassed in the kingdom; and which, from the extent of their stock, they are enabled to offer upon the following very advantageous terms:—

	£	s.
100 fine flowering plants, including 75 Ericas, 20 Epacris, and 5 Boronias. The baskets and packages of the Ericas will consist of the most popular and esteemed kinds—Ampullacea, Ampullacea rubra and elegans, Tricolor, Tricolor superba and elegans, Eximia, Hartnelli, Ventricosa, Ventricosa superba, Globosa, Stricta, and Purpurea, Depressa, Vernix ovata, Westcottia, Willmoreana, Vestita, Hyemalis, Formosa, Mirabilis, Pattersoniana, Picta, Sulphurea, Viridiflora, Intermedia, Mammosa, Linnæana superba, Linnæana curvæflora, Humeana, Banksiana, Sanguinea, Daphnoides, Blanda, Jasminiflora alba, Donnei, Cliffordiana, Rubra, Cerinthoides, Cerinthoides magna, Grandinosa, Verticillata nova, Persoluta rubra, Boweana, Exsurgens coccinea, Echiiflora, Cruenta, Sulphurea, Blandfordia, Trossula, &c., &c., &c. The Epacris will contain Impressa, Impressa pallida, Campanulata alba and rubra, Variabilis, Nivalis, Onosmæflora major, Pulchella, Grandiflora, Pungens, and Purpurascens, &c. &c. for	7	10
75 Fine Flowering Plants from the same Choice Selection,	6	10
50 do. do. do.	5	0
25 do. do. do.	3	0

For the convenience of those Cultivators who are only desirous to add a few gems to their collection, J. and J. F. beg to offer the following very choice and rare Ericas, [illegible] plants, package included, for 3*l.*: Aristata, Massoni, Gemmifera, Macknabbiana, Inflata, Shannoniana, Tricolor, two beautiful new Varieties, Elegans, Cavendishii, Ampullacea vittata, and Ampullacea. No. 1, a beautiful new Hybrid variety.

J. and J. F. beg to acquaint their Friends and the Public, that their collections of Fuchsias and Verbenas contain all the best varieties in cultivation, and that, having large stocks, they are enabled to offer them at very moderate prices.

J. and J. F. beg leave also to inform their Friends and the Public, that their stock of Fruit-trees, Standard and Dwarf, Trained and Untrained (of the most genuine kinds), Evergreen and Flowering Shrubs, American Plants, Standard and Dwarf Roses, are particularly fine this season, and very extensive. Early demands will receive their prompt and most careful attention, and be much esteemed.

All Orders they may be favoured with packed upon the most approved principles, and delivered free of charge in London.

N.B.—A remittance or reference required from unknown correspondents.—Nurseries, Clapham, near London, Sept. 15, 1842.

FUCHSIA ST. CLARE.

THE above magnificent FUCHSIA was raised by Mr. Meehan, Gardener to Col. Harcourt, at St. Clare, Isle of Wight, from whom Messrs. Youell obtained the entire stock. In May last it was submitted to Dr. Lindley for his opinion, which will be found in the *Gardeners' Chronicle* of the 14th of that month as follows:—

"Your Seedling Fuchsia is by far the finest hybrid we have seen; the flower being three inches in length, with the tube and sepals of a bright carmine colour, and the petals of a rosy purple. If, as you say, it is a strong grower and a free bloomer, it will prove a valuable addition to this beautiful genus."

Messrs. Youell, in bringing this beautiful production into public notice, do so without the slightest diffidence, being fully assured of its giving the most entire satisfaction. It is of vigorous habit, fine foliage, and, as a proof of its being a most profuse bloomer, they have a plant in flower at the present time on one branch of which there are upwards of 200 blooms, forming a splendid object for the Greenhouse, Conservatory, or Flower-garden.

Youell & Co. purpose sending it out in the second week of April next, at 10*s.* 6*d.* per plant, free of postage, to any part of the United Kingdom; and all orders they may be favoured with will be executed in rotation.

Orders from the Continent will receive every care in packing, so as to ensure their safety.

The usual discount to the Trade, where not less than 6 plants are ordered.—Great Yarmouth Nursery, Sept. 15, 1842.

PELARGONIUM—LYNE'S SUNRISE.—This valuable and first-rate variety, which has far surpassed "Rising Sun," or any flower of the kind ever produced, can be ordered of *Mr. Wm. Rendle, Union-road Nursery, Plymouth*: or of his London Agents—Messrs. Warner, Seedsmen, Cornhill, and Mr. Wm. Bristow, Seedsman, Knightsbridge, from whom Engravings and Descriptions can be obtained. The Stock being very limited, it is desired that orders will be immediately forwarded, as Mr. Rendle will not guarantee to supply strong Plants without this is attended to. Lyne's Duke of Cornwall, which is styled by the Editor of the *Chronicle* as "*a Flower of extraordinary brilliancy of colour*," with Lyne's Lord Ebrington, Lyne's Princess Royal, Cynthia, Hamlet, and Basset's Glory of the West, can also be obtained on application as above.

Union-road Nursery, Plymouth, Sept. 10, 1842.

FLORIST'S FLOWERS.

J. and W. FINLAYSON, Florists, Seedhills, Paisley, have at present for sale an extensive Collection of Auriculas, Tulips, Ranunculuses, Pinks, Carnations, Picotees, Pansies, &c. The principal part of the Ranunculuses are Scotch flowers, mostly of J. and W. F.'s own raising, and are of a very superior description. Also a few hundred fine plants of Double White Rocket.

Catalogues with particulars may be had on application, post paid. A remittance or reference will be required from unknown correspondents.—Sept. 17, 1842.

ROSES.

H. LANE & SON beg to announce that their Select Annual Descriptive CATALOGUE will be ready for delivery in a few days, and may be had, post-free, on application (enclosing a Twopenny Stamp), at the Nurseries, Great Berkhampsted, Herts.

HEARTSEASE.—The following SEEDLINGS having been carefully selected by H. LANE AND SON from their Stock, are now ready for sending out for the first time, and can be strongly recommended, viz., SIR JOHN SEBRIGHT*, 7*s.* 6*d.*; ALPHA*, 7*s.* 6*d.*; CHRISTINA, 5*s.*; VULCAN, 5*s.*; VENUS, 5*s.*; DIANA, 5*s.*; NERO, 3*s.* 6*d.*; ACTEON, 3*s.* 6*d.*; JOHN FOWLER, 3*s.* 6*d.*; SIGNOR LABLACHE, 3*s.* 6*d.*, and CALYPSO, 3*s.* 6*d.* if ordered singly; but if the whole are taken they will be charged only 45*s.*

Those marked * were awarded Prizes at the Floricultural Society of London's Show, on the 21st of June last.

PELARGONIUMS.

THOSE SPLENDID SEEDLINGS raised by Mr. JOHN WILSON, which during the present season have been the subjects of universal admiration, and for which prizes have been awarded at the various London Exhibitions, will shortly be ready for delivery; and Catalogues of them may now be had *gratis* on application to the Proprietor, J. Pamplin, Nurseryman, Walthamstow.

TO PANSY GROWERS.—In answer to the numerous inquiries J. PEARSON has received, requesting to know when his SEEDLINGS will be let out, he begs to say he has Plants of all except "Milton," and will send them at 15*s.* each on receipt of a Post-office order. BLACK PRINCE, 7*s.* 6*d.*

The usual allowance to the Trade.—Chilwell Nurseries, near Nottingham.

LISIANTHUS RUSSELLIANUS.

J. CUTHILL begs to inform the Trade that he has strong, dwarf, bushy Plants for next year's flowering now ready, at from 24*s.* to 30*s.* per doz. J. C. will have Seed of the above in October; also his Black Spine and Snow's Cucumber Seeds, with his early Melon, &c.—J. Cuthill, Florist, Denmark-hill, Camberwell, London.

THE FINEST VARIETIES OF HYACINTHS, IRISES, AND ANEMONES, AT VERY MODERATE PRICES.

JOHN SUTTON and SONS, importing largely of Irises, Hyacinths, Anemones, Tulips, &c., which are selected annually while in bloom in Holland, are enabled to supply such sorts as are most worthy of cultivation, and at very low prices. The following are particularly recommended:—

The finest Hyacinths known, per dozen	£0	15	0
Very fine ditto, per dozen	0	7	6
Ditto ditto Mixed Double, per 100	1	1	0
Superb New Irises, best 30 varieties by name	1	1	0
Ditto ditto ditto Mixed, per 100	1	5	0
The New Large Double Anemones, by name, per 100	3	10	0
The same Varieties, mixed, per 100	1	1	0
Early Single, many colours, per 100	0	7	0

Gladiolus, Ranunculus, Ixias, Tulips, Crocuses, Jonquils, Narcissus, &c., &c., in extensive collections, at low prices, as per Catalogue. N.B.—Goods delivered, free of carriage, to the Railway Stations and Coach Offices in London.

Reading Nursery, Sept. 15.

TO MARKET GARDENERS, NURSERYMEN, AND OTHERS.

PROTHEROE and MORRIS are instructed by the Trustees of Messrs. ADAMSON and SON, of Stoke Newington, to submit to public competition, on the premises, Wells-street, Hackney, on Monday, Oct. 3, 1842, at 11 o'clock precisely, the whole of the VALUABLE STOCK, consisting of about 800 Hand-glasses, 70 Three-light Boxes and Lights, the whole of which are in excellent condition, Horses and Cart, a quantity of fine Rhubarb for forcing, and sundry Utensils. May be viewed two days prior to Sale. Catalogues may be had on the premises, of the principal Seedsmen, aad of the Auctioneers, American Nursery, Leytonstone.

TO NURSERYMEN, PINE-GROWERS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS are instructed by the Trustees of Messrs. Adamson and Son, Stoke Newington Common, to submit to public competition on the premises, on Monday, Sept. 19th, 1842, and following days, at 11 o'clock, the whole of their celebrated Stock of Pine Plants, Greenhouses, Hothouses, Graperies, Carts, Waggons, and general Farming and Agricultural Implements, and a considerable quantity of Building Materials. The whole comprises about 35,000 feet of Glass, with Brick and Ironwork and Water Apparatus complete; about 6,000 Pine plants of the first quality, and well-known established Stock; a considerable number of Cucumber, Melon, and other Frames and Lights; the stock of Greenhouse and other Plants, Garden Pots, &c.

May be viewed a week prior to Sale. Catalogues may be had of the principal Seedsmen, on the premises, and of the Auctioneers, American Nursery, Leytonstone.

The whole of their valuable Nursery and other Stock will be disposed of by public Auction about the third week in October next, of which timely notice and particulars will be given.

BELGRAVE NURSERY.

MESSRS. PROTHEROE & MORRIS are instructed by Mr. J. ROGERS, to offer to Public Auction, on MONDAY the 26th Sept. 1842, and following days, on the Premises, Eaton-square, Pimlico, in consequence of the lease having expired—The Glass and Erections of several Greenhouses and Pits, Brickwork, about 300 feet of 6-inch Waterpipe, a quantity of Flints suitable for Rockwork, and a large quantity of York Paving: also the whole of the Nursery Stock, consisting of fine large bearing Standard Mulberries, Almonds, Acacias, Limes, Poplars, Bignonias, Catalpa, Lilac, Cytisus, Laburnum, fine Hollies, Laurels, Privets, Box, Roses, Laurustinus, Aucubas, Bays, Scarlet and White Rhododendrons, Cedars of Lebanon, Evergreen Oaks, Arbor-vitæ, Cypress, Daphnes, Jasmines, a large quantity of Ivy in pots from 3 to 8 feet, Large Privet Hedges, Box Edging, Thrift, &c.; Pinks, Carnations, Herbaceous Plants, &c. &c.

May be viewed a week prior to the Sale.—Catalogues to be had on the premises, of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respectfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths, may be seen in use at his house upon application to the gardener.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

HEATING BY HOT WATER.

JOHN WALKER, 46, St. John's Square, Clerkenwell, London, having been for many years extensively engaged in Warming Churches, Manufactories, Hospitals, Hothouses, Conservatories, and Private Houses, by means of Hot Water, either in Pipes or Pedestals, can confidently recommend this mode of heating in preference to any other. Numerous references can be given both in town and country, where he has successfully and satisfactorily applied it. Baths fitted up and heated in a superior manner. Orders executed in all parts of the Country with punctuality and despatch.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their Manufactory.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are complete without furnaces or setting in brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 5*l.* 5*s.* and upwards. Further particulars, with plans and estimates for heating any description of building, may be obtained as above; where also may be seen the improved Wrought-iron Boiler, as applied with Chanter's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats, Iron Fencing, Hurdles, Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes.

N.B.—WAYTE's New Patent Land-pressers and Drills.

THE GARDENER AND PRACTICAL FLORIST, No. III., contains—Properties of Flowers and Plants, No. 3; Properties of the Geranium; Botanical Fallacies; Culture of the Auricula; Progress of Improvement in Florist's Flowers; Violets; The Suburban Horticulturist; The Management of Plants in Dwelling-houses; Extracts from the Note-Book of a Practical Gardener.

*** THE GARDENER *is published weekly, price* 3*d.*, *and in monthly parts, price* 1*s.*; the First of which will appear with the Magazines.

London: R. Groombridge, Paternoster-row; where all Advertisements and communications must be sent free. May be had or ordered of all Booksellers.

WEST ON HEDGE-ROW TIMBER.

Published this day, 8vo, pp. 136, 6*s.* Boards,

REMARKS on the MANAGEMENT, or rather the *MIS*-MANAGEMENT of WOODS, PLANTATIONS, and HEDGE-ROW TIMBER. By J. WEST, Land Agent, &c. North Collingham, Newark, Notts.

"The subject of which this volume treats is a very extensive and a very important one. Although there are many persons possessed of wide estates who are fully sensible of the importance of careful and systematic management in the growth of timber, yet, altogether, it is a matter which has been more neglected and left to chance as to its results, than almost any other in the wide range of rural affairs. Mr. West severely censures this too general negligence on so important a subject, shows clearly in what the mismanagement consists, and points out the more proper modes of proceeding. His work is one of value, and ought to be widely known."—ARGUS, Sept. 10, 1842.

London: Longman, Brown, Green, and Longmans.

Just published, price 6*s.* cloth,

THE HAND-BOOK OF CHEMISTRY; with a complete Index of Reference. By G. H. CAUNTER, Esq.

London: W. S. Orr & Co.; and W. & R. Chambers, Edinburgh.

In one small volume, price 15*s.*

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopædias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, a Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur and Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

London: J. Andrews, Bond-street; Orr and Co., Paternoster-row.

WANTS a SITUATION as GARDENER, a middle-aged married man, who has had extensive practice in every branch of his business. The most satisfactory references can be had from the place he is now about to leave. Letters addressed to T. Harrison, Nursery and Seedsman, York, will have immediate attention.

WANTS a SITUATION as GARDENER, William Stevenson, 33 years of age; has had 13 years' practical experience in first-rate situations, including Oxenford Castle, Howkston, Stowe, &c. &c. For character, he refers Noblemen and Gentlemen to Mr. Ferguson, Stowe, Buckingham. Letters addressed to W. S., Aylesbury Nursery, Bucks, will be immediately attended to.

WANTED by a Young Man, aged 21, who has a slight knowledge of Gardening, a situation under a GARDENER, for improvement. 10*l.* will be given as a premium. Address, prepaid, James Turner, Stillingfleet, near York.

Just published, in 2 vols. 8vo. cloth, price 24*s.*

HISTORICAL MEMOIRS of the QUEENS of ENGLAND. By HANNAH LAWRANCE.

"These laborious and interesting memoirs."—*Athenæum.*

"This very industrious and interesting work."—*Examiner.*

"One of the most pleasing and valuable contributions which English history has received for many years."—*British Mag.*

TO FLORISTS.—SELECT PLANTS FOR SALE. A BARGAIN.—TO BE SOLD, a few Camellias, Azaleas, Orange-trees, Hedychium speciosum, Strelitzia reginæ, &c., mostly in high condition; the Property of a Gentleman who wishes to reduce his Stock. They are in a Garden adjoining a Railway, rather more than an hour's ride from Town, and will be sold a bargain. For Particulars apply to Messrs. Tyerman and Gardiner, 6, Chancery-lane, London.

WANTED to purchase Second-Hand, but in good preservation, a small GREENHOUSE, sufficiently near Greenwich to be conveyed there without much additional expense. Letters post free, addressed to A. Z., Post-Office, Blackheath, Kent, will receive early attention.

MECHI'S superb TEA TRAYS, in Papier Maché (Manufactory, 4, Leadenhall-street, London), are unrivalled specimens of Japan work, infinitely surpassing the Chinese. The prices vary from a very low figure up to twenty guineas the set. They comprise some brilliant specimens of art in figures, landscapes, flowers, and birds, with buhl and gold. The same manufacture is applied in work boxes, dressing cases, envelope cases, netting boxes, glove boxes, playing card boxes, and ladies' visiting card cases, hand screens, pole screens, card racks, inkstands, ladies' work tables, chess tables, portfolios, note and cake baskets, ladies' desks, letter boxes, &c. The foregoing are all in Papier Maché, and very cheap, say from 13*s.* up to 20*l.*; and Mechi can confidently assert that his establishment for these articles surpasses in price, quality, and extent of stock, any similar concern in the United Kingdom. Mechi is sole inventor of the Mechian dressing cases, the patent castellated tooth brushes, 9*d.* each, the cushioned bagatelle tables, the magic razor strop, and peculiar steel razor. A visit to his establishment will gratify those who are desirous of seeing the most perfect manufactures of this country displayed in the most attractive form.

SHIPS FOR NEW ZEALAND, under Charter to the New Zealand Company, to sail as under mentioned, viz.—

FOR NELSON AND WELLINGTON:

INDUS, A 1, 425 tons, from London, 1st October.

For further particulars apply at the New Zealand House, Broad-street Buildings.

EMIGRATION to NEW ZEALAND. IMPORTANT TO FARMERS AND SMALL CAPITALISTS.

THE COURT of DIRECTORS of the NEW ZEALAND COMPANY having received numerous applications for passages from persons of the above description, and being desirous of facilitating the emigration to New Zealand of persons of the Labouring Class, of good character, but who do not fall within the regulations entitling them to a Free Passage; and also of Small Capitalists, to whom the costly accommodation usually provided for Cabin Passengers would be unsuitable: Notice is hereby given that Cabin Passages to Wellington and Nelson may be obtained in a First-class Ship chartered by the Company, to sail from the port of London positively on the 15th of NOVEMBER NEXT, on the following terms:—

The price of a Chief Cabin passage, with a liberal dietary, will be Fifty Guineas for a married couple, and Thirty Guineas for a single adult person; and that of a Fore Cabin passage will be Twenty Pounds per adult. The prices for children will be in the proportions fixed by the Passengers' Act, or as the Directors may fix, in the case of large families.

Families who may desire it, may have extra space for their accommodation, upon payment of a proportionate additional sum. One ton freight will be allowed to Chief Cabin, and half a ton to Fore Cabin Passengers, free of charge; extra freight will be allowed by the Directors in their discretion, at the rate of 45*s.* per ton measurement, and 25*s.* per ton dead weight.

The Company will appoint an experienced Surgeon, and will provide medicines and medical comforts.

Applications for Passage or Freight to be addressed to the Secretary of the New Zealand Company, Broad-street Buildings, London, on or before Saturday, the 15th of October next.

A Deposit of 10*l.* will be required for every Chief Cabin Passage, and of 5*l.* for every Fore Cabin Passage, which must be paid to the Company on or before the 15th of October, and the remainder of the Passage Moneys previously to embarkation.

By order of the Court, JOHN WARD, Secretary.

New Zealand House, Broad-street Buildings,
14th September, 1842.

HODGSON and ABBOTT'S PALE ALE.—The above celebrated Beer, so strongly recommended by the Faculty, is to be procured only from E. ABBOTT, Brewery, Bow, Middlesex. The Trade not being supplied, the Pale Ale cannot be genuine if procured elsewhere.

City Office, 98, Gracechurch-street.

WHITE TEETH. ROWLAND'S ODONTO, or PEARL DENTIFRICE.—This is an efficient White Powder for the Teeth, solely prepared from Oriental Herbs of the most delightful odour, and of sovereign virtue for strengthening, preserving, and thoroughly cleansing the Teeth. It eradicates tartar from the Teeth, removes spots of incipient decay, polishes and preserves the enamel, to which it gives a pearl-like whiteness; and, above all, from its disinfecting properties, gives sweetness to the breath. As an antiscorbutic, the gums also share in its transcendant powers. Scurvy is eradicated from them, and a healthy action and redness are induced, that offer to the notice of the medical practitioner the most indubitable signs of their healthful state. Price 2s. 9d. per box, duty included. *** NOTICE—The Name and Address of the Proprietors, A. ROWLAND AND SON, 20, Hatton Garden, London, are engraved on the Government stamp which is pasted on each.

*** Be sure to ask for "ROWLAND'S."

COUNTRY SHOWS.—Sept. 20, Elham. 21, Nottingham, Faversham, Thornbury. 23, Norwich. 24, Wexford. 26, Newcastle. 27, Tamworth.

OUR attention was lately called by a correspondent to the curious fact that Sir W. Pepys' garden at Tandridge, in Surrey, in a sandy soil, is in the most luxuriant beauty, though it has not received, this hot and dry weather, one drop of water but what has fallen from the heavens. Upon inquiry, we learn from Mr. Clark, the intelligent gardener at Tandridge Court, that the present site of the flower-garden there was some eight years since partly pond, and partly a sandy bank. The former was filled up with earth near at hand; the latter was removed to the depth of three feet. A compost prepared of sandy loam, decayed vegetable mould, silver sand, and lime, well mixed and seasoned, was substituted, to the depth of three feet. It is perfectly true, that in this place, during the late dry season, not even a partial thunder-shower having occurred, there has been no occasion to water anything, except the tall sorts of Lobelias and Fuchsias. Mr. Clark finds, from long experience, that if pains are taken at first to prepare a good soil to the depth of about three feet, it retains its moisture, and plants flourish in it much better than if watered artificially.

In this opinion we concur. In fact, it is so much illustrated by a paragraph in the "Theory of Horticulture," that we take the liberty of quoting the passage entire.

"It is doubtful whether, in the open air, watering is not often more productive of disadvantage than of real service to plants. When plants are watered naturally, the whole air is saturated with humidity at the same time as the soil is penetrated by the rain; and in this case the aqueous particles mingled with the earth are very gradually introduced into the circulating system; for the moisture of the air prevents a rapid perspiration. Not so when plants in the open air are artificially watered. This operation is usually performed in hot dry weather, and must necessarily be very limited in its effects; it can have little if any influence upon the atmosphere. Then, the parched air robs the leaves rapidly of their moisture, so long as the latter is abundant: the roots are suddenly and violently excited; and after a short time the exciting cause is suddenly withdrawn by the momentary supply of water being cut off by evaporation, and by filtration through the bibulous substances of which soil usually consists. Then, again, the rapid evaporation from the soil in dry weather has the effect of lowering the temperature of the earth; and this has been before shown to be injurious. Such a lowering, from such a cause, does not take place when plants are refreshed by showers, because at that time the dampness of the air prevents evaporation from the soil, just as it prevents perspiration from the leaves. Moreover, in stiff soils, the dashing of water upon the surface has, after a little while, the effect of puddling the ground, and rendering it impervious, so that the descent of water to the roots is impeded, whether it is communicated artificially, or by the fall of rain. It is, therefore, doubtful whether artificial watering of plants in the open air is advantageous, unless in particular cases; and most assuredly, if it is done at all, it ought to be much more copious than usual."—*Theory of Horticulture*, p. 125.

IN the chronicles of the Queen's visit to Scotland, it is recorded that, at Taymouth Castle, HER MAJESTY "planted two trees in the park on the eastern side of the Castle—an Oak and a Scotch Fir. Her Majesty handled an elegant mahogany spade, made expressly for the occasion, *with the skill of an experienced gardener.*" We trust that our fair friends will thus be fortified in their Horticultural resolves, and indeed become good gardeners, now that so illustrious an example has been set them. Horticulture, too, will more than ever claim the dignity of an honourable profession, when it is known that the Queen of England has condescended to labour at the art with her own Royal hands.

NOTHING can more plainly show how much were wanted the observations we have lately made on weeds than the many complaints that have been addressed to us by gardeners on the one hand, and their employers on the other; the first remonstrating, angrily enough sometimes, for what they call our showing them up; the second, urging us to continue our observations upon the same subject, because of the negligence of their gardeners, as regards the neatness of their premises. From these we last week selected for publication one only, signed "A Gardener." The writer of this letter appears to be a sensible person, and we like his tone; and therefore it is that we gave him a place.

He says, that in many cases a gardener *cannot* keep his weeds in check, because he is badly provided with labourers; and that, therefore, it is unfair to throw upon the gardener the unneatness which is really owing to the parsimony of his master. No doubt this *may* be the case, and *sometimes* is: but our experience tells us, that neatness depends more upon foresight and method, and a continual attention to it everywhere, than upon the amount of means that a gardener has at his disposal. We repeat it, that the destruction of annual weeds is a cheap and easy process, provided they are constantly looked after; and that, once effected, scarcely any labour worth talking of is required afterwards. This too, we will add, that some of the worst-kept places we have ever seen were where the allowance of labour was most ample. The whole secret lies in *never allowing such weeds to* FLOWER *upon any part of the premises.*

With regard to our leaning more to masters than their men, that we must beg to deny. We lean to neither the one nor the other, but we hold a steady balance in which each may be placed. It is true that we have always set our faces against that insane, and, let us add, disgraceful abuse of their superiors, which some gardeners indulge in, and which, in an anonymous form, has been allowed to find its way into certain gardening publications It is also true that we have never permitted one-sided statements in favour of gardeners to find their way into our columns, nor have we been malicious enough to raise their expectations of improving their condition by delusive representations that can never be realised. But, on the other hand, we lose no opportunity of rendering them services in a practical manner; and they may be assured, that to point out their errors—to persuade the respectable part of them to set their faces against those who are not so —to induce them so to act as to be raised in the eyes of their employers, are far more efficient means of bettering their condition than joining in an idle and often very unjust cry against their masters.

There are people in the world who think a great deal of the rights of servants, and very little of the rights of those who pay and feed them; and who, if the good sense of gardeners did not prevent it, would soon put an end to gardening altogether, by disgusting the wealthy classes, by whom alone gardeners can be employed.

We trust that even the humblest of our readers will despise the evil counsels of these Horticultural Chartists, who, after leading their foolish followers into ruin, will be the first to turn round and disclaim their acts. Good conduct and a contented mind are among the most certain of all means on which a gardener can rely for permanent prosperity; while, on the contrary, a surly, grumbling, discontented fellow gains nothing whatever by such feelings, except dismissal from every place where he is employed, until there is nothing left for him but the workhouse.

No one can have the real welfare of gardeners more sincerely at heart than we have; few persons, we believe, possess the same means of rendering them services; and we are at all times ready to assist those who really deserve it. We know how highly estimable a body of men they constitute, and we lament to see how ill they are often remunerated for their valuable labours; but we also know that there are many ignorant, dishonest, ill-conditioned men among them, and that it is to these that the low station occupied by gardeners is mainly owing. It is doubtless true that many mean, exacting masters are to be met with, and that some mischief is done to gardeners by the bad example such persons set to their neighbours; but they are the exception, and not the rule. Infinitely more injury to the profession arises from the conduct of idle, slovenly, sotting, ignorant gardeners; for they so lower the standard of their class, as to extinguish that kind and generous consideration for his dependants which is one of the noblest attributes of the English country gentleman.

HUMUS AND HUMIC ACID.

THERE is, perhaps, no subject connected with the nutrition of plants which has led to more discussion than the substance called humus; as we have recently on several occasions spoken of humus and humic acid, perhaps a few remarks on the nature, origin, and properties of these substances may not be devoid of interest.

When a chemist analyses a soil, that is to say, when by varied and careful experiments he endeavours to ascertain the properties and constitution of the various matters which enter into its composition, he naturally is led to separate them into the inorganic and the organic; those which are purely of an earthy and indestructible nature, and those which result from the decay of plants or animal matters. Animal substances, for the most part, putrify or undergo decomposition rapidly, being resolved into carbonic acid, ammonia, and other gaseous matters; whilst the remains of vegetables decay slowly and in a very different manner. Animal matters are in time wholly dissipated and converted into gas; whilst vegetable substances undergo a similar change, but far more slowly and imperfectly; for, when the decay of a plant is complete, there generally remains a considerable bulk of solid dark-coloured matter, which, though it does not at all resemble any of the forms of organic matter we are acquainted with, yet may readily be proved to be of organic origin, as it is combustible, burning easily in the fire, forming carbonic acid and water, and leaving, perhaps, a small quantity of ash. When we remember the manner in which, year after year, the plants which grow on the land gather carbon from the air by their leaves, whilst they as constantly increase the quantity of organic matter in the soil, every season adding leaves and roots to it, which by decaying are gradually converted into the dark-coloured combustible substance just mentioned, it is plain that all soil must contain more or less organic matter mingled with the earthy ingredient of which it is principally composed.

Decaying substances of this description have been termed humus, and hence a barren sandy soil on which very few plants have grown is said to contain little humus, whilst well-cultivated garden soil which has been well manured and which abounds in decaying organic matters is said to be rich in humus. It is evident that the substances called humus must be somewhat variable in nature; in general the term has been applied to all the brown, decaying, organic matters found in the soil. It is nearly insoluble in water, only a small quantity dissolving in that fluid, and communicating to it a very pale straw yellow colour: when put into an alkaline solution, that is to say, into water containing caustic potash or soda, a brown solution is formed, far darker than is every obtained when merely water is employed. When humus is carefully dried and preserved in dry air, it may be kept a very long time without diminishing in quantity, or undergoing any perceptible change. In the same way, it may be kept under water for a long time, provided air be excluded; but when exposed to moist air, it soon begins to change, carbonic acid is formed, the humus diminishes in weight and at the same time becomes darker in colour. When heated in the air, humus inflames and readily burns with a pale flame, like rotten wood, which, in fact, consists principally of humus.

There are two modifications of humus which are formed from it under proper circumstances. The one is known under the name of mould, coal of humus, and humin; whilst the other is termed humic acid. The former is the dark-coloured substance produced by the gradual exposure of humus to the air; it is far less soluble in water or alkaline solutions than humus, and contains less hydrogen than that substance; hence, though like humus it is combustible, it burns with less flame, and in a manner more resembling charcoal. Humic acid is formed whenever caustic alkalies act on humus. It differs from humus in possessing feeble acid powers, that is to say, it combines with the alkalies and earths to form salts, which are slightly soluble in water, and in which the bases, though united to a very feeble acid, are united in different proportions, constituting, therefore, distinct salts, though very liable to be decomposed by more powerful acids. The dark colour of the solution formed by the action of alkaline salts on humus is due to the presence of a small quantity of humates, or compounds of humic acid; for whenever alkalies act on humus, a portion of humic acid is generated, which combines with the alkali to form a salt.

Having thus very briefly mentioned the three varieties of humus which can exist in the soil, a few words may be said respecting the probable office performed by them in the nutrition of plants, and the theories respecting them which have attracted the greatest attention. In the early part of this century, when attention was first paid to the organic matter always present in fertile soils, it was observed that, by the action of alkaline solutions on the soil, a quantity of dark-coloured organic matter could be dissolved. The substance thus extracted from the earth was called humic acid; its properties were partially investigated, and important effects in the nutrition of plants were attributed to its presence in the soil; the old theory of Priestley, Ingenhousz, and others, was, for the time, set aside, and in place of saying, as they did, that plants derived their carbon from the carbonic acid gas, or fixed air, in the atmosphere, it was stated that humic acid was the great source of carbon, that it was formed by the decay of organic matter, and rendered soluble by alkalies and other bases present in the soil. At that period the nature of manure was very imperfectly understood, and very crude and indefinite ideas were entertained respecting the use of humus, which was, however, supposed, in some way or other, to be the great source of carbon. Thanks to the labours of Liebig, we have now clearer views on the subject, and the doubts and difficulties of former years are removed. He has successfully disproved the humic acid theory, and re-established the old view of the source of carbon, namely, that plants obtain it by the decomposition of carbonic acid gas. The use of humus in a soil, according to his view, is not to furnish a supply of humic acid and humates when acted on by alkalies, but to provide carbonic acid by gradual oxidation or decay. Although he has clearly proved that plants do not derive their carbon from humic acid, or humus rendered soluble in water by the action of bases, yet it is very probable that humic acid is constantly being formed in the soil, and it may possibly effect other purposes, such as the formation of ammonia, and hence assist in the assimilation of nitrogen. In saying this, it is not meant for a moment to question the correctness of the present theory of the assimilation of carbon, but rather to show that although it is proved that the chief value of humus consists in its evolving carbonic acid whilst undergoing decay and passing into mould, it is not proved that it does not at the same time perform other functions in the nutrition of plants.—*E.*

ENTOMOLOGY.—No. XXXIV.

THE TURNIP SAW-FLY, named *Athalia spinarum*, is the parent of the Black-caterpillar, which is also called the Black-palmer, Black-canker, Black-jack, Black-slug, and Nigger, or Negro. Having found the flies last month in the chalk-pits of Kent, I felt persuaded that the Negro-caterpillars would make their appearance amongst the Turnip-crops this autumn or next spring; and my suspicions were but too well grounded, for I have received letters from Norfolk, Suffolk, and Surrey, informing me that these destroyers are at work. Although it may happen that the kitchen-garden seldom suffers from their attacks, yet, as every Turnip-field is liable to be devoured by them, it is advisable to call the attention of cultivators generally to this very important subject: I hope, therefore, that the following information will prove useful to every one who grows this invaluable vegetable, and I trust that it may elicit observations which may throw farther light upon their economy—for instance, their caprice in preferring English Turnips in some districts, whilst in others they have only fed upon the Swedes; some fields are regularly defoliated, whilst others are consumed in patches, whether the heavy rains have affected them, &c.

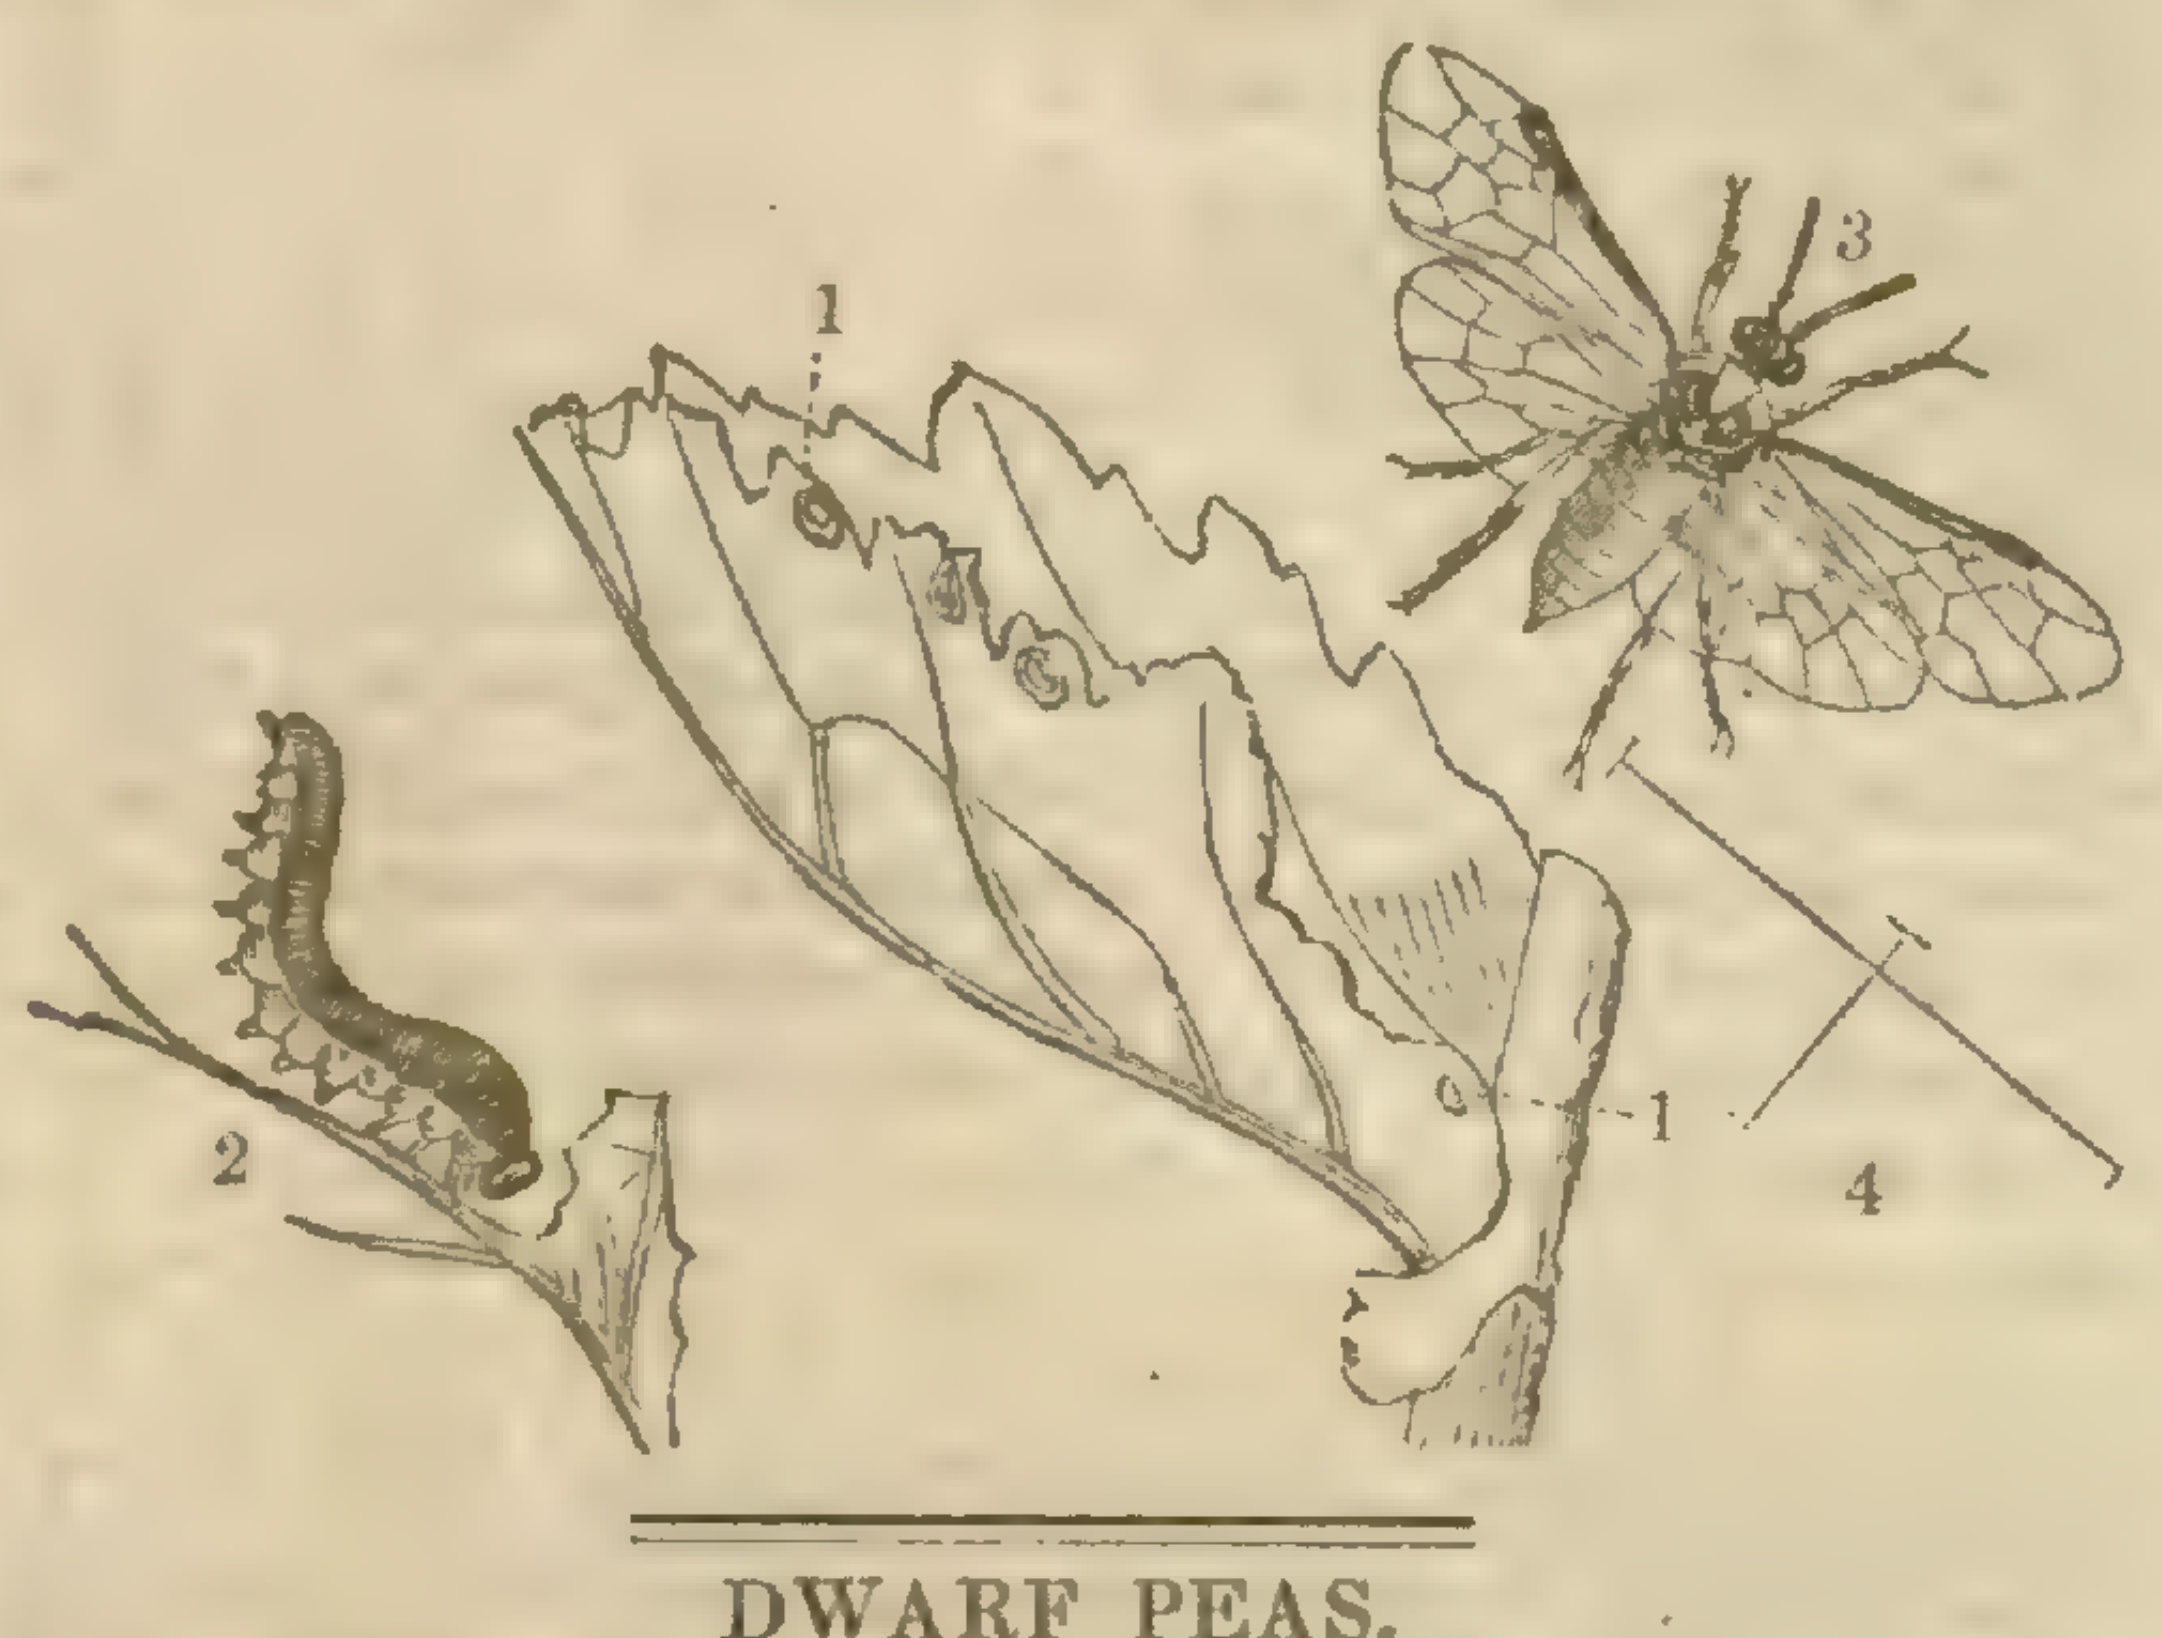
It is now well ascertained that by the proper management of ducks, and the use of sheep, any serious mischief from the Negroes may be averted. If ducks be not on the premises, they should be purchased, without delay, by the farmer who has detected the enemy on his Turnips; those from 3 to 5 weeks old are the most efficient for the purpose; for old ducks do not work well. If time will allow, they should have some of the Negroes with some barley offered to them when hungry, in order to bring them acquainted with the vermin they are to search for; the ducks, however, should be driven to the field as soon as possible, or if at a distance, they may be carried in a cart or waggon. They ought then to be divided into troops, consisting of not more than 100 each, under the superintendence of a boy or girl, who must precede the ducks with a long light hazel stick or willow rod, to brush the Negroes off the Turnip-leaves, as well as to drive the birds to water and to rest, 3 or 4 times a-day; after drinking, the ducks will often disgorge the Negroes in great quantities, and soon go to work again with whetted appetites; they must also be driven home at night and put into a barn, when they ought to be fed with a little barley or other grain, to keep them in health and vigour, otherwise so much living animal food disagrees with them and causes diarrhœa. Poultry, also, with the exception of turkeys, are found to answer well, especially where the Negroes are not very abundant.

The next best remedy sheep will supply; in Sussex and Suffolk these simple agents were resorted to with great success. It is advisable first to harrow the Turnips, and immediately after the sheep must be driven once or twice across the field, as close as possible, so that no part may escape, and the more numerous the flock the better: if this be repeated two or three days successively, no farther mischief will ensue from the Negroes. This desirable result is easily explained: for by harrowing or drawing a bushed hurdle over the Turnips, the Negroes are dislodged, and fall to the ground, and the sheep following, trample them to death. Those who cannot command either ducks or sheep in sufficient numbers, may effect essential service by hand-picking, although it is a tedious, and, perhaps, an expensive remedy. The best plan seems to be sending 10 or 12 children with pint pots into the field, under a superintendent; and as they fill the pots, they must be emptied into some large covered vessel conveniently placed, and containing some brine or lime-water to prevent the Negreos from crawling out when the cover is removed. It has been ascertained that a boy ten years old gathered 180 Negroes in an hour, in a field suffering only in a slight degree: at 8 hours per diem this would amount to nearly 1,500, which would give 9,000 a week; and thus 10 or 12 children might destroy 90 or 100,000 in the space of six days, even where the Negroes are *not* abundant.

Let it be remembered also that hoeing Turnips infested by the Negro-caterpillars is the most fatal of all operations to the crop; few of them are killed by the hoe, and as their food is thereby reduced possibly one half, the remainder more speedily, and with greater certainty, falls a sacrifice to their ravages; it also prepares the soil for the full-grown Negroes to bury themselves with greater ease, in order to undergo their transformations. As soon, however, as they have disappeared, the hoes may be set to work with great advantage, where the crop has been only partially injured, for then it will disturb and destroy multitudes of those which have entered the earth, and would produce the parents of successive broods of Saw-flies; and such would likewise be the best time to scatter lime dust or water, with salt or liquid manure.

As early as May, or sooner, the Saw-flies make their appearance; the female (fig. 3) lays her eggs on the under surface along the margin of the leaf (fig. 1); these hatch in about five days, and produce the Negroes, which are not thicker than a fine thread and white, but after changing their skins they become black, and eventually are three-quarters of an inch long (fig. 2), when they are more of a lead colour and yellowish white beneath, their skins being very much wrinkled; they erect their tails whilst feeding, and are stretched out at full length in repose, or lie sleeping coiled up on the leaf; they are feeding about three weeks, after which they descend to the ground and enter the earth, where they form a cocoon silvery inside, in which the larva eventually becomes a pupa. In summer they remain only three weeks in this quiescent state, but the autumnal ones lie buried through the winter. The remedies proposed are principally collected from an article in the 2d volume of the Journal of the Royal Agricultural Society, to which the reader is referred for a very full account of this enemy to the Turnip-crop; and coloured figures of the fly, with dissections, &c., will be found in Curtis's Brit. Ent., plate 617.—*Ruricola.*

In my last paper upon *Cladius difformis*, I fear that the larva figured is the young of some other Saw-fly, for I have since seen both sorts upon the same leaf, and I think the larva of the Cladius never curls itself up: the *description*, however, is quite correct in every other respect.



DWARF PEAS.

A correspondent having requested us to furnish him with a list of the best varieties of Dwarf Peas, we have obtained the following, in the hope that it will prove useful to many others:—

1. *Bishop's Dwarf.*—This variety grows about two feet high, and is well suited for the first sowing to stand the winter; but it is neither so early nor so abundant a bearer as the Early Frame; if sown at different periods it will furnish a good succession of early crops.

2. *Dwarf Brittany.*—This sort does not grow more than six or eight inches high, but is nevertheless an abundant bearer; it is about a week later than the preceding, and it will stand the winter; but it does best if sown early in spring.

3. *Spanish or Knox's Dwarf.*—This variety grows about two feet high, and comes into bearing about a week after the preceding. It is a tolerably good bearer, but is only fit for summer use; it should, therefore, be sown early in spring, as it is too tender to stand through the winter.

4. *Groom's superb Dwarf Blue.*—This is the best dwarf variety for summer use, and grows about one foot and a half or two feet high. It is a very abundant bearer, and possesses all the good qualities of the Blue Prussian. It is only fit for late sowing, and if sown at different times from March to June, it will furnish a succession without any other variety.

AMATEUR'S GARDEN.—No. XXXVIII.

PREPARATIONS must now be made for the protection of tender plants during the winter months, of which we are already reminded by the cold and chilly evening air. The enthusiastic amateur will probably find a difficulty in stowing away the numerous plants which have been raised from seeds or cuttings since the spring, and I will therefore describe to him some cheap and efficient pits, which I observed in a country nursery a few weeks ago. The walls are built of peat turf nicely cut from a common, much in the same manner as those which are used for burning, but of course considerably larger. In building, the walls should be made to slope outwards a little, and should be well filled in behind with solid earth; the inside can then be cut neatly with a sharp instrument, and a most excellent wall will thus be formed. If any of the readers of these papers have ever visited the Military College at Sandhurst, they will have observed the same thing done on a large scale, in the formation of the various batteries for exercising the students. After the walls have been built, all that is necessary is, to drive down some strong wooden posts along the back and front, on which the sill and rafters rest, as well as upon the turf wall. If at any time the turf sinks, these support the sill and the rafters, and by pushing in a little turf below the former, the vacancy will be filled up. Such pits will last for many years, and, when covered with good sashes, are dry, and much warmer than even those which are built of brick and mortar; and, the ground at the back and front being nearly level with the glass, the whole are very easily covered with dry straw or litter, when such protection is required in winter. The amateur who lives on the confines of a heath country will therefore see, that he has the means of erecting, at a trifling expense, a place in which he will be enabled to keep such things as Pentstemons, Calceolárias, Verbenas, and even, in mild winters, Pelargóniums, for turning out into the flower-beds in summer. Where litter would be objectionable, a small hot-water apparatus could be introduced, having a two-inch pipe carried along the front, and returned again into the boiler. Of course this would add considerably to the expense; but then all kinds of greenhouse plants could be kept in the greatest safety.

The greenhouse must be got ready as soon as possible for the reception of the plants. If the sashes are moveable, they ought to be taken off and well washed, as well as the walls, rafters, wires for creepers, and the stages; for general cleanliness is essential to the welfare of plants as well as animals. If Vines are grown upon the rafters of the greenhouse, the other things which are kept upon the stages must remain in the open air as long as they are safe from frost. The wood of the Vines will then be pretty well ripened, and they may either be tied close together, or, if the house is properly constructed, they can be drawn out into the open air. Caméllias, which have been out of doors during the summer, should now be re-potted and brought into the greenhouse without delay. In potting them, take care not to use a soil which will set hard; there are some kinds of loam which, when mixed with peat, are little better than mortar, and will ultimately injure the roots of the plants. If the loam you possess has a property of this description, use nothing but rich peat and leaf mould; but if it has not, then equal parts of loam and peat, with about one-fourth of sand and rotten dung, may be used for the mixture.—*R. F.*

HOME CORRESPONDENCE.

Action of Sulphate of Copper on Weeds.—In noticing some remarks I sent you on the sulphate of copper most effectually destroying moss on gravel-walks for at least a twelvemonth, you lately stated that this salt was beneficial to the growth of certain plants. Have you any good facts of this? for I rather doubt it. I have seen garden walks in Devon and Cornwall prepared with rubbish from the mines, which never produced a weed of any kind. This seems to be owing to the presence of such minerals as pyritous copper, iron, and arsenic, which are disseminated in minute particles through the mass. These minerals, at least the iron pyrites, by the action of the air, are continually passing to the state of sulphates; and it is the presence of these salts, as I suppose, which prevents the growth of weeds. Quere, whether by scattering pounded iron pyrites among gravel an equally beneficial result might not be readily obtained?—*J. S. Henslow.*—[In some experiments in the garden of the Horticultural Society, it was found that sulphate of copper does not destroy weeds permanently except in large doses; many things, Grass for example, resist its action. It was found that doses of 2½ to 10 ounces per square rod of this salt applied to turf did no injury to the Grass; but no Clover in any case made its appearance where the salt was applied, although the turf produced it abundantly elsewhere.]

Application of Lime-rubbish and Salt.—I wrote to you in the spring, complaining that my garden had always produced soft, watery Potatoes. Your reply was, that however light my topspit might be, yet that the subsoil was wet and cold. I now believe you are right; for I planted my Potatoes this spring *on the surface* of the ground, and drew earth up at once with the hoe to cover them, about as much as an ordinary first earthing-up; the second earthing-up was done with the spade. The result has been, that all dug up to the present time are excellent mealy Potatoes. I now want a little more information, for I am disposed to think there is very little lime or chalk in our soil, and that an addition of it will do good. Will you, therefore, tell me whether the old mortar from the clearing of bricks and old ceilings of rooms will do as well as new lime or chalk, or whether it has any of the properties of new lime or chalk left in it; or does it only act mechanically by dividing the particles of the soil? I have used salt to new-made Asparagus and Sea-kale beds (the latter raised yearly from seed), twice this summer, with apparent advantage; but to Turnips, raked in with the seed, I fear it will not be beneficial. They appear to be turning yellow; and, on examining the root, I cannot find any grubs, but the greater part of the plants appear to be withering away. Can you tell if this be caused by the salt, or by anything else?—*H. C., Kensington.*—[Old lime rubbish and plaster form a most excellent manure, independently of acting like lime. Salt is probably the cause of the ill health of your Turnips; it will not suit all things equally; but Sea-kale and Asparagus, being coast plants, will naturally feed on salt.]

Lime Water.—I consider your correspondent "C.," in 605 of the *Chronicle*, has admitted water too hastily into his tank. It is many months before the lime in mortar has recovered the carbonic acid from the atmosphere; and until it has done so, the water will infallibly dissolve it in large quantities. A coating of Roman cement will be advantageous, but will not entirely remove this objection. I believe that I considerably accelerated the restoration of the carbonic acid to the cement of a tank by burning charcoal in it, being careful to keep the tank closed. Care should be taken not to allow any one to descend into the tank whilst it is filled with the carbonic acid thus procured. Before the expiration of a twelvemonth, the water in my tank had entirely lost the taste of lime.—*J. S. Henslow.*

Seedling Fruit-Trees.—Many years ago I sent home from Italy seeds of different fruits, which have been raised, and are now beginning to bear. The trees have never been grafted, pruned, or taken any care of since they were transplanted. Two have borne this year, and seem to me to merit further attention, as far as one can judge from the very small quantity of fruit hitherto tasted by me. One of these trees is a seedling red Cherry, from Florence, which is firm, sweet, and well tasted, rather small, but good looking. The other is a brownish-green Pear, also from Florence, which has both good and bad qualities, the former of which I conceive might be improved, and the latter got rid of, by skilful management. It is small, roundish, firm, crisp, juicy, sweet, and very highly flavoured. Perhaps, if kept, it would improve in texture, though quite ripe now. The leaves are small, the stalk long. These two trees will, I hope, become better bearers every year, both by age and by the regular pruning they shall now be subjected to. But is there anything else that can be done to improve the natural qualities of seedling fruit? It may be the case that the first bearing of a seedling tree is smaller, scantier, and in other respects inferior to its ultimate produce; but can art assist its natural capabilities? I should like to know in what manner Mr. Knight treated his seedlings before they attained perfection. Both trees are standards. The fruit of both Cherry and Pear is inferior in size to that of their Italian parents; but in quality, trusting to present indications, I think they will prove equal to them.—*W. Fox Strangways, Abbotsbury.* [The best mode to adopt with regard to seedling fruit-trees is to graft them on well-established, healthy trees, that have been for some time in a fruiting state. Such was Mr. Knight's practice.]

Mr. Ayres' System of managing Wall-trees.—As a gardener, who has at this time trees making a superabundance of breast-wood, but producing no fruit, may I ask Mr. Ayres where the trees acted upon by him may be seen? as I should feel more satisfied were I to see the trees before commencing operations on my own.—*A Constant Subscriber.*—[The system of summer management of Pears recommended by me was adopted, with some trifling difference, at Welbeck, during the time I worked under Mr. Mearns, many years back; though I believe Mr. M. (than whom I do not know a better manager of wall-trees) entertained a different opinion of the philosophy of the process than that inculcated in my paper. Root-pruning I have recommended from physiological considerations, knowing that the surest way of moderating exuberant habits is the radical one of "cutting off the supplies," and from the success which I have seen attend the practice in various places, but more especially in the nursery of Mr. Rivers, the progress of whose experiments I have been watching for some years past. I would, however, guard myself against being considered an advocate for root-pruning. In young, vigorous trees it is an auxiliary to fruitfulness that may be practised with advantage; but in adult specimens, unless indulged in very cautiously, it is quite as likely to produce *sterility* as fruitfulness. Of this I have witnessed several instances. I am afraid it will be of little use to refer to the trees lately under my charge, as the proprietor had always great objections to the garden being shown; so that I think there is not much chance of a stranger seeing the trees; but if he should take a journey to Soham, and the crop of fruit is at all commensurate with the bloom at the time I left the place, I will venture to say he will not regret his journey. As the trees were young and had not covered the walls, they had not been root-pruned—neither is it likely, if my system of summer dressing is continued, they will ever require that process; but in other respects they have been treated as recommended in my paper. Permit me to recommend "A Subscriber" to make himself acquainted with the scientific principles upon which the management of wall-trees is founded; he will then be able to trace effects to their causes, and perhaps discover that my system of management is not suitable for his trees. For this purpose he cannot do better than peruse the "Theory of Horticulture," or the "Suburban Horticulturist," now publishing.—*W. P. Ayres.*]

Budding.—I have been a budder of Roses, Apples, and Pears for the last two seasons, with the wood left entire in the bark, without the least inconvenience from blowing out; they were tied with narrow red tape, because it has no stiffening, and therefore binds better. I am sure that nine-tenths have taken, and that I have saved much time and, what is not of the least consequence, many buds of things to me valuable.—*H. C., Kensington.*

Martin's Splendid v. *Twitchett's Don John Carnation.*—With pleasure I embrace this opportunity of replying to an article inserted in your Journal of the 10th inst., signed "Twitchett, Cambridge." Mr. T. seems gratified that "your sense of justice induced you to insert Mr. Headly's contradiction of Mr. Martin's mis-statement as regards his Carnation Splendid." In reply, I acknowledge that at the show my Bizarre only had to compete with one bloom of Don John; but that bloom, Mr. Holliday, the exhibitor of my Splendid, informs me, was selected out of a box of twelve or more blooms by a person on Mr. Headly's behalf, and while such selection was being made, a second person came and assisted in the choice. Therefore I am led to believe the best bloom was chosen, otherwise there must have been an error in the judgment of the parties who made the choice. I beg respectfully to deny Mr. Twitchett's assertion that I "indulged in a fortnight's deliberation without taking the least notice of his challenge." If he refers to the "notices to correspondents" of the "Gardener's Gazette" of the following week, he will find that my letter could not be inserted. I therefore, on the second week, sent a challenge as an advertisement, proposing to show 11 blooms for 25 guineas; and why should not I have a choice of numbers as well as Mr. Twitchett? If Don John is really the best Scarlet Bizarre in England, I cannot account for his diffidence in meeting my challenge. I consider myself justified in this my proposition, as my stock is very limited, compared with the many orders I have to execute from England, Ireland, and Scotland, so that the remainder will be reduced so low as to prevent my showing a larger quantity; and I think every experienced florist will agree with me in saying that eleven blooms are sufficient to test the merits of a Carnation.—*J. Martin, Northampton.*

Martin's Splendid v. *Twitchett's Don John Carnation.*—Having been a party who purchased Don John of Mr. Twitchett, by whom it was sent out as the best Scarlet Bizarre Carnation in England, I should be glad to be informed, through the medium of your Paper, how it happened that Martin's Splendid was proved to be a superior flower, by having the prize awarded it in preference to Don John. I should also be glad of information (not having been present at the exhibition), whether there was any other bloom of Don John exhibited, that would, had it been brought into competition, have beaten Martin's Splendid. If not, I think there can be but one opinion upon the subject; as it cannot but be supposed that the best bloom of Don John was put up. If the prize was unfairly awarded to Splendid, the onus of the blame rests with the judges; otherwise, it must have been an error of judgment on the part of Mr. Twitchett, to advertise an article that was to be superior to anything of the kind, and then to have the pet beaten, although grown by himself or his neighbour, Mr. Headly.—*Dianthus.*

Eúcomis nana.—This has been planted four years in a south border of the Botanic Garden, without the slightest protection, and it flowers freely. Should Eúcomis striata and punctata be found equally hardy, I will communicate accordingly.—*N. S. Hodson, Bury St. Edmonds.* [They are.]

Ipomœa Learii.—This plant produced about twenty pods of seed last year with me. Four or five of the seedlings have bloomed, and they have evidently a disposition to sport, one plant producing a larger and deeper-coloured flower than the parent, and another much smaller and paler. A plant of Ipomœa Sellowi grew and bloomed with the parent. Another and much stronger plant produced no seeds; the latter was in a lower temperature, but the roots of each had found their way into a bark-bed. The deep-coloured seedling above mentioned is the only one producing seed this year; it is growing intertwined with a plant of Ipomœa insignis that has produced hundreds of flowers. How rarely is this latter now seen, though second to none in beauty, and far more prolific in flowers!—*Flora.*

Potatoes in India.—A correspondent informs us, that when he went to India, threescore years ago, a basket of Potatoes, weighing about a dozen pounds, was occasionally sent, as opportunity offered, by Warren Hastings, the Governor of Bengal, to the Governor of Bombay, and was considered a very acceptable present. On reception, the members of the council would be invited to dine with the governor to partake of the rare vegetable. Somehow or other the Potatoe was introduced into Guzerat, and, in process of time, Bombay became well supplied with it; so well, that the market had ever an abundance at a low price and very good. This may imply a lapse of twenty years. When the Bengal and Madras armies rendezvoused at Bombay, on their way to Egypt, every transport was supplied with as many Potatoes as the captains would take—slung under the tops, under the chains, over the stern, &c. The general in command of the army of Egypt, who superintended all its equipments, although he did not go with it, (Sir Arthur Wellesley,) was much struck with the resources of Bombay, in equipping and refitting an army, transports, &c., and, among other things, with the unbounded supply of Potatoes and fine Onions; and—having always both eyes open—it struck him that the Potatoe might be advantageously grown in Mysore. He condescended to confer with the writer of this mem., who happened to know something of the soil, climate, &c., of Mysore; and the result was, sending, at Sir Arthur's expense, 500 baskets of Potatoes, each weighing 14 lbs., to the resident at Mysore, with instructions as to the distribution of them for seed, the cultivation, &c., &c. Now, it is understood that Potatoes are as good, as plentiful, and as cheap in Mysore as in Bombay or any other place

The Laurel.—In answer to a correspondent, who inquired some time since what insect it was which destroyed the leaves of the common Laurel, I beg to inform him that I have observed the common garden snail in the act of eating the leaves; and that I have some plants, whole shoots of which have been so stripped of their foliage, that they have been thrown back for the whole season.—*R. G.*

To prevent the Attack of Wireworms..—You state, in No. 33, that you know of no remedy to prevent wireworms from attacking Carrots, except the application of spirits of tar. I would recommend to your notice a recipe, which I think would be equally applicable to all kinds of plants. I certainly intend to try it with Carnations, &c. It is to spread a layer of spent hops, from two to four inches thick, and upon these to form the bed upon which the Carnations are to be planted. It is not to be supposed that this will destroy the insects; but I am told that the scent is so offensive to them that they will not come near it.—*R. G.*

Mildew on Peas.—It was a glorious day for the world when the dogmas of the Stagirite philosophy were weighed in the balance and found wanting; when their funeral dirge was sung, and the remains of their darkening commentators were laid in the silent grave. It was a blessed era in the world's history when the true principles of scientific investigation burst through the clouds of ignorance and dispelled the darkness in which men's minds were ensconced; and when nothing was admitted into the province of philosophy, whether belonging to mind or matter, that had not facts for its foundation. Even the cause of mildew on Peas is not unworthy of the Gardener's attention, if he has any regard for the welfare of his crop. Your correspondent "E. M." admits that the mildew in damp cellars is caused by damp, and also that the "canvas mildew" proceeds from the same cause; but he "considers mildew on plants and the same in damp cellars, to be different species." What proof has he for thinking so? Have the reporters of the small objects of nature, such as Bauer and Fries, found them to be different species; or have any of the members of the Microscopical Society made the discovery? Do they belong to the genus Uredo, or Puccínia, or Monilia? Or what family of minute Fungi claims them? These are questions which I would thank "E. M." to answer, and would feel grateful for the honour done me. But perhaps I have as good reason for supposing the Ranunculus aquatilis to consist of different species, when I find it growing at one time in dry places, and at other times in lakes, ditches, and rivers. Although "E. M." considers mildew in plants and in damp cellars to be different species, I believe it is generally understood that Fungi never attack organised matter in a healthy state, and that disease must precede the attack. I think there is nothing more unreasonable in supposing that an over-supply of moisture may cause disease in a crop of Peas, so as to enable the Fungi to perform their appointed work, than in supposing that a want of moisture may be the cause of mildew. When it is believed that both states may produce the evil complained of, it is the duty of the Gardener to endeavour to guard against both extremes. Since the ground was drained I have never been troubled with the mildew on Peas—although before it used to be common; and this season my crops of Peas on light soil have been greatly benefited by a liberal supply of water, containing a little ammoniacal liquor. It is of little use for Gardeners to be like Coleridge's "Ancient Mariner," when he says—

> I look'd upon the rotting sea,
> And drew my eyes away;
> I look'd upon the rotting deck,
> And there the dead men lay!

Gardeners may not have the opportunity of looking upon rotting seas; but when such a thing as rotting Peas occurs in soil as dry as dust, it does not become them at all to shut their eyes, and keep them closed like statues; but they should endeavour to act the part of the skilful physician, who knows when to withhold water, and when to use it.—*Peter Mackenzie.*—[Nevertheless our ingenious correspondent is in the wrong, as we shall take an early opportunity of showing him]

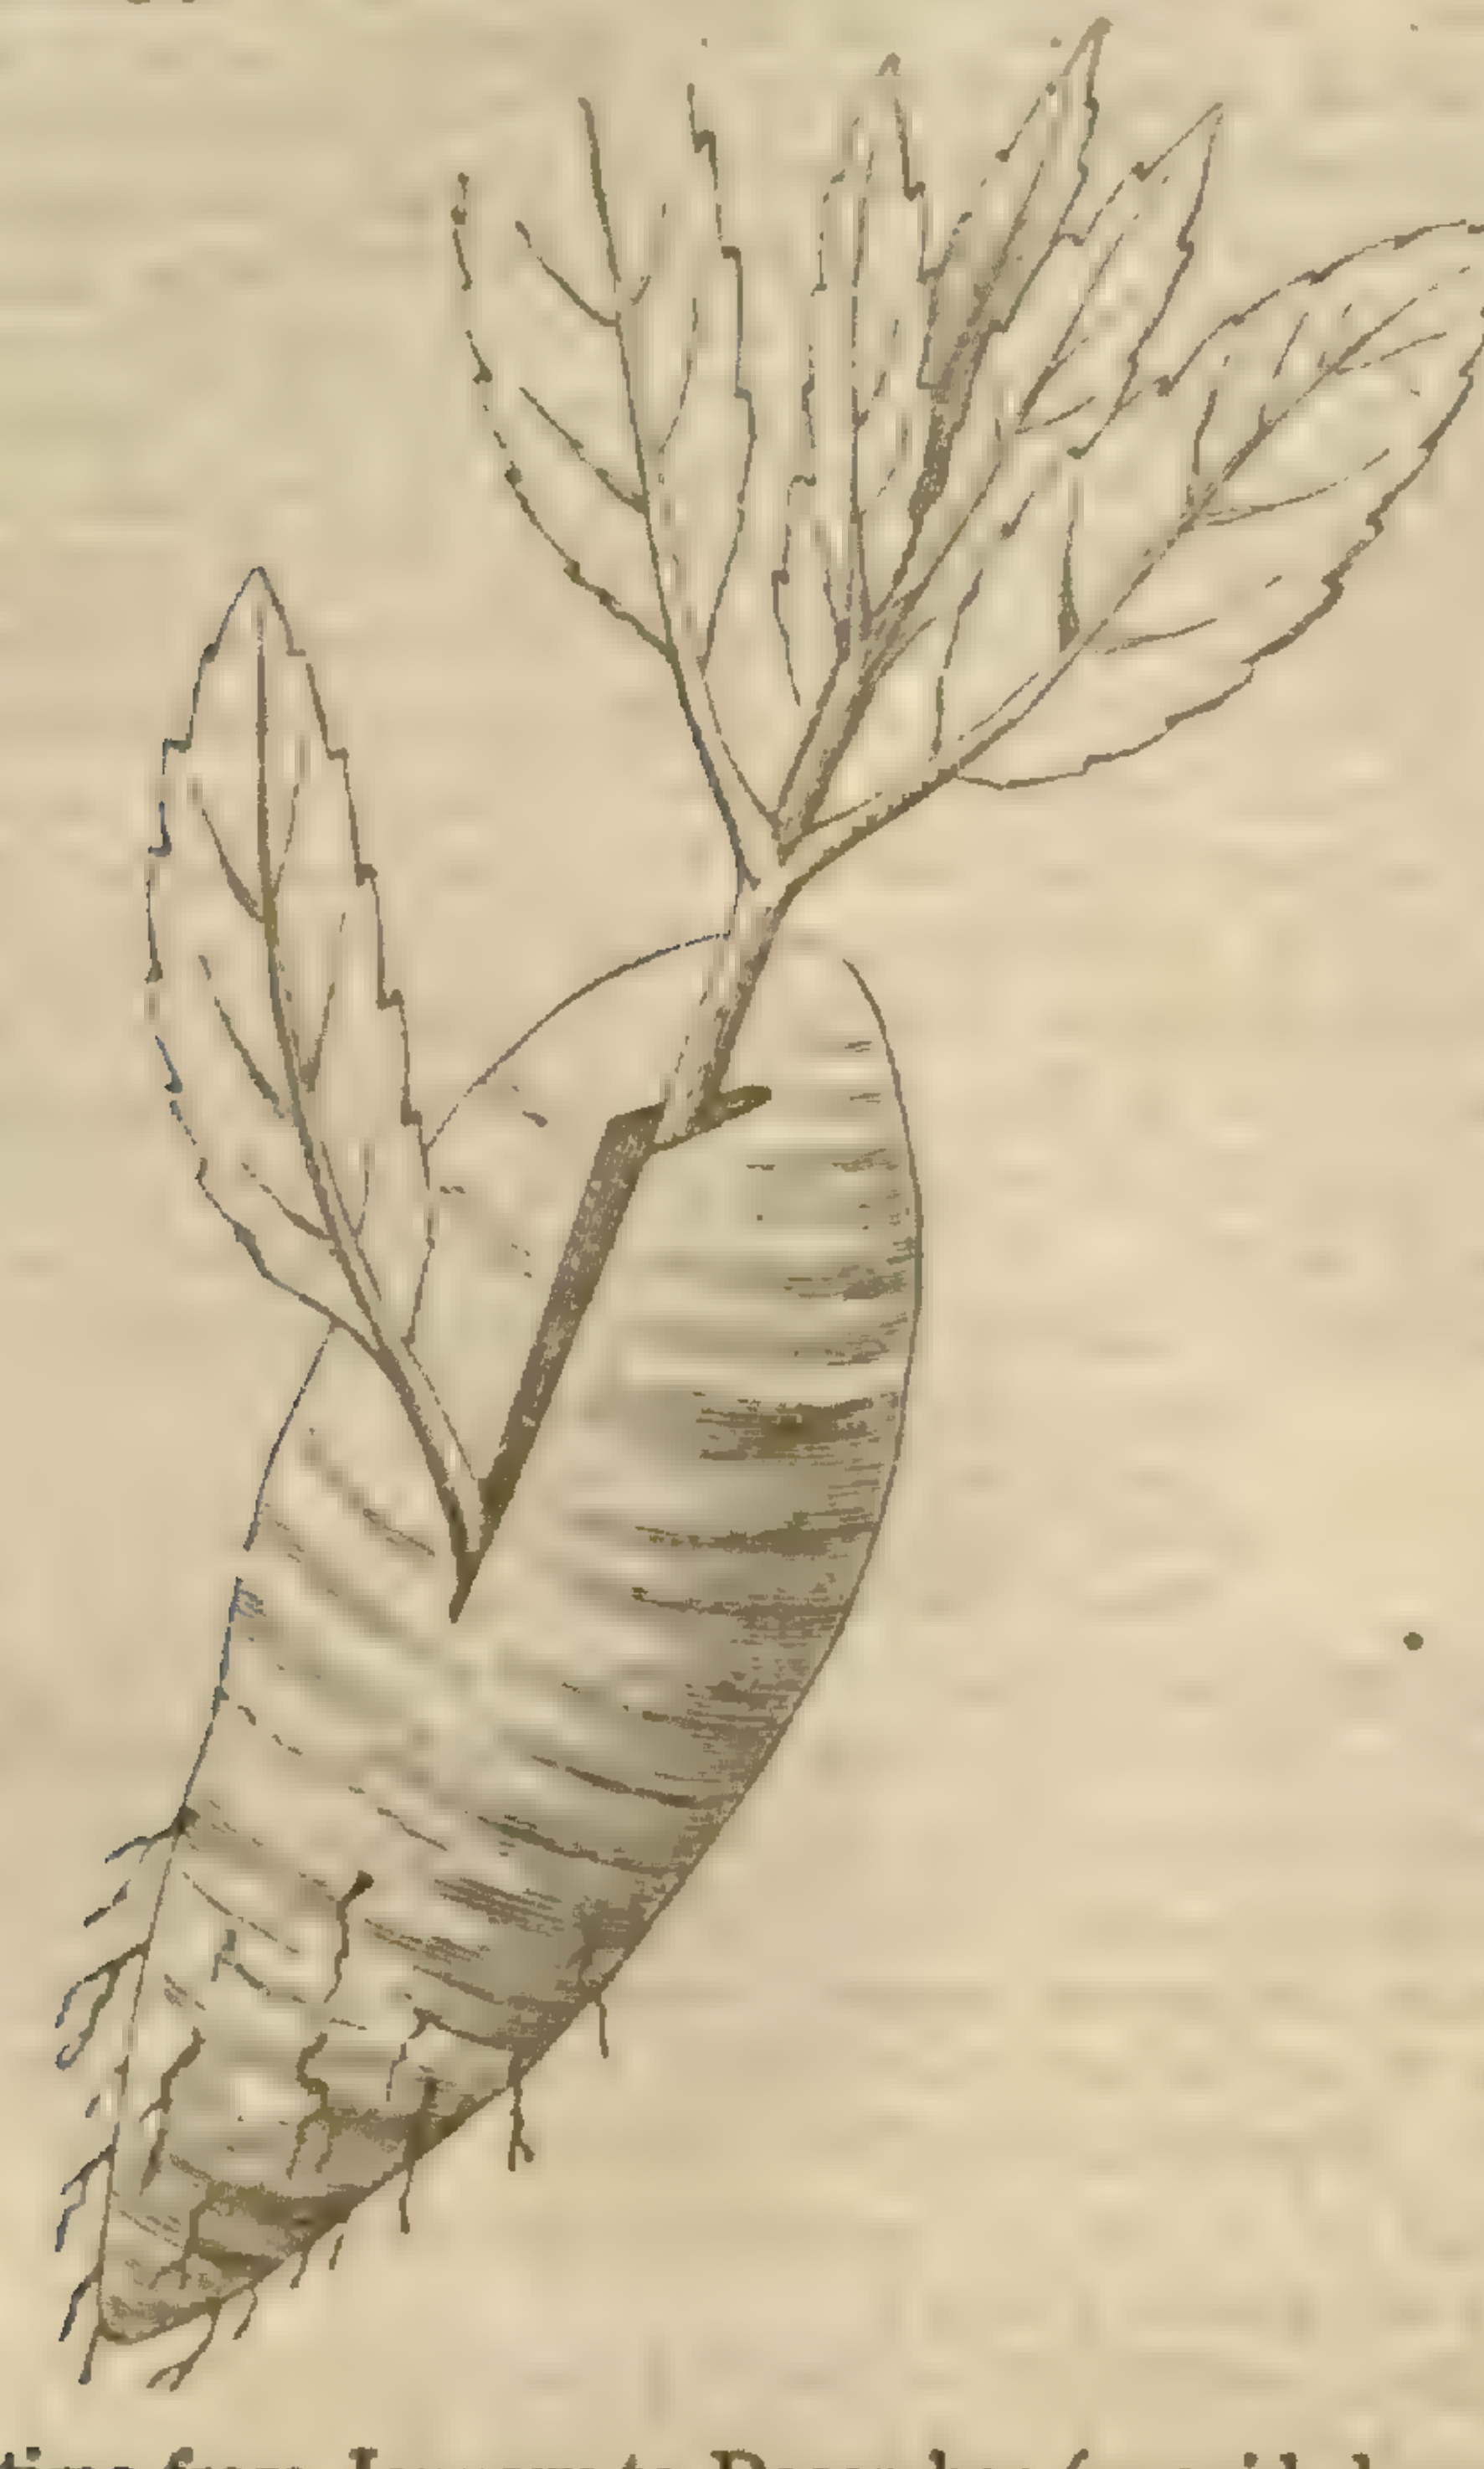
Araucária imbricata.—You are certainly right in your veto against the assumed hardihood of Araucária braziliensis. Araucária imbricata, we know, is sufficiently hardy, and doubtless your correspondent has confounded species essentially distinct. I saw at Sudbury Hall the Araucária braziliensis perishing, though under the protection of a thatched enclosure and roof, and with the safeguard too of that skilful curator, Mr. Mitchell.—*J. Murray.*

The Sting of a Wasp.—Having been stung the other day by a wasp, I diligently applied, and that repeatedly, Battley's preparation of opium, which happened to be at hand, and I can only say that it was of no avail, and that the pain continued from 5 p.m., till 9 a.m., the following day! no great proof of its curative power. Touching the remark of your correspondent, I have only therefore to say, *valeat quantum.* I speak feelingly of its utter inutility.—*J. Murray.*

Black Beetles and Cockroaches.—I have seen in your columns many methods for destroying these nuisances in kitchens. The following plan, I have been assured, never fails to produce the desired effect, and does away with the necessity of using poisonous or deleterious ingredients, and also saves the trouble of setting traps. When Cucumbers are plentiful, cut one up in slices without paring, and rather thicker than is usual for the table; these should be strewed about the kitchen at night. When that vegetable is scarce, the rind alone will answer the purpose equally well. In a fortnight's time the beetles and cockroaches will be greatly thinned, or will have disappeared until the following season; when, if necessary, it will be easy to repeat the experiment.—*R. G.*

FOREIGN CORRESPONDENCE.

Paris.—The Dahlia season appears to be commenced in England under the most auspicious influence of genial weather; but far different is our situation. The whole circuit of Paris can scarcely present one perfect bloom, in consequence of the long-continued drought, and excessive heat which literally broils the flowers in the bud. My purpose is not, however, to recapitulate our troubles, but to convey some information respecting this beautiful flower which may be of service to Dahlia growers, especially at this time, when they they are anxiously watching the first opening flowers of their seedlings. I know that their days and nights are now almost entirely occupied with shading, tying, earwig hunting by candle-light, and a hundred other things, previously to an exhibition; and that in spite of wind, hail, slugs, thrips, earwigs, and a legion of known and unknown enemies, visions of silver salvers and gilt cups are constantly flitting before them. *Nil desperandum* is the motto of the florist. There is, however, one mortification more galling than any of the evils I have yet named; I mean the loss of a fine seedling. How often have I heard lamentations, that Mr. A.'s seedling which took the first prize at Salt Hill, or Mr. B.'s which was first at Salisbury, have either not broken, or perished in the winter! These are no solitary cases; they occur every year; and thus, perhaps, the hoped-for reward, commensurate with the expense and trouble of rearing several thousand seedlings, is for ever lost. Yet English growers seem to have done nothing to counteract it, but quietly submit, *à la Turque,* as if it were a decree of fate. They manage these things better in France. No one here will trust to the chance of his seedling root breaking, when he has not only the power of preserving the stock by other means, but of multiplying it almost *ad infinitum* in August, September, and October by "grafts," which, under proper management, seldom or never fail to live through the winter, and give abundance of cuttings in the spring. This system has been long practised in this country, not only for seedlings, but also for new and scarce varieties; it is, moreover, particularly applicable to those kinds which are horny-rooted and difficult to break, or, such as "Taylor's Sultana," with long stringy tubers, which seldom live through the winter, and to others which break late: to all such, this mode is recommended with the greatest confidence of success. The operation is exceedingly simple (see figure), and may be performed at



any time from January to December (provided you have a good growing heat), not only with young green shoots, but with others more advanced, if not hollow or pithy. The usual manner is to take a scion with six or eight leaves, cut it smooth below the joint, take off one of the lower leaves without injuring the eye, and then cut away a portion (½ or ¾ of an inch) of the skin or fleshy part of the wood between each of the lower eyes. Have ready a good sound piece of tuber of the last or present season (if ripe), in which make a slanting longitudinal incision of one or two inches, according to circumstances, and about half an inch wide at top, gradually tapering off to the bottom, and fix the scion firmly into it. The root should then be planted in a pot, with the grafted part just below the mould, and placed under a bell-glass, or in a warm close frame, but the former is best. In eight or ten days the union will be complete, and air may be gradually given; after a short time you will be able to head it down either for cuttings, if in spring, or grafts for summer and autumn. It is advisable to leave at all times four eyes, to ensure a vigorous growth; and also to shift the plant into a larger pot occasionally. I have known upwards of 100 good plants obtained in this way, from one single graft. The only difficulty will be in the months of November and December, when the plants are liable to damp off, because it is necessary to keep them in a green state, and just growing, but nothing more. At the end of January, or whenever you commence propagation, they can be removed to the hotbed or stove; and experience has taught me that, with care and attention, they will produce a multitude of cuttings, *earlier* than can be obtained from ground roots. Many of the Paris florists cultivate them very extensively after this manner for the markets and cemeteries of Père la Chaise and Montmartre. I am confident that not less than 80,000 or 100,000 are grafted every season; and the average price of those sold does not, perhaps, exceed six or eight sous. The greater number of these perish, as a matter of course; indeed it was never intended for them to live beyond the autumn. Some few, however, throw out roots from the lower eyes, if the operation is performed when the wood is tender. I am not going to defend the practice of selling Dahlias in this state; it is a deception unworthy of any respectable dealer. Nevertheless, it is not altogether to be discarded because it is subject to abuse. In its legitimate application it will be found a valuable means of preserving any scarce variety; and as such I recommend it, being well convinced that no one will have cause to regret having tried its efficacy.

PROCEEDINGS OF SOCIETIES.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.

Sept. 13.—This, the last exhibition for the season, was held in the Surrey Zoological Gardens, and was numerously attended. The cut flowers, particularly the Dahlias, were good; but there was a deficiency amongst the miscellaneous collections of plants, especially in the amateur's class. By far the best collection of plants exhibited was from Mr. Bruce, of Lower Tooting, who sent a well-grown specimen of Witsénia corymbosa; two healthy plants of Crówea saligna, covered with a profusion of delicate pink blossoms; a noble specimen of Gesnera splendens; Trevirana coccínea, forming a mass of bloom at least two feet and a half in diameter, with several Ericas and Amaryllises. Mr. Clark exhibited one of the best cultivated specimens of Gardóquia Hoókeri which we have lately seen; this plant generally assumes a sickly appearance as soon as it attains any size; but the present one was in perfect health, and remarkably full of bloom. Thunbérgia alata, and T. alata alba, trained over circular horizontal trellises, came from the same person, with Erica colorans, E. carinata, and Philibértia grandiflora. From Mr. Atlee were a fine plant of Witsénia corymbosa, the flowers of which were not sufficiently expanded; Státice pubérula, grown in great perfection; two specimens of the little Erica cúbica, crowded with clusters of delicate purple flowers; and E. verticillata, of the most brilliant scarlet. Mr. Patterson sent a handsome plant of Gomphocarpus fruticosus, trained over a circular trellis, upon which it appeared to much advantage; its numerous pendent bunches of white flowers and large inflated green pods presenting a pretty appearance. The collection of Mr. Jackson, of Kingston, consisted principally of Heaths, amongst which we noticed Erica triceps, a lovely little white variety, with prominent brown stamens; E. mammosa pállida, a very ornamental species, blooming in dense clusters; and E. ténnis, white, with long slender flowers; with these was a good specimen of Státice arbórea. Mr. Scorer exhibited a well-bloomed collection of dwarf Cockscombs; and a dozen healthy plants were also sent by Mr. Conolly, of Acre Lane. Amongst the Dahlias there were some excellent flowers, particularly in the stands of Mr. Brown, of Slough, and Mr. Bragg, of Windsor; and considering the late adverse weather, the Roses exhibited by Mr. Paul and by Mr. Denyer were highly creditable. The Seedling Dahlias sent were numerous and of various degrees of merit. As the greater portion had no names attached to them, we have no means of bringing them to the knowledge of our readers. This, however, is of but little consequence, as the best were not included amongst the unnamed. Four blooms of Seedlings of 1841 were required. The first prize was awarded to Turvill's *Essex Triumph,* a fine and very deep maroon-coloured flower, of first-rate properties, with petals of good form and substance, centre finely elevated, and general form perfect. *The Empress of the Whites,* from Smith of Hornsey, obtained the second prize. This is a flower of good size, but the centre appears to be too full of unexpanded petals. The third prize was awarded to Mitchell's *Beauty of Surrey,* a flower that attracted much attention from the novelty of its colour and appearance; the ground colour of the petal is a delicate rose, with a deep edging of bright cherry colour. This flower forms a very pleasing and desirable variety, differing as it does from all others that we have: it is also full-sized. A creamy white from Mr. Edwards of York, named *Mrs. Jas. Jackson,* was selected by the judges and recommended for a prize. Many of the flowers that were not noticed, were first-rate varieties or sorts of great merit: viz. *Mountjoy's Virgil,* a deep purple of exquisite form; *Smith's Sir R. Sale,* a flower of much the same character and colour; *Brown's Perpetual grand,* a large and finely-formed crimson; *Brown's Miranda,* and *Queen of Trumps,* two light mottled flowers well deserving attention; *Oakley's Surprise,* crimson, regularly tipped with white, the best formed flower of its class we have yet seen; and several others, inferior in merit, but deserving to be cultivated in the border—though not of sufficient importance for showing. The following is a list of the prizes awarded:—Class 1. Amateurs: Dahlias, 24 *Blooms*—1, Maria, Lady Middleton, Duchess of Richmond, Regina, Beauty of the Plain, Great Western, Grande Baudine, President of the West, Bridesmaid, Springfield Rival, Unique, Marquis of Lansdowne, Penelope, Bedford Surprise, Phenomenon, Springfield Purple, Beauty of Wakefield, Andrew Hofer, Argo, Metella, Maid of Bath, Indispensable, Widnall's Queen, and Burnham Hero, *Gold medal,* Mr. Bragg; 2, *large silver do.,* Mr. Headly; 3, *middle silver,* Mr. Humber; 4, *small silver,* Mr. Hunt. For 12 *blooms*—1, Admirable, Pickwick, Catleugh's Tournament, Lady Middleton, Lewisham Rival, Grande Baudine, Unique, Suffolk Hero, Eva, Optima, Duchess of Richmond, Fanny Keynes, *large silver,* Mr. Trevers; 2, *middle silver,* Mr. Cook; 3, *middle silver,* Lady Paget; 4, *small silver,* Mr. Wildman; 5, *second small silver,* Mr. Lidgard. Best 12 Asters: *small silver,* Mr. Lidgard. Collection of Miscellaneous Plants: *middle silver,* Mr. Townley. Heartsease, 24 *varieties: large silver,* Mr. Bawtree; 2, *middle silver,* Mr. Bridges; 3, *small silver,* Mr. Bragg. Collection of Cut Flowers: 1, *middle silver,* Mr. Rawlins; 2, *small silver,* Mr. Bushell. Best 4 sorts of Fruit, (*Grapes and Pines excluded,*) Apples, Pears, Plums, and Peaches, *middle silver,* Mr. Lidgard. Collection of Vegetables: Carrots, French Beans, Cauliflowers, and Cabbages, *middle silver,* Mr. Lidgard. Class 2: Gentlemen's Gardeners.—Collection of Miscellaneous Plants: 1, *gold medal,* Mr. Bruce; 2, *large silver,* Mr. Clark; 3, *middle silver,* Mr. Atlee; 4, *small silver,* Mr. Patterson. Cockscombs: *middle silver,* Mr. Scorer. Dahlias, 24 *varieties:* 1, Northern Beauty, Grace Darling, Essex Rival, Prince of Wales, Constancy, King of Roses, Burnham Hero, Amato, Rienzi, Rose Unique, Andrew Hofer, Duchess of Richmond, Euclid, Catleugh's Tournament, Windmill Hill Rival, Rival Sussex, Phenomenon, Chancellor, Maid of Bath, Attila, Bridesmaid, Pickwick, Springfield Rival, and Beauty of the Plain, *large silver,* Mr. Turvill; 2, *middle silver,* Mr. Brown; 3, *middle silver,* Mr. Dove; 4, *small silver,* Mr. Taylor; 5, *second small silver,* Mr. Bennett. Best 24 Asters: *small silver,* Mr. Foster. Heartsease, 36 *varieties:* 1, *middle silver,* Mr. Foster; 2, *small silver,* Mr. Hancock. Collection of Cut Flowers: 1, *large silver,* Mr. Bence; 2, *middle silver,* Mr. Parsons; 3, *small silver,* Mr. Moseley. Best 4 sorts of Fruit (*Grapes and Pines excluded*): Melon, Figs, Pears, and Plums, *middle silver,* Mr. Moseley. Collection of Vegetables: Cucumbers, Lettuces, Onions, Potatoes, French Beans, Turnips, Carrots, Beet, &c., *middle silver,* Mr. Atterton, gr. to — Shears, Esq. Class 3: Nurserymen, Market Gardeners, and Florists.—Best 50 Dahlias: 1, Candidate, Phenomenon, Hylas, Chef-d'Œuvre, Duchess of Richmond, Indispensable, Springfield Rival, Nicholas Nickleby, Argo, Metella, Lady Anne Murray, Vitruvius, Optima, North Star, Ne plus ultra, Duke of Cornwall, Conductor, Beauty of the Plain, Catleugh's Eclipse, Unique, Maid of Bath, Bedford Surprise, Constancy, Springfield Purple, Marquess of Lansdowne, Eva, Catleugh's Tournament, Majestic, Lady Middleton, Bridesmaid, Widnall's Eclipse, Will Watts, Prince of Wales, Grace Darling, Pickwick, Grande Baudine, Climax, Rienzi, Penelope, Emperor of China, Amato, Maria, President of the West, Widnall's Queen, Admirable, Union Tournament, Conservative, Hero of Nottingham, and Andrew Hofer, *gold medal,* Mr. Brown; 2, *large silver,* Mr. King; 3, *middle silver,* Messrs. Brown and Atwell; 4, Mrs. Shelley, Bishop of Winchester, Will Watts, Wheeler's Maria, Whale's Attila, British Queen, Grace Darling, Jeffrey's Lady Acland, Eva, Jones' Francis, Miss Chester, Young's Twyford, Perfection, Grande Baudine, Wildman's Climax, Phenomenon, Jackson's Lady Cooper, Royal Standard, Brown's Monarch, Widnall's Eclipse, Brown's Chameleon, Andrew Hofer, Penelope, Fanny Keynes, Lancashire Witch, Bishop of Salisbury, Suffolk Hero, Girling's Ploughboy, Maid of Bath, Keynes' Constancy, Adams' Prince Albert, Prince of Wales, Chancellor, Northern Beauty, Lady Middleton, Sir R. Throgmorton, Argo, Burnham Hero, Queen of Beanties, Girling's Favorite, Admirable, Catleugh's Tournament, Wildman's Haidée, Optima, Duchess of Richmond, Sulphúrea perfecta, Bridesmaid, Marchioness of Westminster, Glory of Plymouth, *middle silver,* Mr. Willmer; 5, *small silver,* Mr. Girling; 6, *second small silver,* Mr. Gaines. *Best* 24 *varieties, large silver,* Mr. J. Tyler; 2, *middle silver,* Mr. T. Buck; 3, *small silver,* Mr. Henbrey. Best 36 Asters: *small silver,* Mr. Henbrey. Collection of Miscellaneous Plants: 1, *large silver,* Mr. Jackson. Collection of Roses: 1, *large silver,* Mr. Paul; 2, *middle silver,* Mr. Denyer. Heartsease: 50 *varieties, large silver,* Mr. Brown; 2, *middle silver,* Mr. King. Collection of Cut Flowers: *middle silver,* Mr. Lee. Best four sorts of Fruit, (*Grapes and Pines excluded,*) Figs, Apples, Pears, and Peaches, *middle silver,* Mr. R. J. Chapman. Collection of Vegetables: Potatoes, Onions, Cabbages, Endive, Mushrooms, Capsicums, Tomatoes, Vegetable Marrows, Turnips, Carrots, Beet, &c., *middle silver,* Mr. Gaines. Open to all Classes—Best 6 specimen Plants: 1, *large silver,* Mr. Pawley; 2, *middle silver,* Mr. Wilson. Best Single ditto: Lílium lancifólium, *large silver,* Mr. Groom; 2, *middle silver,* Mr. Conolly; 3, Lisianthus Russellianus; *small silver,* Mr. Jackson. Best Seedling Dahlia of 1841: *middle silver,* Mr Turvill; 2, *small silver,* Mr. G. Smith. Best Seedling Heartsease: *small silver,* Mr. Brown. Best Basket of Grapes: 1, *middle silver,* Mr. Chapman; 2, *small silver,* Mr. R. J. Chapman. Best Pine Apple: *middle silver,* Mr. Meade.

FLORICULTURAL SOCIETY.

Sept. 6.—The following is a list of the Dahlias sent for judgment, with the opinion of the Members respecting them: Mr. Turvill, Essex, sent 9 blooms of *Essex Triumph,* 1841, (dark maroon,) the general form of which was excellent, and the quality first rate: with 2 blooms of *Lady Healey* (blush white and purple), and 1 of *Rosalind* (red), both seedlings of 1842; general form not good, but blooms are requested to be sent again. From Mr. Whales, of Elcot, 6 blooms of the *Hero of Stonehenge,* 1841, (crimson), general form good, but the petals irregularly expanded, —second rate. From Mr. Bushell, Kennington, 6 blooms of *Pet Rival,* 1841, (light crimson),—not worthy of cultivation. From Mr. Brown, Slough, 6 blooms of *Queen of Trumps* (white and purple), and 6 of *Miranda* (blush white and purple mottled), both of 1841; the former good, but generally imperfect in the eye,—second rate; the latter deficient in form, and also second rate. From Mr. Gunner, of Walworth, blooms of *Elizabeth* (rose shaded in centre), and *Champion of Walworth* (purple), both of 1842; the former not worthy of cultivation, the latter to be sent again. Mr. Domyer, of Walworth, sent a bloom of *Elizabeth,* 1842, (rose), —not worth cultivation. From Mr. Gaines, of Battersea, 6 blooms of *Lady Prudhoe,* 1841, (blush white),—not worth cultivation. From Mr. Kinghorne, of Twickenham, 6 blooms of *Chieftain,* 1841, (ruby),—general form good, but second-rate. Mr. Brown, Worcester, sent 10 blooms of a white Dahlia, but without a name; consequently, no opinion was passed upon it.

COUNTRY SHOWS.

Salthill Grand Dahlia Show, Sept. 16.—This exhibition was held in the extensive grounds attached to the magnificent hotel lately opened, adjoining the railway station at Slough: tents were erected in the grounds in which the flowers were exhibited, and every arrangement was made that could conduce to the pleasure and comfort of the visitors. The object that first attracted our attention, was the tent in which the seedlings were exhibited: those selected for prizes were placed in the following order:—*Seedling of* 1841, 4 *blooms:* 1, *Bragg's Antagonist,* white: this is a full-sized and finely-formed flower, with good petals and great purity of colour. In consequence of its being placed first by the judges, Mr. Wildman's prize of 5 guineas for the best Seedling White of 1841 was decided in its favour; and as it obtained the first prize at the last evening meeting of the Floricultural Society, this point, by the decision at Salthill, is now settled. 2, *Essex Triumphant,* Turvill—this noble flower is quite a model of perfection, fine in form, and deep in petals, with a centre high and finely developed; the colour is a very deep rich maroon, the petals are finely cupped, of good substance, and well arranged. 3, *Virgil,* Mountjoy—deep crimson, a flower possessing a very fine form, with a good centre, and full depth of petals. 4, *Beauty of Sussex,* Mitchell—this is a desirable flower, and very striking from the peculiarity of its tints; the ground colour of the petals is a delicate rose, with a deep edging of mottled cherry colour; it is a good-sized flower. 5, *Empress of the Whites,* Smith of Hornsey—better blooms than we had previously seen of this flower; with well-formed petals of good substance; the white is good, and the centre better developed than at previous exhibitions; this will prove a very useful flower. 6, *Sir R. Sale,* Smith of Hackney—deep crimson; this combines good general form, with a firm and well-shaped petal; the eye is well up, with good depth of petals. 7, *Hero of Stonehenge,* Whale—crimson; a flower of good general form, but the arrangement of the petals is rather confused. 8, *Miranda,* Brown —a full-sized flower; colour light, mottled with crimson. These eight flowers were selected by the judges for the prizes; and two others were recommended. 9, *Perpetual Grand,* Brown's—fine crimson; a large and very useful flower; centre finely formed. 10, *Swindon Rival,* Compton—rosy crimson; this flower has a well-formed petal, but it did not appear to be any improvement upon flowers already out in the same way. There were many other seedlings exhibited, amounting in all to 21. Of the seedlings of 1841, Stein's Sir R. Chester appears to promise well; and there were 3 Seedlings from Mr. Bragg, a dark, with good proportion; an orange, novel in colour; and a curious-coloured purple, with a fine petal. The remaining prizes were awarded in the following order:—Class 1, Amateurs, or Gentlemen's Gardeners, 24 *varieties:* 1, Mr. Bragg; 2, Mr. Warne, afterwards disqualified; 3, Mr. Ford; 4, Mr. Weedon. Class 2, 6 *Blooms:* 1, Mr. Bragg; 2, Mr. Ford; 3, Mr. Humber; 4, Mr. Howard. Class 3, Nurserymen, 36 *Blooms:* 1, Mr. Brown; 2, Mr. Harrison; 3, Mr. Keynes; 4, Mr. Stewart. Class 4, 12 *Blooms:* 1, Mr. Brown; 2, Mr. Stewart; 3, Mr. Maule, Bristol; 4, Mr. Harrison. The display of fruit and plants in the centre of the large tent was good, and the collection of Heartsease and other cut flowers very creditable to the growers.

Hertford Horticultural Society, Sept. 8.—The third exhibition took place, at the Shire Hall, Hertford. The following is a List of the Prizes awarded:—Pines, 1, Mr. Brown, gr. to Lady Meux; 2, Mr. J. Hamp, gr. to E. Chuck, Esq. Melon, *Green Flesh,* 1, Mr. T. Dawson, gr. to Earl Cowper; 2, J. I. Pryor, Esq. *Scarlet Flesh,* 1, Mr. J. Dawson, gr. to Lord Melbourne; 2, Mr. Brown. Grapes, *Black,* 1, Mr. C. Judd, gr. to G. Knott, Esq.; 2, Mr. T. Dawson. *White,* 1, Mr. C. Judd; 2, Mr. T. Dawson. Peaches, 1, Hon. Capt. Cust; 2, Mr. J. Dawson. Nectarines, 1, Mr. Terry, gr. to Lady Buller; 2, Mr. Brown. Plums, 1, Mr. J. Dawson; 2, C. G. Thornton, Esq. Grapes, *Out of Doors,* Miss Hadsley. Pears, 1, C. G. Thornton, Esq.; 2, Mr. T. Dawson. Figs, Mr. T. Dawson. Specimen Plant, 1, C. B. Warner, Esq.; 2, Mr. Plumbly, gr. to J. J. Dimsdale, Esq. Miscellaneous Plants, 1, Mr. Williams, gr. to J. Warner, Esq.; 2, Mr. Slowe, gr. to W. R. Baker, Esq. Dahlias, 50 *varieties,* Mr. S. Green. 24 *varieties,* 1, Rev. M. Skynner; 2, Mr. S. Green; 3, Mrs. Hanbury. 12 *varieties,* 1, Rev. M. Skynner; 2, Mrs. Hanbury; 3, Mr. S. Green. 6 *varieties,* 1, Rev. M. Skynner; 2, Mrs. Hanbury; 3, Mr. C. Green. *Best Seedling,* Mr. S. Green. Cockscombs, 1, Mr. T. Dawson; 2, Miss Hadsley. China Aster, 1, Mrs. Foster; 2, Mr. J. Dawson; 3, Mrs. Hanbury. Cyrilla pulchella, Mr. Williams. British Plants, 1, Mr. Simmonds, gr. to the East India College; 2, Mr. D. Sprigings. Fuchsias, Mr. Williams. Cut Flowers, 1, Mr. Williams; 2, Mr. Milne, gr. to C. S. Chauncy, Esq.; 3, Mr. Slowe. Roses, Mr. Milne. French Marigolds, Mrs. Hanbury. Extra Prizes:—Mr. Plumbly, for a *Collection of Cape Heaths;* Mr. Slowe, for a *Specimen Plant;* Mr. J. Dawson, for a *Pine;* Mr. G. Smith, for *Dahlias;* Mr. T. Dawson, for *Cyrilla pulchella, Morello Cherries,* and *Barbadoes Queen Pine;* Mr. Brown, for *Peaches;* Mr. Terry, for *White Muscat Grapes;* Mr. Bentley, gr. to J. M. Carter, Esq., for *Black Hamburgh Grapes.* A few Cottagers' Prizes were also awarded.

Limerick Practical Horticultural Society, Sept. 10.—The autumnal exhibition was held in the Philosophical Society's Room. The prizes were awarded as follows:—Mr. Heaphy, gr. to Lord Clarina, obtained 9 prizes, namely, for the best bunch of *Green Grapes,* 2d bunch of *Black do.,* 2d dish of *Mixed Grapes,* best dish of *Cherries, Figs, Carrots,* 2d *Onions,* best *Field Turnips,* and *Mangel Wurzel.* Mr. Walsh, gr. to Sir A. de Vere, Bart., obtained 10 prizes, for the best *Nectarines, Seedling Dahlias, Roses,* 2d *Pansies* and *Verbenas,* best 4 *Dark Dahlias,* best 4 *Yellow,* 2d *White* and *Crimson,* and the best 6 *Fúchsias.* Mr. Drury, gr. to Sir H. D. Massy, Bart., obtained 4 prizes, for best *Red Grapes, Mixed do.,* 3d *Peaches,* and best *China Asters.* Mr. Carmody, gr. to W. Monsell, Esq., 9 prizes, for best *Peaches, Pears, Currants, Oranges, Filberts,* and *Mulberries, Mushrooms, Endive, Lettuce,* and *Plums* for size. Mr. Fitzgerald, gr. to G. Tuthill, Esq., 6 prizes, for best *Gooseberries,* 2d *Pears, Red* and *Green Grapes,* best *Red Celery,* and an honorary prize for a large *Pumpkin.* Mr. Collopy, gr. to G. Bevan, Esq., 19 prizes, for the best 4 *Striped Dahlias, Light-coloured do., White do., Crimson do.,* the best and largest *Collection of all Colours,* the best *Single Dahlia,* 2d *Dark* and *Yellow Dahlias,* the best *Ericas, Greenhouse Plants,* and *largest Collection,* the *best Stove Plants, Bouquet of Exotic cut Flowers,* 2d *Fuchsia* and *Hardy Bouquet,* the best *White Celery,* the 2d brace of *Cucumbers, Cape Gooseberry,* and the best *Specimen Plant.* Mr. Gaynor, gr. to Capt. Stackpoole, R.N., 3 prizes, for best *Apples, Broccoli,* the 2d *Collection of Vegetables.* Mr. Mack, gr. to Mrs. Cooper, 4 prizes, for the best *Melon for weight,* 2d *Hardy Annuals,* the best *Collection of Potherbs,* and *separate Collection of Vegetables.* Mr. Grady, gr. to the Mayor of Limerick, 7 prizes, for the best *Plums* and *Baking Apples, Tender Annuals, Cockscombs, Onions,* and *Turnips.* Mr. Lawlor, gr. to G. Vincent, Esq., 5 prizes, for best *Melon for flavour,* 2d *Peaches,* the best *Cal-*

ceolarias, Stocks, and *Parsneps.* Mr. M'Donagh, gr. to W. Lloyd, Esq., 5 prizes, for best *Collection of Pansies,* 2d *Striped Dahlias, Light or Tipped Do.,* the best *Cucumbers.* Mr. Horan, gr. to B. Waller, Esq., 1 prize, for best *Bouquet of Hardy Cut Flowers.* Mr. Kiely, gr. to J. Russell, Esq., 8 prizes, for the best bunch of *Black Grapes, Exotic Tree in bearing,* and *Balsams,* the 2d *Collection of Dahlias, Greenhouse Plants, Pelargoniums,* and largest *Collection of do.,* with the best *Dessert Apples.* Mr. Gardner, gr. to A. Furlong, Esq., 2 prizes, for the best *Beet-root* and *Potatoes.* Mr. Kenny, gr. to P. Gabbett, Esq., a prize for the best *Pineapple.* Mr. Ryan, gr. to F. Bevan, Esq., 2 prizes, for best *Summer Cauliflowers* and *Pinks.* Mr. M'Mahon, gr. to M. Fitt, Esq., 8 prizes, for best 6 *Hardy Annuals,* 2d *Calceolárias,* the best *Pelargoniums* and *largest do.,* 6 *Herbaceous Plants,* 2d *Roses,* best 6 *Verbenas* and *Vegetable Marrow.*

South Essex Horticultural Society, Sept. 8.—The third exhibition took place in Wanstead Park under inauspicious circumstances. The violent thunder-storm on the previous day did partial damage in the neighbourhood; and the rain which succeeded it so contracted the canvas and stay-cords of the Society's large marquee, that notwithstanding all possible care, the immense contracting strain on so large a surface rent the ridge, and rendered it unfit for the purpose of exhibition. The day of exhibition proved equally unfavourable. There were, however, several good collections of plants sent; among which, the 1st prize, Nurserymen's Class, was awarded to Mr. F. Fraser. Gardeners' large Collection, Mr. S. Gad, gr. to T. Lenox, Esq. Best 6 Plants: 1, Mr. J. Kyle, gr. to R. Barclay, Esq.; 2, Mr. S. Allen, gr. to G. Sharpe, Esq. Six Plants: *Amateurs,* 1, Mr. R. Poole; 2, Mr. Mallard. Single Specimen: 1, Mr. F. Fraser; 2, Mr. S. Gad. Ditto: *Amateurs,* Mr. Poole. Ericas, Mr. R. Forster, gr. to Rev. W. Wilson. Treviranas: 1, Mr. Kyle; 2, Mr. S. Gad. Balsams: *very fine,* 1, Mr. B. Daley, gr. to F. R. Redwell, Esq.; 2, Mr. R. Forster. Cockscombs, Mr. J. Monk, gr. to W. W. Drake, Esq. Fuchsias: *Amateurs,* 1, Mr. Mallard; 2, Mr. J. Brock. Globe Amaranthus: 1, Mr. J. Black, gr. to C. T. Holcombe, Esq.; 2, Mr. G. Hatcher, gr. to R. F. Reynolds, Esq. Cut Flowers: 1, Mr. S. Gad; 2, Mr. J. Kyle. German Asters, Mr. S. Allen. French and African Marigolds, Mr. W. House, gr. to W. S. Fry, Esq. Ferns, Mr. J. Pamplin. Orchidaceous Plants, Mr. Crouch, gr. to J. Allcard, Esq. Heartsease: *Gardeners,* 1, Mr. J. Monk; 2, Mr. S. Gad; 3, Mr. B. Daley. 48 Dahlias, Mr. F. Fraser. 36 *do.,* Messrs. F. and A. Smith; 24 *do., Gentlemen's Gardeners,* 1, Mr. J. Carter; 2, Mr. R. Forster; 3, Mr. J. Rule. 12 *do.,* Mr. T. Bailey. 24 *do., Amateurs,* Mr. J. Pells. 12 *do.,* Mr. C. Hipkins. The Seedling Dahlias attracted much attention, and were admired—1841, 1st, *Empress of the Whites,* Mr. G. Smith; also 2d for a fine Yellow, of 1842. Mr. P. Stein received the 1st prize for *seedlings* of 1842; Messrs. F. and A. Smith, 2d and 3d prizes for *seedlings* of 1841. Pines, Mr. J. Reynolds. Grapes: *Black,* 1, Mr. C. Frost, gr. to J. Wheen, Esq.; 2, Mr. J. Rule, gr. to W. Leverton, Esq.; 3, Mr. D. Robertson. Extra Prize, to Mr. J. Loudon, gr. to S. Gurney, Esq.; Mr. J. Kyle, and Mr. W. Dykes. *White,* 1, Mr. J. Black, gr. to C. T. Holcombe, Esq.; 2, Mr. D. Robertson; 3, Mr. J. Loudon. Out-door Grapes: 1, Mr. J. Kyle; 2, Mr. Bailey; 3, Mr. J. Carter, gr. to Mrs. Hall. Peaches, Mr. L. Murray, gr. to C. Tebbutt, Esq.; also 1, for Cherries and Figs. Peaches, 2, Mr. D. Robertson. Nectarines, Mr. D. Robertson. Melon: *Green-fleshed,* 1, Mr. Bailey; 2, Mr. Robertson. *Scarlet,* 1, Mr. L. Frost; 2, Mr. B. Daley; 3, Mr. Bailey. Pears: 1, Mr. J. Rule; 2, Mr. W. Hould. Apples: *Dessert,* 1, Mr. S. Gad; 2, Mr. D. Robertson; 3, Mr. B. Daley. *Kitchen,* 1, Mr. J. Black; 2, Mr. G. Hatcher. Currants: *Red,* 1, Mr. J. Black; 2, Mr. J. Spurgins. Gooseberries: Mr. J. Duck; also 1st for *Cucumbers.* Plums: *Greengage,* 1, Mr. Kyle; 2, Mr. J. Carter. *Any other variety,* 1, Mr. Kyle; 2, Mr. Robertson. Collection of Fruit: 1, Mr. Kyle; 2, Mr. Robertson; 3, Mr. R. Forster. Basket of Vegetables, Mr. S. Allen. Do.: *Amateurs,* 1, Mr. J. Brock; 2, Mr. J. Duck. A variety of Fruit and Vegetables were exhibited by Cottagers, and a number of prizes were awarded. The best productions were from the Cottagers' allotments let by S. Gurney, Esq., Upton.

Wisbeach Horticultural Society.—This exhibition was held on Wednesday last. The following is a list of the flowers that composed the winning stands of Dahlias:—24 *Blooms*—Widnall's Conductor, do. Eclipse, do. Majestic, do. Queen, Hudson's Princess Royal, Dodd's Prince of Wales, Maria, Regina, Phenomenon, Pamplin's Charles XII., Ansell's Unique, Catleugh's Eclipse, Suffolk Hero, Tournament, Andrew Hofer, Metella, Egyptian Prince, Duchess of Richmond, Bridesmaid, Royal Standard, Sir Frederick Johnstone, Indispensable, Lady Cooper, Stella. The *silver cup, value* 5*l.,* Mr. Widnall, of Grantchester. 12 *Blooms*—1st, Grand Tournament, Maria, Nicholas Nickleby, Catleugh's Eclipse, Indispensable, Metella, Grande Baudine, Duchess of Richmond, Attila, Springfield Rival, Stella, Sir Frederick Johnstone—Mr. Widnall. As it had been arranged previously, that no exhibitor should be allowed to receive two prizes, the two sovereigns were given to the 2d stand, exhibited by C. Hunter, Esq., of Downham, for Widnall's Argo, Dodd's Prince of Wales, Egyptian Prince, Suffolk Hero, Maria, Phenomenon, Pamplin's Bloomsbury, Lady Cooper, Optima, Grace Darling, Amato, and Beauty of Wakefield.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Gera'nium eriánthum. Woolly-flowered Geranium. (*Hardy Perennial.*) Geraniáceæ. Monadélphia Decándria.—A robust hardy perennial, of easy culture, growing from one to two feet high, in any good garden soil. It flowers freely during the months of June and July, and is easily increased by dividing the old plant when in a state of rest, or by seeds. The seeds should be sown directly they are ripe, and then they will flower the following season. It was raised in the Garden of the Horticultural Society, from seeds received from North-west America.—*Bot. Reg.*

Onci'dium urophyllum. Tail-leaved Oncidium. (*Stove Epiphyte.*) Orchidáceæ. Gynándria Monándria.—This is really a charming species of Oncidium, with quite a peculiar habit. Its leaves are shaped like a penknife curved backwards, so as to have the edge on the convex side. This is caused by the two sides of the leaf being brought into contact, and then growing together, the back of the knife-shaped leaf consisting of their edges. It bears a graceful drooping panicle of clear yellow flowers, four feet long, almost white at the back, and with a few crimson stains near the centre on the upper side. It was imported from Brazil by Messrs. Loddiges, and flowered with them in March 1841. It requires a damp stove in cultivation, and may be suspended from the rafters in a basket, or on a block of wood, and planted in brown, turfy peat; or it may be grown successfully in a pot if it is well drained. In either case the greatest care must be exercised in watering it, particularly when it commences its growth, for the young shoots at this stage are easily rotted.—*Bot. Reg.*

Small-flowered Shew-cereus. Garden variety. (*Greenhouse Succulent.*)—This is a garden variety of Cactus speciosissimus, or the Shew-Cereus, with smaller flowers than usual; and is pretty, and well worth cultivation. It is a greenhouse plant, requiring the same treatment as the Shew-Cereus itself. Formerly such plants were grown in the poorest soil, such as old lime and brick rubbish; but it is now well known that they do far better in a much richer compost. Equal parts of rich loam, sandy peat, and dung, well mixed together, seem to suit them admirably. The principal point to be attended to in their management is, to supply them freely with water when growing in the summer, and then to place them out in a warm part of the garden in the autumn, fully exposed to the sun. They should be taken into the greenhouse before the weather gets too wet and cold, and kept rather dry during the winter. The present species strikes readily from cuttings treated in the usual way.—*Bot. Reg.*

MISCELLANEOUS.

Vegetation of Affghanistan and Western India.—We extract the following interesting facts from a valuable appendix by Dr. Royle to "Vigne's Travels:"—"The country round Rawil Pindee is open, scattered with single hills and tolerably cultivated, and here Dr. Falconer first met with the famous Zuetoon or wild Olive, an undetermined species of Olea. Further on at Hussun Abdaul, he found Himalayan Rubi, and a white-flowered Kashmir Dianthus; and there Mr. Elphinstone for the last time, in a garden which resembled and almost equalled that of Cohaut, saw the Plane-tree (Platanus orientalis), which forms the favourite ornament of all the gardens of the West. Burnes says, that the Peach and Apricot glowed with blossom, and the Vines clung to their branches. To the westward of the Indus, but encircled by prolongations of the above range of hills, we reach the plain of Cohaut, a circle of about twelve miles in diameter, with hills around, varied and picturesque. The plain was green and well watered, and the climate delightful; the snow never lies long on the lower hills about Cohaut, and the fruits and flowers of all climates are said to be produced in the plain. Mr. Elphinstone especially mentions that the garden, spread along the banks of a crystal stream, afforded them great delight, though perhaps its charms consisted in its abounding in English plants, from which they had been long estranged in the climate of India. It was enclosed by a hedge, full of wild Raspberry and Blackberry bushes, and contained Plum and Peach trees in full blossom (21st February), Weeping Willows and Plane-trees in leaf, together with Apple-trees. The celebrated Bed-i-Mishk was also here; and Mr. Elphinstone was surprised to find it was a sort of Willow, with yellow sweet-scented flowers like the Palm Willow in Great Britain. It is probably the Salix ægyptiaca. There were also numerous Vines, as thick as a man's leg, twisted round the trees as if they were wild. The walks were covered with green sod, which looked the more English, because some withered grass was seen among the full, soft, and fresh verdure of the new year. There was also Clover, Chickweed, Plantain, Rib-grass, Dandelion, common Dock, and many other English weeds. The plain in which the city of Peshawur is situated is surrounded by mountains, and watered by several streams fringed with Willows and Tamarisks. In March the upper parts of the mountains were covered with snow, while the plain was clothed with the richest verdure, and the climate was delicious. The orchards scattered over the country contained a profusion of Plum, Peach, Apple, Pear, Quince, and Pomegranate trees, which displayed a freshness and brilliancy never seen in the perpetual summer of India. The uncultivated parts of the land were covered with thick elastic sod, that perhaps never was equalled but in England. The greater part of the plain was highly cultivated, and the trees were chiefly Mulberries, or other fruit trees, but Oranges are rare. Except a few picturesque groups of Dates, the only tall trees were the Ficus religiosa or Peepul, and the Tamarisk, which last grows here to the height of thirty or forty feet. The Cypress is a frequent ornament of the gardens, as well as the Plane-tree or Chinar, each attaining to the height of one hundred feet. The Lombardy Poplar, which is so often mistaken for the Cypress, in drawings of these regions, is also cultivated here. Roses, red, white, yellow, and China, are mentioned as being profusely abundant, with Anemones, Poppies, and stately rows of alternate Cypresses and Planes. Thyme and Violets perfumed the air, and the green sod and clover put them in mind of a distant country. In the march from Peshawur, the plant called Jouz by the Affghans, and Khauree Shooturee by the Persians (probably Alhagi Maurorum), and a plant very common about Peshawur, which much resembles that in English gardens called Devil-in-the-bush;—no doubt a species of Nigella, and probably its seed is the Siah Dana used for flavouring dishes, and which is generally considered to be the Black Cumin of Scripture. Though we have no precise information respecting the vegetation of Affghanistan, yet there is no doubt, from the cold and dry nature of the climate, there must be a disappearance of tropical, and an approach to the vegetation of more northern latitudes, as of the Persian and Mediterranean, with a few plants probably of the African region. The seeds of plants collected by Mr. Griffith, and sent to the India House, belonged entirely to such genera as Aconitum, Papaver, Thlaspi, Cheiranthus, Cochleária, Cardámine, Sisýmbrium, Silene, Arenária, Ruta, Peganum, Epilóbium, Campánula, Heliotrópium, Onosma, Pedicularis, Linária, Verónica, Hyoscyamus, Verbascum, Plantago, Sámolus, Hippophae, Rumex, Polýgonum, Euphórbia, Phyllanthus, Blitum, Iris, Túlipa, Tauschéria, a Siberian and Tibetian genus, with a Rose and the Hawthorn, Leguminous seeds allied to Astrágalus and Caragana, as well as several Compositæ of the tribe Carduáceæ, with species of Onopordum, Centaúrea and Cichórium. The Prangos Pabularia was also met with, but, Dr. Falconer says, 'nowhere prized as a valuable fodder, or regarded an an agricultural object of any interest.' The climate of Herat is not so severe as that of England, with but moderate snow; the summer months hot, with but little rain except in winter and early spring. The principal trees in the valley are the Elm, the Ash, the Fir, the Plane, the Poplar, the Willow, and the Cypress. Of fruit trees there are the Pear, Apple, Quince, Peach, Apricot, Plum, Cherry (sour), Mulberry (red and white), Pomegranate, Walnut, Filbert, Barberry, and Fig; the Pistachio flourishes in the district immediately north of the valley. Of Melons and Grapes there are every variety in perfection. The vegetables of Herat are Cucumbers, Beet, Onions, Lettuce, Brinjall (Egg-apple), Carrots, Turnips, Spinach, and Beans; all, except the three first named, of very indifferent quality. Among the flowers, the Rose, Jessamine, Lilac, Tulip, Narcissus, Iris, &c., are mentioned, with many of the most common weeds of European countries."

Gardener's and Farmer's Foreign Library.—Mittheilungen. Proceedings of the Agricultural Association in Hanover. Hanover, 8vo.——Winkelblech, C.:—Theorie. Liebig's Theory of Vegetable Nutrition and Schleiden's Objections, discussed. Cassel, 8vo.——Ehrenberg, C. G.:—Leben. The Invisibly Active Organic Life. Berlin, 8vo, with a plate.——Siebold, T. F.:—Flora Japonica. 1st Section, Useful or Ornamental Plants, described by J. G. Zuccarini. 1st Hundred. Leipzig, fol., with coloured plates.

Effects of Gas-liquor on Grass.—The following are the results of experiments made by Mr. Wilson, of Largs (co. of Ayr), in 1841, and communicated by him to the Philosophical Society of Glasgow. A piece of three-years-old pasture, of uniform quality, was divided into ten lots of twenty perches each, old Scotch measure, which being treated as follows, produced respectively the quantities of well-made hay marked opposite each. The value of each application was the same, viz. 5*s.*, or at the rate of 2*l.* per acre. All were applied at the same time, viz. April 15th, and the grass cut and made into hay in July following:—

Lot.	Produce per Lot. Pounds.	Rate per Acre. Pounds.	Increase per Acre. Pounds.
1. Left untouched	420	3360	——
2. 2½ barrels of quicklime added	602	4816	1456
3. 20 cwt. of lime from gas-works	651	5208	1848
4. 4½ cwt. of wood charcoal powder	665	5320	1960
5. Two bushels of bone-dust	693	5544	2184
6. 18 pounds of nitrate of potash	742	5936	2576
7. 20 pounds of nitrate of soda	784	6272	2912
8. 2½ bolls (10 bushels) of soot	819	6552	3192
9. 28 lbs. of sulphate of ammonia	874	6776	3416
10. 100 gallons of ammoniacal liquor from gas-works, at 5° of Tweddel's hydrometer	945	7560	4200

—*Bath Chronicle.*

M. Hartweg.—Letters dated Quito, the 25th May, have been received from this excellent collector by the Horticultural Society. He had been examining all the snow-covered mountains in the neighbourhood, and had formed a valuable collection of bulbs and seeds. His next object was to be the investigation of the warmer districts, from 6,000 to 9,500 feet above the level of the sea. In a month he intended to leave for Popayan, a rich country hardly known to botanists, and 108 leagues distant.

THE NATURALIST'S CORNER.—No. I.

1. **Sunflower,** *Helianthus annuus,* a native of Mexico, is said to trace with its radiant corolla the march of the sun, an idea maintained by many writers. Moore, in his "Irish Melodies," says,

> "As the Sunflower turns to her god, when he sets,
> The same look which she turn'd when he rose.

Thomson, in his "Seasons," and Langhorne, in his "Fables of Flora," entertain the same popular notion; and Sir J. E. Smith states, "Its stem is compressed in some degree to facilitate the movement of the flower, which, after following the sun all day, returns after sunset to the east, by its natural elasticity, to meet his beams."—*Introduction to Botany,* p. 209. But the slightest observation of this plant will show that it does not possess this wonderful property. Gerard detected the error even so long ago as 1597.—*Herbal,* p. 614. See *Drummond's Steps to Botany,* ch. 6.

2. **The Willow** from the earliest times has been dedicated to grief and sadness:

> "I'll wear a Willow-garland for his sake."—*Henry VI.*

Old Fuller calls it "a sad tree, whereof such who have lost their love make their mourning garlands; and we know that exiles hang up their harps upon such doleful supporters. This tree delighteth in moist places, and is triumphant in the Isle of Ely; it groweth incredibly fast, it being a by-word in this country, that the profit of Willows will buy the owner a horse before that by other trees will pay for his saddle."

> "To name the uses of the Willow tribes
> Were endless task. The basket's various forms,
> For various purposes of household thrift;
> The wicker chair, of size and shape antique;
> The rocking couch of sleeping infancy;
> These, with unnumber'd other forms and kinds,
> Give bread to hands unfit for other work."—*Grahame.*

3. **Botanists** should be particularly on their guard against being misled by the colours of flowers. *Nimiùm ne crede colori,* was the maxim of Linnæus; and in judging of species, colour, in which the florist prides himself, ought, in a great measure, to be disregarded. Were this and other trivial points in Botany attended to, several modern authors would not so frequently convert varieties into species, and species into genera. Such needless changes in Natural History, as multiply synonyms, are always to be deprecated.

4. **The Mignonette,** *Reseda odorata,* now naturalised to our climate, is a native of Barbary. Many years since it was introduced to the South of France, where it was welcomed by the name of Mignonette—Little Darling. This favourite plant, brought to England in 1742, is noticed by Cowper, in his "Task:"—

> "——— The sashes fronted with a range
> Of Orange, Myrtle, or the fragrant weed,
> The Frenchman's Darling."

Sir Walter Scott was in error when he introduced it into his novel, "The Fortunes of Nigel," as decorating the London windows during the reign of James I.

5. How many discoveries have been owing to the instincts and flights of the winged tribes! Columbus, when on the wide ocean, became confident that he was approaching the New World, when he discovered the flight of birds proceeding from one island to another. Villages in airy situa-

tions have not unfrequently owed the discovery of a well to gnats hovering over the vapour of a concealed spring; and many a traveller has been enabled, by the flight of a bee, to discover the honey concealed in the bosom of the forest.—*St. Pierre.*

(To be continued.)

GARDEN MEMORANDA.

Henderson's Nursery, Pineapple Place.—In the stove we observed several plants of Allamanda cathártica in flower, which had only been struck last season; this, we believe, is of rare occurrence, as they seldom flower until they have made several years' growth. Here also were in bloom the pretty Angelónia grandiflora, diffusing a fragrance resembling that of a fully-ripened Pine-apple; Costus nepalensis, bearing corymbs of white flowers half enveloped in crimson sheaths; Gardénia Rothmanni, a shy blooming plant, with spotted and exquisitely fragrant flowers; and a species of Gesnera, called G. Múrkii, from the Continent, which bears considerable resemblance to G. splendens in the colour and form of the blossoms, but differs from that and other kinds in producing them in crowded racemes. Ipomœa Learii and I. Hardingii continue to flower freely; the former is trained along the roof, which it has nearly covered, and the latter is led around the curb-stone of the pit in the centre of the house. Pergulária odoratíssima, twining amongst other plants, is putting forth clusters of its pendent sweet-scented flowers. Several plants of Aphelandra cristata are just coming into bloom; this, when well grown, is certainly a valuable acquisition to the stove, as the large masses of its scarlet flowers contrast well with almost every plant near which it may be placed. The elegant foliage and conspicuous crimson stamens of Acácia Kermesina also render it a desirable object. We were much struck with the large size of the foliage of Hibiscus macrophyllus; one leaf upon a young plant, about 2 ft. high, measuring not less than 15 in. in width, and the same in length: this, however, was not in bloom. The Orchidaceous plants in blossom consist principally of Blétia verecunda, bearing an abundance of delicate purple flowers; Catasetum deltoídeum, a most singular plant, with blossoms of a dull green, covered with numerous purplish brown spots, and having a triangular lábellum, from the top of which a yellowish horn protrudes; the whole resembling a group of loathsome reptiles: Trichopília tórtilis, remarkable for its twisted perianth and involute white labellum, spotted with dull red; Oncídium Harrisonianum, a delicate and free-flowering species; and Zygopétalum intermédium. We noticed several healthy plants of Cypripédium venustum and insigne; some of the latter showing signs of flowering. It is found that Camarotis purpúrea, and many other Orchidaceous plants, will not thrive if potted in the ordinary way; but when placed upon a block of wood, with their roots enveloped in moss, that they almost immediately commence growing. The roots of Epidendrum bicornutum rotted off directly they came in contact with the soil; but no such incident occurred when the plant was fixed upon wood. It is, perhaps, not generally known that the wire-handles by means of which the baskets are suspended from the roof act injuriously if they approach too near the leaves. The moisture of the atmosphere condenses upon the iron wires, and falling in drops upon the pseudo-bulbs, not unfrequently occasions their destruction; this might probably be prevented by giving the wires a coat of paint. Several plants of Dendróbium cucullatum, upon blocks of wood, have grown two feet in length since the spring. Here also we saw Drósera rotundifólia thriving admirably in peat, the surface being covered with moss to prevent evaporation. The Heath-house is gay with many species of that interesting tribe; amongst which Erica Aitoniana, with slender white and red tubes; E. verticillata, with whorls of brilliant scarlet; E. palustris, a most abundant bloomer, and of peculiarly delicate habit; and E. grandinosa, with white hail-like blossoms, are most conspicuous. In this house is a luxuriant plant of Lucúlia gratissima, which promises to be highly ornamental during the winter months. The stock of Heaths in the pits is very extensive and in excellent condition. In one of the houses we observed Hibiscus Mánihot, with palmated leaves and large sulphur-coloured flowers, having a dark centre; a remarkably fine plant of Æschynanthus grandiflorus, covered with clusters of rich scarlet and orange; Ipomœa Learii, blooming profusely in 24-sized pots, with the stems closely confined to a circular trellis, about three feet high; and a large plant of Manéttia splendens, a new species, which grows luxuriantly, but has not yet bloomed. Amongst the border-flowers were a brilliant crimson variety of Phlox Drummondii, almost approaching to scarlet; and two varieties of Verbena well worthy of notice—namely, V. Ingrami, rose, with a dark-red centre, and deep green foliage, of good habit; and V. versícolor, a delicate looking flower, of a clear salmon colour.—*R. A., Sept.* 12.

F. A. Phillips, Esq., Thornfield, near Stockport.—The Pineapple is cultivated at this place with great success. A few days since an Enville, weighing eight pounds, was cut from a sucker of last year, being 14 inches long, and 20½ inches in circumference. Extremely fine fruit are also obtained from suckers growing upon the old plant. In October 1840, a Montserrat, of 5 lbs. 3 oz. weight, was cut; a fruit, weighing 5 lbs., was produced by the same plant in August 1841; and in July 1842, another weighing 7 lbs. 2oz. The total weight of 16 Montserrats, cut this season, has been 80 lbs.! There are now to be seen twelve suckers in fruit upon the old plants, being the second within twelve months, whose united weight is estimated at 60 lbs.—*Sept.* 10.

Review.

Paul and Son's Catalogue of Roses for the Autumn of 1842, *and spring of* 1843.

THIS is a priced list of the collection of Roses, cultivated in the Cheshunt Nurseries; in which the different varieties are classed according to their habit of growth, or period of blooming. Many of the old and less valuable sorts are discarded from the present list, and some new ones, principal autumn bloomers, substituted in their stead. In addition to the list of names, each page is divided into columns, indicating the form, size, and fulness of petal, possessed by each flower. We are of opinion, however, that one thing is wanting in this, as well as in every other catalogue of the kind which we have seen; and that is, some distinctive mark between those Roses which are fragrant and those which are not. Such an addition would add greatly to the value of the Catalogue.

CALENDAR OF OPERATIONS *for the ensuing week.*

LEONOTIS Leonurus has been several times noticed in this publication, and some rather troublesome and expensive directions have been given for its culture in pots. We have just seen some noble specimens of this fine autumnal plant growing in the open ground, which have had no other care than that usually bestowed upon plants turned out of pots. Last summer they grew in the same situation, and in autumn they were potted, and preserved through the winter in a conservatory. In spring they were again planted out, and are now profusely covered with whorls of rich red blossoms. Strong plants to put out in spring, and a warm situation to encourage their growth afterwards, appear to be all that is required to bloom the Leonotis in high perfection in the open ground. We mention this, because at this period of the year, when the gaiety of the flower-garden is chiefly derived from Dahlias, Asters, Phloxes, and a few other late-flowering herbaceous plants, the addition to its beauty of a strikingly handsome plant like the Leonotis is of some importance.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—Occasional fires will now be necessary to all the houses, but especially where fruit is swelling off or ripening. Its application must of course be governed by the state of the weather, and by the temperature of the bark-bed. If this still retains a strong heat, and the thermometer in the house indicates 65°, or upwards, in the mornings, artificial heat will be better dispensed with; but if the temperature of the bed is found to be falling rapidly, which will probably now be the case where a small quantity only of fresh tan was added at potting time, slight nightly fires, and occasional waterings of the surface, will be required to restore and prolong it. Vessels of water on the heating apparatus must not be forgotten when fires are made. Be moderate in giving air now, and always shut the houses up warm. Plants become drawn more through want of light (that is, through being set at too great a distance from the glass) than from want of air. Water in small quantities will be frequently required by growing plants; and if there is not a tank in the house, the chill should be taken off by other means.

VINERY.—The pruning of Vines intended for very early forcing ought not to be longer delayed. In consequence of neglect in this particular, we have known Vines break in autumn before they were pruned. A kind of scale (Coccus vitis) is frequently troublesome in Vineries, by dirtying and thereby disfiguring the fruit. We have in vain tried to destroy it by a thick wash of lime and sulphur: possibly a solution of glue, laid on with a brush after peeling the old wood, would be more efficacious.

PEACH-HOUSE.—If not yet done, let the sashes be repaired, washed, and painted, in readiness for putting on the house before cold wet weather sets in. The pruning and tieing of the trees, and the top-dressing of the borders in the house, might stand over till a wet day after the lights are put on. Attend to the trees in the late house as before, till the wood is perfectly matured.

CHERRY-TREES in pots and tubs ought to be prepared for forcing by taking off the surface soil and replacing it with fresh nutritious compost. These trees do not generally need much pruning, but it will be advisable to look over them and remove any useless shoots.

CUCUMBERS AND MELONS.—Let growing plants be kept warm as directed last week. In ridging out Cucumber plants for pit culture, take care that the soil is rough and porous. Different eminent growers recommend different composts. One that is generally accessible, and in which Cucumber plants will thrive well, is good turfy loam mixed with about a third part of leaf-mould, adding a little sand if the loam be naturally heavy. A trellis for training the shoots upon will be found much preferable to allowing them to trail over the damp earth. Plants in pots in the Pine-stove should be dewed over the foliage when the house is closed.

Out-door Department.

GREEN HERBS are in some places required in the depth of winter; some plants of everything likely to be in demand, should therefore, be potted in readiness for removal at any time to a warm house. Parsley roots might be planted in boxes, or in the border of a forcing house, and Chervil might be sown in boxes. A few pots of Sweet Basil should likewise be sown.

BROCCOLI.—Continue the removal of the extra plants. Some of the latest sorts might be put on a north border; in which situation their flowering will be retarded a week or ten days in spring.

CABBAGES.—Plant from the August sowing. The smallest plants should be pricked out into nursery beds, to be transplanted in spring.

CAULIFLOWERS.—If the plants sown in the end of August have come up thickly, the largest of them should be pricked out to strengthen, previously to their removal to winter quarters.

CELERY.—Earth up in succession a sufficiency for winter consumption. That meant for spring use need not be meddled with till next month, when on a dry day it may be finally earthed at once.

LETTUCE.—If the weather should continue open during the autumn months, the Lettuces sown in the middle of August will become too large and succulent to bear the frosts and cutting winds of early spring; it will therefore be proper to make another sowing, either on a dry and sheltered border, or under the protection of a frame. As these must furnish the table till the produce of the first spring sowing comes in, sorts of proved merit should be selected.

SPINACH.—Thin the growing crops.

SUCCORY.—Thin the last sown plants, and encourage their growth by occasionally hoeing among them.

Orchard.—Gather Apples and Pears as they ripen, bearing in mind that Pears which keep only a few weeks should not be too ripe when gathered, or they will become mealy. As wall-fruit is now getting more scarce, extra pains will be necessary to preserve Golden Drops, Imperatrice, and other late Plums, from wasps and flies. Continue to shift Strawberry plants into their fruiting pots. If an insufficient number has been prepared, some strong runners from the open ground may be planted, three in a pot, for the latest crop.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Any young Mammillárias, or plants of that kind, which have been in dung frames during the summer, must now be taken back to the stove and kept rather dry, unless the weather is very bright. Attend particularly to the pruning and training of climbing plants. Light fires in the warmest Orchidaceous house during cold days, but allow them to go out in the evening; it is always better to have the temperature considerably lower at night than in the day.

GREENHOUSE AND CONSERVATORY.—Continue the transfer of Greenhouse plants to the house, where, if handsome specimens are desired, they must be allowed plenty of room to extend their branches on all sides without interference with each other. Some persons spoil all their plants by attempting to grow a greater number than they have proper accommodation for in winter. Set Pelargoniums near the glass, and, where a difference can be made, let Heaths occupy the most airy part of the house.

PITS AND FRAMES.—The Chrysanthemums which were struck from cuttings in summer and planted out, should now be taken up and potted. Retain plenty of roots, and put them into rich soil; they should afterwards be set in a shady place, and have the foliage frequently moistened till they get root-hold. All shrubs intended for early forcing ought to be prepared for that purpose, either by re-potting or by top-dressing. In pruning Roses for forcing, the young wood should not be too much shortened. China Roses will now propagate readily from cuttings. Thin the annuals which have been sown in pots. If this sowing has been neglected, it may yet be made.

Out-door Department.

If any choice plants, which it is desired to preserve, have been turned out into the flower-garden, they should now be taken up and potted; but do not yet disturb beds of Pelargoniums, or destroy the beauty of the mixed clumps by taking too many plants away from them. To prolong the gaiety of the flower-garden, such things should be left out till they are in actual danger from frost; or, if plenty of cuttings have been put in, as advised, many of the plants may remain to perish. Let Dahlias be properly numbered, and the list of the colours, height, and other properties, corrected, while the flowers are in perfection.

NURSERY AND FOREST DEPARTMENT.

NURSERY.—Rooted layers of evergreens may now be taken off and planted in rows. Those of deciduous trees had better remain on till the fall of the leaf. Seedling evergreens which stand too thick in the seed-beds may also be thinned out and planted.

FOREST AND COPPICE WOODS.—Finish the planting of evergreens intended for game cover, screens, &c., before the season arrives for the removal of deciduous trees, for which every necessary preparation in the way of trenching, &c., ought immediately to be made, if it has not yet been done.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending Sept. 15, 1842, as observed at the Horticultural Garden, Chiswick.

Sept.	Barometer.		Thermometer.			Wind.	Rain.
	Max.	Min.	Max.	Min.	Mean.		
Friday 9	29.597	29.427	66	53	59.5	S.W.	.06
Saturday 10	29.577	29.385	66	51	58.5	W.	.07

The highest temperature during the above period occurred on the 24th, in 1832—thermometer 81°; and the lowest on the 21st, in 1836—thermometer 32°.

REPORT ON COVENT GARDEN MARKET,

For the week ending Sept. 16, 1842.

THE market has been well supplied with Fruit and Vegetables during the past week; but trade has been far from brisk. *Fruit:* Pines are tolerably plentiful, and many handsome fruit are offered, from 4*s.* to 6*s.* per lb. The price of Grapes is on the decline; Black Hamburghs are selling from 1*s.* to 2*s.* 6*d.* per lb., and Muscats from 2*s.* to 3*s.* per lb. English Melons continue from 1*s.* to 3*s.* each: but plenty of the Dutch may be obtained from 9*d.* to 1*s.* The earlier kinds of Peaches and Nectarines having passed away, the late sorts have become more valuable, and the best fruit is selling at 6*s.* per doz. Few Greengages are to be met with, and the supply of Dessert Plums is chiefly confined to Coe's Golden Drop, the price of which is 1*s.* per punnet. Damsons, if anything, are cheaper than in our last report. Figs have fallen to 1*s.* and 1*s.* 6*d.* per doz. Apples and Pears remain at nearly the same prices as stated last week: Gansell's Bergamot has become more plentiful, and fetches from 4*s.* to 6*s.* per half-sieve; a few samples of Marie Louise have also appeared, which are far from being ripe, at 5*s.* per half-sieve. Walnuts, chiefly from abroad, are selling from 1*s.* to 1*s.* 6*d.* per 100; and Filberts from 9*d.* to 1*s.* per lb. Good Cucumbers are somewhat dearer, the frame fruit selling from 4*s.* to 6*s.* per doz. *Vegetables*: Cauliflowers are small, and continue to fetch from 4*s.* to 6*s.* per doz. Broccoli is tolerably plentiful, from 6*d.* to 1*s.* 3*d.* per bunch. The late showers have improved the quality of Turnips, which are abundant, from 1*s.* 6*d.* to 2*s.* 6*d.* per doz. bunches. Artichokes are becoming scarce, and fetch from 3*s.* to 5*s.* per doz. The prices of other Vegetables have varied little since our last account. Truffles may be obtained at 2s. 6*d.* per lb. *Flowers:* Amongst the cut Flowers we observed Angelónia pubescens, Pergulária odoratíssima, Bignónia venusta, with Violets, Lobélias, Gardénias, Amaryllises, and Clematises.

PRICES, SATURDAY, SEPT. 17, 1842.—FRUITS:—

Pine Apple, per lb. 4*s* to 6*s*
Grapes, per pound, 1*s* to 2*s* 6*d*
— Muscats, per pound, 2*s* to 3*s*
— Portugal 1*s* to 2*s*
Melons, English, each, 1*s* to 3*s*
— Dutch, 9*d* to 1*s*
Peaches, per doz. 3*s* to 6*s*
Nectarines, per doz., 3*s* to 6*s*
Figs, per doz., 1*s* to 1*s* 6*d*
Plums, dessert, per punnet, 1*s*
Damsons, per hf. sieve, 2*s* to 3*s*
Greengages, per punnet, 1*s* 6*d* to 2*s* 6*d*
— Baking, per hf.-siv. 5*s* to 8*s*
Apples, dessert, per bush., 2*s* 6*d* to 6*s*
— Kitchen, 2*s* to 6*s*;

Pears, dessert, per hf.-sieve, 2*s* to 6*s*
Berberries, per hf.-sieve, 3*s*
Mulberries, per gallon, 9*d* to 1*s*
Cucumbers, per doz., 1*s* to 6*s*
Oranges, per doz., 1*s* to 3*s*
— per 100, 6*s* to 20*s*
Lemons, per doz. 1*s* 3*d* to 3*s*
— per 100, 10*s* to 24*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 3*s*
Filberts, English, per 100 lbs. 55*s* to 70*s*
Walnuts, per bushel, 12*s* to 24*s*
Nuts, per bushel—
— Brazil, 20*s*
— Barcelona, 24*s*

VEGETABLES.

Cabbage, per doz. 6*d* to 1*s* 6*d*
— plants, per doz. 1*s* to 2*s*
— Red, for pickling, 2*s* to 3*s* 6*d*
Broccoli, per bunch, 6*d* to 1*s* 3*d*
Cauliflowers, per doz., 4*s* to 6*s*
Beans, Kidney, per hf. sv., 1*s* 6*d* to 3*s* 6*d*
— Scarlet, per hf.-sv. 1*s* 6*d* to 2*s*
Potatoes, per ton, 45*s* to 80*s*
— per cwt. 2*s* 6*d* to 4*s*
— per bushel, 1*s* 6*d* to 2*s* 6*d*
— Kidney, per bu., 2*s* to 2*s* 6*d*
Artichokes, per doz., 3*s* to 5*s*
Turnips, per doz bun., 1*s* 6*d* to 2*s* 6*d*
Carrots, per doz. bun., 3*s* to 5*s*
Red Beet, per dozen, 9*d* to 1*s*
Parsneps, per bunch, 6*d*
Horse Radish, per bundle, 1*s* 6*d* to 5*s*
Radish, per doz. hands (24 to 30 each) 9*d* to 1*s*
— Turnip, p. doz. bch., 9*d* to 1*s*
Spinach, per sieve, 1*s* 6*d* to 2*s*
Leeks, per doz. bun., 1*s* 6*d* to 2*s*
Shallots, per lb., 8*d* to 1*s*

Onions, per doz. bch., 2*s* 6*d* to 5*s*
— Green, p. doz. bun. 2*s* to 4*s*
— Spanish, per doz. 2*s* to 6*s*
— for Pickling, per hf.-sv. 2*s* to 3*s*
Garlic, per lb. 4*d* to 8*d*
Lettuce, Cabbage, p. sc., 1*s* to 1*s* 3*d*
— Cos, 9*d* to 1*s* 6*d*
Endive, per score, 1*s* 3*d* to 1*s* 6*d*
Celery, per bd., (12 to 15), 6*d* to 2*s*
Small Salads, per punnet, 2*d* to 3*d*
Watercress, per doz. sm. bun. 4*d* to 6*d*
Parsley, per doz. bun., 1*s* 6*d* to 2*s* 6*d*
Tarragon, per doz. bun., 2*s* to 3*s*
Mint, per doz. bunches, 2*s*
Basil, per doz. bunches, 2*s* to 4*s*
Vegetable Marrow, per doz., 6*d* to 9*d*
Tomatoes, per hf. sv. 1*s* 6*d* to 3*s*
Capsicums, green, per 100, 9*d* to 1*s* 6*d*
— Ripe, 3*s* to 6*s*
Mushrooms, per pottle, 9*d* to 1*s* 3*d*
— Field, per bus., 3*s* to 3*s* 6*d*
Truffles, per pound, 2*s* 6*d*

Notices to Correspondents.

A Correspondent is informed by Mr. F. Davies, of Pershore, that the LARGEST CELERY which he ever saw was grown by Gen. Marriott's gardener, at Avon Bank, from plants raised by himself in February 1839, three of which weighed respectively 17¾lbs., 12½lbs., and 12lbs., the total weight of the three heads being 42lbs. They took a prize at the Evesham Vale Horticultural Society in Sept. 1839. Mr. Davies states that he has heard of much larger having been grown in the neighbourhood of Manchester.—‡

A Constant Reader's specimen is the Strawberry Blite.—‡

T. R. P.—You will find NEWMAN'S BOOK ON FERNS useful in ascertaining the native species.—‡

Autumnalis.—The Ligustrum lúcidum, or CHINESE PRIVET, may be easily propagated by layers; if cut down in the spring, it will not flower the same year. It will grow in the shade, but will succeed better if planted in a situation exposed to the sun.—‡

Alpine.—Your specimens were much crushed; but they appear to be Ipomœa pes tígridis and Erinus hispánicus.—†

Sudbury.—The quantity of NITRATE OF SODA that may be applied per acre upon light land is ¾ cwt. or 1½ cwt. We do not know whether it has ever been applied to Cucumbers; if used for such a purpose, it should be in small quantities, until it is ascertained whether it acts beneficially upon them or not.—‡

An Original Subscriber.—We would recommend you to take up your CARROTS before they form fresh fibres; if allowed to remain, they will neither be so sweet, nor keep so well after, although they may increase in size. Many of them, upon making a second growth, will probably run to seed.—‡

A Subscriber.—Your plants are—1, Tradescántia virgínica rubra

2, Silene arméria, with white flowers; 3, Phyteuma campanuloides; 4, a Solidago; 5, Lopézia coronata.—‡

A. B.—Normandy Cress is the same as the American Cress mentioned in Loudon's "Encyclopædia of Gardening." It should be sown about the middle of August, to stand the winter; another sowing should be made early in spring, and then again at intervals every three weeks or a month during the summer. The young plants should be thinned to two inches apart, and the larger leaves only should be gathered separately for use. The quantity of Guano which may be mixed with earth for dressing Grass land must depend on its strength, which is very variable. Two cwt. per acre should be sufficient.—‡ †.

A. Kenrick.—The *Oncidium* is only flexuosum; but the leaf sent does not belong to it. The Stanhopea is a variety of S. Wardii, which is itself a variety of S. oculata.—†

Flora had better read Lindley's "Elements of Botany" first, and then the "Natural System of Botany" of the same author, if she wishes to *understand* the natural arrangement of plants. If her object is merely to amuse herself, then "Lady's Botany," of which there is a cheap abridgment, is the book for her.—†

A Constant Reader.—If the Wireworm be the "Grub-worm" alluded to, we know of no better modes of getting rid of it in a *garden* than those with which our correspondent seems to be well acquainted. As regards their ravages in the *field*, it is too extensive a subject, we fear, to form one article in the columns of the *Gardeners' Chronicle*; but it will be fully discussed next year in the Journal of the Royal Agricultural Society.—*R.*

A Learner.—M'Intosh's Practical Gardener is the best work upon the cultivation of Pines, Grapes, &c. We intend shortly to publish a series of papers upon the treatment of Orchidaceous plants.—†

H. H.—Your specimens are—1, Lámium purpúreum; 2, Mentha arvensis; 3, Mentha géntilis.—‡

F. H. S.—We are of opinion that the bleeding caused by the removal of the partially-formed fruit from Fig-trees will not prove injurious; as the wounds will soon heal over, and the bleeding will cease.—‡

H. T.—For practical purposes, we consider the situation of the Thermometer at Chiswick to be highly proper. The price of a Rain Gauge is about 50*s.*—‡

G. R.—We should imagine that your Black Esperione Vine is not true, by your stating that some of the berries are not at all coloured, while others upon the same branches are quite ripe. In such a season as this, the Black Esperione ought to ripen thoroughly on the open wall.—‡

S. B.—The plant with which your lawn is studded is the Plantain or Rib-grass. To destroy it, the leaves should be cut off below the soil as often as they make their appearance. Where the clusters do not stand too thick, a pinch of salt applied to the injured crown would assist in killing the root; but where these are numerous, this remedy is dangerous, as the quantity of salt used would necessarily injure other adjoining plants. The compost which you have prepared, and which consists of 8 loads of horse manure, 12 loads of bog earth, and 6 loads of night soil, is too good to be given to Laurels and evergreens. If you do use it for that purpose, it should be applied in winter, and in very small quantities; otherwise it will cause the shrubs to grow too luxuriantly, and the consequence will be that the wood will not ripen sufficiently to withstand the winter.—‡

P. T.—The best way of using sulphate of iron in fixing the ammonia of manure, is to scatter it in the form of powder among the litter as the heap is made up, and to keep watering the heap as it advances. But care must be taken to return to the heap all that flows away from it, so that the whole of the fluid is soaked up. It is impracticable to say how much of this vitriol should be employed; enough has been used when no more ammonia is disengaged; you may ascertain this by dipping a rag in muriatic acid and holding it over the surface of the manure: if white fumes form round the rag, the ammonia is flying away, and more of the sulphate of iron is wanted; if no white fumes appear, there is enough. The following hardy plants will serve to keep your American border gay during summer: Lythrum virgatum, Pentstemon gentianoides, P. gent. coccínea, Chelone barbata, Delphinium grandiflorum, Gaulthéria procumbens, Clématis integrifólia, Gentiana saponária, Dracocéphalum speciosum, Menziésia polifólia alba, Phlox cárnea, P. Thompsoniana, P. omniflora, Yucca filamentosa, Y. gloriosa, and Potentilla Hopwoodiana. You should add a greater portion of loam than peat to your Rose border: if the loam is *good*, little manure of any kind will be required. The following are 12 good China Roses: Fabvier, Cramoisie supérieure, L'Infidélité de Lisette, Henry the Fifth, Napoleon, Theresa Stravius, Paris, Miellez, Clara Sylvain, Mrs. Bosanquet, Eugene Beauharnais, and Archduke Charles.—† ‡

A Friend.—It will cost between 3*l.* and 4*l.* for every 16 pages to print 500 copies of an octavo book; besides which there are many other heavy expenses, especially that of advertising. The cost will, however, depend much upon the size of the type. There is no good book on the details of foresting, but plenty of bad ones. But there are some useful general directions upon the subject in West's book on the mismanagement of plantations, and in Mr. Withers' book on the Acacia, both of which have been lately advertised in our columns. You will find all the information you want upon measuring heights above the sea, by referring to the article "Heights," in the "Penny Cyclopædia," which you can get for one penny. To give you the information in this place, would occupy more room than we can spare.—†

Mr. Girling.—The dark-shaded Dahlia is a flower of good form, with the centre well up, and the petals finely developed; the petals are of a good shape and substance, but too small for a show-flower; the colour is rich, and the flower neat and compact. *The lilac* is too small, and inferior to most of the varieties in cultivation of the same colour.—*

Gamma.—L'Enfant d'Ajaccio is a very pretty Rose, well formed, and of a good colour; the outer rows of petals are beautifully formed.—*

H. C., Kensington.—We believe your Rose is a variety named Fénélon.—*

Z. Z.—Your plant is Lycopsis arvensis.—‡

C. D.—Your Calceolárias are infested with Thrips. The most effectual remedy towards destroying them is to dust the leaves, especially the under surfaces, with flowers of sulphur. After this has been allowed to remain upon them for a few days, the plants should be syringed with pure water. A slight application of sulphur should always be resorted to as soon as the insect makes its appearance.—‡

An Amateur will not injure his Asparagus beds by dressing them with guano in the manner recommended for night soil; although three or four inches of the former is rather a large dose. The proper time for eating the Portugal Cabbage is in the autumn. It should be sown early in spring, and planted out in the same manner as the common Cabbage; by which means it will be fit for use in the present month. As it is impatient of cold, the great object is to have it full-grown before frost commences.—‡

A Constant Reader.—We do not think it would be advisable at this period of the year to remove the small fry of Gold-Fish from the pond in which they are bred. As the spring advances, some of them should be removed, if the number bred is greater than the pond can support. No doubt Seedling Oaks and Spanish Chesnuts, if untransplanted, will produce laterals; and in some cases the latter will rob and stunt the leader. But in such instances, the evil is readily remedied by pinching the points of the laterals when they are beginning to grow, which will force the sap into the leader, and give it the requisite start. You must also observe, that in some soils, neither the Oak nor the Chesnut thrives; and even if they do thrive, stunted individuals will be sometimes found, just as is the case among ourselves. Warner's Black Hamburgh and the common Black Hamburgh Grapes are the same.—†

A Subscriber.—There are two reasons for Black Grapes assuming a red and half-ripened appearance. The first is, when too great a crop is allowed to remain upon the Vines; and the second, when the leaves nearest to the bunches are removed, as is often done, upon the vain supposition that more light will be admitted to the fruit. If either of these cases is applicable to your Black Hamburgh Vine, it will at once account for the reddish colour of the berries.—‡

J. G.—The Newington Nectarine ranks among the Clingstones, or those having firm flesh, which requires to be sliced from the stone: these kinds are not in perfection till they begin to shrivel. Although the summer may have been dry, if much rain falls when they are nearly ripe, the fruit is apt to rot next the wall, or drop off. The only remedy is to lessen the vicissitudes of drought and moisture, by keeping the border well mulched and watered in dry weather.—‖

F. D.—The Chasselas Musque is a white round-berried Grape, resembling in appearance the White Frontignan; but from this it is distinguished by its leaves being rounder, and not so much indented; its pulp is somewhat firmer, with nearly the high Muscat flavour of the White Muscat of Alexandria. It is in cultivation among the London nurserymen, and can be procured by any agent who will take the trouble to inquire for it. You should wash your Peach-trees well with the garden engine every evening during dry weather; this will put an effectual check upon the ravages of the Red Spider. If this is properly attended to in the months of May and June, there is little fear of the leaves of your trees being injured by this insect.—‖ ‡

Tabanus.—Your moth is the Plúsia gamma, figured and described at p. 52 of this year's *Chronicle.*—‡

J. T., Plymouth.—The dead roots of Orchidaceous Plants should be cut carefully away when they are repotted. Any old dead pseudo-bulbs should also be removed, as they are liable to rot the living ones. These plants have no true bulbs; the term pseudo-bulb is, therefore, a general term. It is, in fact, the stem, and is round or conical in some, such as the Stanhópea; or elongated in others, as in Cáttleya. Charcoal mixed with the sphagnum will do no harm, but little is known concerning its effects. Water should not be discontinued so long as roots or leaves are forming, as that is the period when it is required. Some of the kinds are evergreen, and ought never to be kept perfectly dry; others, such as the Catasetum, lose their leaves at certain seasons, and then require a period of rest.—§

H. S.—If your Vines died from the effects of being transplanted, that operation must have been badly managed. Kyanised Boxes are injurious to the growth of plants, and should never be used for such purposes, unless the interior has previously received a coat of pitch or paint.—‡

B. K.—Thanks. The figures are for the *Chronicle.*—†

K. B.—Your plants are Desmódium nutans, and Búddlea Neemda.—†

Your Careful Reader.—We will inquire.—†

G.—The following is a list of 12 choice Greenhouse plants that flower in August and September:—Hedýchium Gardnerianum, which does best when planted in the border of the house; Mímulus glutinosus, Leonotis Leonurus, Bouvárdia splendens, Achimenes longiflora, Chirónia frutescens, Swainsónia galegifólia, S. galegifólia alba, Mandevilla suaveolens, Lílium lancifólium and its varieties, Sóllya linearis, and Leschenáultia formosa.—‡

A. P.—Your specimens are, 1, Coronilla glauca; 2, Gnídia pinifólia; 3, Eugénia uniflora; 4, Adenandra uniflora; 5, Edwárdsia microphylla.—†

A Market Gardener.—To clean Radish-seed, you must first dry the pods *well*, previously to thrashing them; the seed should afterwards be sifted and fanned, to separate all dirt and refuse from it.—‡

T. G.—Your large Apple is the Pomme Violette; the other is the Red Crofton.—‖

Cambriensis.—Your Pears are, No. 1, Summer Franc-réal; 3, Autumn Bergamot; 4, Duchesse d'Angoulême; 5, Winter Nelis; 6, Chaumontel; 7, Easter Beurrée: and your Plum, No. 2, is Coe's Golden Drop.—‖

A Reader.—Your tree is Pópulus cándicans, one of the Tacamahac Poplars.—†

A Subscriber, Durham.—The following lists of single and double Hyacinths for growing in pots or glasses contain a good selection of colours, and they are made to suit the pleasure of purchasers, as regards the expense of the roots.

SINGLE.

Cheap.	*Dearer.*
Mars, deep red.	Le Franc de Berkebey, deep red.
Acteur, rose.	Lustre de Flore, rose.
Felicitas, rose.	Monsieur de Fœsch, fine rose.
L'Ami du Cœur, rose.	Prince Albert of Prussia, deep blue.
Asterias, deep blue.	Quentin Durward, deep blue.
Buonaparte, deep blue.	Bouquet Charmant, dark blue.
Emicans, dark blue.	Grande Vidette, superb lgt. blue.
Robinson, blue.	Colossus, white.
Nimrod, blue.	Baron van Tuyll, blue.
Grand Vainqueur, white.	Rousseau, white.
Emilius, blue.	Princesse Royale, rose.
Hercules, white.	Voltaire, white.

DOUBLE.

Waterloo, dark red.	Goethe, dark red.
Acteur, deep rose.	Perruque Royale, deep rose.
Comtesse de la Coste, deep rose.	Sir Walter Scott, deep rose.
Groot Voorst, deep rose.	Bouquet Royal, light rose.
Kroon van Indien, very dark.	Bouquet Pourpre, very dark.
Orondates, deep blue.	Prins van Saxen Weimar, deep blue.
Duc d'Angoulême, blue.	Murillo, blue.
Paul Boot, light blue.	Madame Marmont, light blue.
Gloria Florum, white and rose.	Prince of Waterloo, white.
La Déesse, white with yellow.	Grand Monarque de France, white and rose.
Virgo, white and rose.	Ne plus ultra, blue.
L'honneur d'Amsterdam, deep rose.	Milton, dark red.—*

E. M.—The plant is Leonotis Leonurus. Some account of it will be found at p. 4 of our *Chronicle* for 1841, and in the Calendar of Operations of to-day. We should be greatly indebted for the Nos. so kindly offered us.—†

E. F. L.—Sorry to hear of your want of success with your Bees. You had better read "My Bee-Book," by Mr. Cotton.—†

M. C.—Your plants are—1, Medicago arbórea, which will not stand without protection, except in very mild winters; 2, Coronilla glauca; 3, Collómia grandiflora; 4, Trevirana coccínea; 5, Lythrum virgatum; 6, Crucianella stylosa; 7, Ipomœa coccínea, which, in such a season as this, will seed freely. It cannot be increased by cuttings. Of your Pears, No. 1 is the White Doyenné, and 9 the Glout Morceau. Your Apples are, 2, Hollandbury; 3, Hawthornden; 4, Unknown; 5, A kind of Crab; 6, French Crab; 7, Ribston Pippin; 8, Cockle Pippin; 10, Old Codlin; 11, Fearn's Pippin. The Peach is the Melting Sanguinole, not much known, we presume, in this country. There are other varieties with flesh adhering to the stone, and of the colour of a Beet-root; but they are only fit for being made into a preserve. The Walnut has a very thin shell, but it is not well filled.—‡ ‖

Berkshire.—Thunbérgias are very liable to be attacked by the Red Spider, unless frequently syringed; and if you do not soon check their progress, these insects will spread over your Pelargoniums. The best method of destroying them upon single plants is that practised by Mr. Knight, viz., to procure wheel-bellows, which have a box capable of being filled with flowers of sulphur, and having a rose on the end containing pieces of feathers; this apparatus will dust the sulphur more equally over the plants, which should be perfectly dry when the former is applied. After a few days the plants should be well syringed to wash off the sulphur, and any insects which may remain.

Lychnis Bungeana is a native of Chinese Tartary, and is not difficult to flower.—‡

A Housekeeper.—Your White Currant Jam turned red because it was exposed to the air before it had been sufficiently boiled. There is something in the skin of the White Currant which becomes red upon exposure to the air after imperfect boiling. Your jelly did not turn red because you did not allow the skins to be mixed with it.—†

Mr. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3*d.* each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5*s.* for every 25 copies.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

Our news from the United States contains the gratifying intelligence that the mission of Lord Ashburton has been successfully concluded, by the ratification of the treaty with this country. It passed the Senate, after a long discussion, by a majority of 39 to 9. The questions set at rest by this treaty, are those connected with the boundary, the slave-trade, the affair of the Creole, the destruction of the Caroline, and the arrest of Mr. M'Leod. The three latter are made the subjects of a correspondence, in which explanations are given on both sides, and arrangements made for the future. The terms of the boundary treaty are substantially the same as those published by anticipation some time back; they assign part of the St. John's River as the future frontier, and give to the State of Maine the free navigation of the river through New Brunswick to its mouth. The line is regarded on the whole as a fair compromise, and is more advantageous to this country than that awarded by the King of Holland. In regard to the slave-trade, provision is made by which each nation agrees to maintain a squadron on the coast of Africa, to act in concert, and co-operate for the suppression of the traffic; both nations further agree to unite in representations and remonstrances with other powers in order to effect the closing of the slave-markets at once and for ever. Another arrangement is made for the mutual extradition of persons charged with murder or other heinous crimes. The questions of impressment and the right of search were not included in Lord Ashburton's instructions, and are, consequently, not mentioned. The New York papers of all shades of politics dwell with satisfaction on these results, and express their conviction that they will be the means of producing in both countries those feelings of satisfaction and good-will which are the surest guarantees of a lasting peace. Since the ratification of the treaty, Lord Ashburton has been publicly presented to the citizens as the Ambassador of Peace, and has been received by all classes with an enthusiasm which proves the importance of his mission and the value of its results.—Our Continental news is comparatively uninteresting, and is rather of a domestic than general character. In France, the Journals are occupied in discussing various subjects of home politics, chiefly in reference to the movements of parties preparatory to the ensuing session. The news from the Peninsula is unimportant, and our German advices are principally confined to the festivities at Cologne, on laying the foundation stone of the new works for the restoration of the Cathedral. The King of Hanover, as stated in our last, has been seriously indisposed at Dusseldorf, but is now convalescent.—From Constantinople we learn that the Syrian question is on the eve of adjustment, and that the Lebanon will be divided into two districts, in order that the Druses and the Maronites may be governed by their own princes, under the control of the Porte. No renewal of hostilities has occurred on the Persian frontier, and the affair has almost ceased to attract attention.

At home, the Queen arrived in the River at an early hour this morning, on her return from Scotland, and landed at Woolwich about ten o'clock. Her Majesty and the Prince are said to be highly gratified with their visit to Scotland, and with the loyalty of their reception.—The manufacturing districts continue in an unsettled state. Special commissions have been ordered for the trial of the rioters in Lancashire and Staffordshire; the trials will commence early in the ensuing month, and all the prisoners concerned in the late disturbances will then be brought to justice. In Manchester and Stockport the great body of weavers still refuse to return to work at their former wages, and there is little prospect of any concession on the part of the masters.

Home News.

Court.—Her Majesty and Prince Albert returned to Dalkeith on Tuesday last from a visit to the Highlands, and embarked on Thursday for London. They landed at Woolwich this morning, and proceeded immediately to Windsor. The Prince of Wales and the Princess Royal are at Windsor Castle, and are in excellent health.—Despatches have been received in town stating that the King of Hanover has been seriously indisposed at Dusseldorf, but is now so far recovered that no further bulletins will be issued.—His Royal Highness the Duke of Sussex and the Duchess of Inverness arrived on Friday evening, at Alton Towers, on a visit to the Earl and Countess of Shrewsbury. The Royal Duke will remain a week, and then proceed on a visit to the Duke of Devonshire at Chatsworth.—Her Royal Highness the Duchess of Gloucester is expected to arrive at Chatsworth on the 24th inst., on a visit to the Duke of Devonshire.

Official Movements.—General Sir Robert T. Wilson has been appointed Governor of Gibraltar in succession to Lieut.-General Sir Alexander Woodford.—It is currently reported that the Duke of Wellington intends to avail himself of his present position as General Commanding-in-Chief, to recommend to Her Majesty to confer some mark of her royal favour on his Grace's old companions in arms, the officers who served with him in the Peninsular War.

Foreign.

FRANCE.—*The Journals.*—The principal subjects of interest in the papers this week are rather of a domestic than general character. The Ministerial journals attack the Legitimist prints and leaders, whilst they flatter the Legitimist party. They profess to admire the principles which actuate the partisans of the fallen dynasty; but object to the persons and family they worship. M. Berryer is the chief object of their attack, and they denounce him with great animosity for his alleged alliance with republicans. The Legitimist prints reply by indignantly rejecting the proposed alliance. The Clergy is another class to which the Ministerialists pay court. Seats in the Chamber of Peers are said to be offered to the prelates. The organ of the clergy remarks upon this statement that there are not five prelates who would consent to sit, and share the moral and political obloquy attached to so many necessary votes. Whilst the Legitimist and Ministerial prints are thus engaged, the war organs insist that France ought to make an instant descent on Syria. The Republicans declare that Admiral La Susse should land his Marines to deliver the Maronites from the Druses. In regard to the introduction of Bishops into the Chamber, the Ministerial journals deny that Government has any such intention, "the Charter having already fixed the categories of those who can be made Peers, and having excluded ecclesiastics."

The Capital.—M. Royer Collard has refused to be promoted to the Chamber of Peers, from the belief that the judicial powers arrogated by them are unconstitutional. The Minister of Marine has instituted a committee to inquire into the grievances of the merchants interested in the gum trade against the company to whom the Governor of Senegal made over, in January last, the monopoly of that article. The committee, composed of delegates from the Chamber of Commerce, and of the Director of the Colonies, is to meet in Paris towards the latter end of September.

The Provinces.—The papers announce with much regret the death of Hénin, the intrepid sailor of Boulogne, who so nobly risked his life in attempting to save the female convicts shipwrecked in the Amphitrite. The Calais papers pay the following tribute to the memory of this brave man:—"It was in attempting to bring to perfection an idea that he had formed for saving the lives of his fellow-creatures, that this ornament to the marine of France met with his untimely end. For some time past Hénin had been practising to sustain a considerable weight in the water, but in returning on board of the safety-boat he received a violent contusion, which, becoming more serious from day to day, ultimately brought him to the grave. Hénin was always the first to fly to the assistance of the distressed, always in the foremost rank to rescue the shipwrecked mariner from a watery grave, and in every situation of danger he set a noble example of coolness and intrepidity. The cross of the Legion of Honour, and numerous medals, decorated his breast, the rewards of his bravery and philanthropy." The "Presse" announces that it was in error in announcing last week that the Government had signed a treaty with a company consisting chiefly of English shareholders for the execution of the railway from Paris to Lille, but states that negotiations are still pending.—The Duke d'Aumale is said to have purchased for 2,000,000f. the estate of Château-Margaux, which formerly belonged to M. Aguado.—It is mentioned, as a proof of the embarrassed state of the landowners in the wine-growing department of the Gironde, that the amount of mortgages is 300 millions of francs.—The Paris papers state that M. de Molêne, Judge of Instruction, and M. Mongis, Substitute of the Procureur du Roi, were on Tuesday summoned to Joinville, near Saint-Maur, by a mysterious circumstance, relative to which it is to be hoped that the official journals will give some explanation. It appears that the preceding Sunday an explosion took place on the bridge of Joinville, from an infernal machine, which was placed there, filled with balls and other projectiles, by none of which, fortunately, was any person wounded. These magistrates have not been able to discover either the object or the authors of this machine, of which the shattered remains alone were left.

The Royal Family.—The Duke de Nemours reviewed, on Monday, at Compiegne, the divisions of infantry and cavalry forming part of the corps of operation on the Marne, which was to have been commanded by the late Duke of Orleans, and distributed a number of decorations and promotions to the officers and soldiers of that corps. At the conclusion, after having passed down the whole of the lines, his Royal Highness ordered all the officers to be formed in circles, and then from his charger delivered an expressive address to them, alluding in affecting terms to the loss they had all sustained by the death of the Duke of Orleans, and taking his leave for the present with assurances that his feelings and energies were and ever should be devoted to them, and to the task of restoring to France the support of which she had been deprived by her recent loss. This address was received with acclamations of "Vive le roi! Vive le Duc de Nemours!" His Royal Highness on the next morning left for the Chateau d'Eu. On Tuesday, the King, Madame Adelaide, the Duchess de Nemours, the Princess Clementine, and the Duke de Montpensier, accompanied by Marshal Soult, M. Guizot, and the Minister of Marine, proceeded from Eu to Tréport, where they embarked on board the brig La Reine Amelie, to visit in the roadstead the Pluton, and the Licorne, naval school-ship. The King passed in review the pupils of the Licorne, and addressed to them a few words of encouragement, which were received with loud acclamations. M. Janvier, the Captain, and two other officers, received the Order of the Legion of Honour from his Majesty. The King and their Royal Highnesses partook of breakfast on board the Licorne, to which they invited all the pupils of the naval school.

Algeria.—The journals mention that the English coal brig, the Dean, from Liverpool, reached Algiers, on the 4th instant, with iron and coal. The French authorities soon discovered that Mr. Scott, or Colonel Scott, who has been and is in the service of Abd-el-Kader, was on board. Mr. Scott did not conceal the fact, but avowed himself the minister of Abd-el-Kader. General Bugeaud said he would send him back to France, but Mr. Scott insists on being sent to Spain. He is in arrest on board the Dean.—The last accounts from Algiers are of the 5th inst. The Governor-General left in the Phare, steamer, on the 3d, for Oran, to organise the different tribes of the province, who lately submitted to the French, and to instal the new Bey of Mostaganem. The country around Algiers was tranquil, and the market plentifully supplied with provisions. On the 30th ult. the powerful tribe of the Issers made their submission, and their chiefs arrived at Algiers to receive the investiture. The Beni-Llimans had likewise demanded the Aman. Their Aga, Mahi Eldine, had presented himself, with his 600 horsemen, to the Governor of Medeah, and taken the oath of allegiance to the King of the French. He left his children as hostages, and undertook to convey to Medeah the corn belonging to Abd-el-Kader.

SPAIN.—The celebration of the second anniversary of the revolution of September has just taken place. The Regent held a review of the National Militia and garrison, and assisted, with the civil and military authorities, at a grand *Te Deum*, chanted in the church of San Isidro. Everything went off quietly and orderly, notwithstanding the immense multitude which had turned out on the occasion.—The official journals contain a long article in praise of a joint-stock bank of English and Spanish shareholders, proposed by Col. Bristow. The Ministry expresses great satisfaction at finding its credit properly appreciated by the British capitalists. In its opinion, all the stipulations of the project are wisely conceived and perfectly equitable; and it urges Spanish capitalists to join in the enterprise, at least for one-fifth, that is, to subscribe for 4000 shares. The utility of the bank, according to the Ministerial organs, cannot be questioned, and the Government had taken the subject into serious consideration, in order to assure itself whether it offered any inconvenience to the public, and to encourage a measure which promised to be so beneficial to the country.—According to the Barcelona journals of the 6th inst., two small bands had made their appearance near Vich and Villadran. One of the rebels belonging to the latter had been taken prisoner and shot. On his way through Girona, General Zurbano delivered a list of 11 Republicans to the first constitutional alcalde, with an order to expel them from the province within three days. The alcalde was to be personally answerable for the execution of this order.—A sanguinary conflict has taken place between the inhabitants of Vinaroz and Benicarlo. General Van Halen immediately despatched a battalion of the regiment of San Fernando, and likewise the war-steamer Isabella II., to the scene of disorder.

PORTUGAL.—The Lisbon mail of the 5th inst., which arrived on Saturday at Falmouth, brings information of the arrangements made for covering the deficiency in the ways and means for the present year; the Legislature having sanctioned the proposal of the Ministry to raise money in anticipation of part of the taxes to be collected next year.—It was believed that a fresh misunderstanding had occurred between Spain and Portugal, arising, it was supposed, out of M. Almadovar's ill-will to M. Costa Cabral and the commercial treaty lately concluded between Great Britain and this country.

HANOVER.—Despatches have been received in town this week confirming the rumour that the King of Hanover, who had gone to the banks of the Rhine, to be present at the reviews of the Prussian troops, had caught cold, and had been confined at Dusseldorf by a fever. The bulletins of the physicians now announce that the fever has abated, and that his Majesty's speedy recovery may be expected. The latest bulletin, dated the 5th September, says that he had a good night, that the fever had entirely left him, and that his complete recovery may shortly be looked for. The papers in the mean time have announced that the King had followed the example of the ex-King of the Netherlands, and married, towards the close of last month, the widow of the President Beulwitz; but the report seems to be equally premature with the account of his death, which the same journals published last week.

GERMANY.—Letters from Cologne contain detailed accounts of the festivities on laying the foundation stone of the new buildings for the restoration of the cathedral. The ceremony took place on Sunday, after divine service had been performed in the Protestant church and high mass celebrated in the cathedral. The King and Queen were present at both services. Prince Metternich, Prince George of Cambridge, the Archduke John of Austria, the Grand Duke of Mecklenburg Schwerin, and the Duke of Nassau accompanied the King. After church the royal party proceeded to the spot on the south side of the aisle which had been prepared for the laying of the first stone, when the King, on proceeding to perform the ceremony, addressed a speech of some length to the assembled multitude, in which the leading theme related to the wishes, political and religious, of the Germanic states. Illustrating by historical allusions the advantages which other countries had drawn at various periods from the disunion prevailing in Germany, he glanced skilfully at a recent attempt to do the same on the part of a neighbouring power; but which attempt, he congratulated himself and them, was decisively foiled by the display of unanimity which Germany under arms put forth. "This day," continued the royal orator, "is destined to record a display of unity not less important. It will record, for those who doubt, the fact that, although various shades of doctrine and opinion may divide us, yet that Christendom is not disunited—that it forms one great and indomitable whole. In sign of this conviction, the representatives of all confessions and of every German land were there, and each felt that he derived strength from the consistency that he lent to the general fabric." The King was interrupted here by loud acclamations, and when they had subsided, added, "The sentiments I have uttered have met with the heartfelt applause of a city like yours; let us give the ancient word once more—'Cologne for ever' (*Alaff Cölln*)." At this the shouts were redoubled. After some further speaking the assembly broke up, and the company met in an immense tent, a present from the Emperor of Russia, in which 400 covers were laid. The banquet passed off gaily, and in the evening the company appeared at the theatre. The King and Queen then left for the Castle of Brühl, near Bonn, where they stayed until the two camps united and performed their manœuvres. In the evening the town was illuminated, and the Rhine front produced a rare and brilliant effect on the water. The account of the ceremonies in the Cologne papers fills no less than 13 quarto columns. The printed lists of foreign officers, who are at head-quarters during the reviews, includes 157 persons. The English are much more numerous than the others, for there are 59 of them, amongst whom, besides Lords Westmoreland and De Grey, there are five Lieutenant-Generals, two Major-Generals, four Colonels, seven Lieutenant-Colonels, two Majors, sixteen Captains, and nineteen Lieutenants and Ensigns. On the 7th the King and Queen paid a visit to Aix-la-Chapelle, where they were received with great enthusiasm.—According to the Frankfort journals of the 6th instant, petitions were in progress of signature at Cologne, Aix-la-Chapelle, and Dusseldorf, and other towns of Rhenish Prussia, for the purpose of demanding a reform of the municipal and district institutions of those provinces.—The "Augsburg Gazette" announces, under the head Vienna, the 3d, that a camp of manœuvres would be formed in the beginning of October, on both banks of the Mincio, to the south of the Lago di Garda. It is to be composed of 34 battalions of infantry, 22 squadrons of cavalry, and 12 batteries of artillery. The evolutions are to be commanded by Count Radetzki, General-in-Chief of the Austrian forces in the Lombardo-Venetian kingdom. Other manœuvres are to take place about the same period at Friuli.—Letters from Dresden state that a calamitous fire broke out on the 31st ult., in the extensive forest near Sebnitz, in the Saxon Switzerland, on the frontiers of Saxony and Bohemia, which was not extinguished on the 2d instant. It commenced on the Bohemian side, and in a few hours resembled a sea of flame. At the distance of three leagues the sun looked like a ball of fire. In Bohemia the loss is immense. All human aid seems to have been vain. The long-continued heat and drought made every blade of grass so inflammable, that the fire raged with unabated fury. The wind, which blew towards Bohemia, drove the flames down the mountain, placing the detached houses and the villages in the forest in the greatest danger. Another account, dated the 4th, says that the fire still continues. A thousand men were employed in endeavouring to stop its progress, but upwards of 500 acres of forest had already been destroyed.

ITALY.—Letters from Rome state that Capt. Cialdi, of the Papal Marine, has received from the Pontifical Government orders to proceed to Egypt to take charge of the obelisk which Mehemet Ali has presented to the Pope. It is well known to Egyptian travellers, and is called by them the obelisk of Sesostris; but the Egyptians call it the obelisk of the Patriarch Abraham. Rome will now possess twelve obelisks, all brought from Egypt.—The arrival in the Tiber of the three steamers constructed in England for the Pope, was the occasion of a popular festa, at which the principal functionaries of the State, the Cardinals, and a number of distinguished foreigners assisted. Notwithstanding the shallowness of the water, the windings of the river, and the sandbanks which frequently obstruct its bed, the steamers ascended, in four hours, a distance which generally required nearly as many days.—The King and Queen of Naples returned to their capital from Messina on the 24th, in the Vesuvius steamer, escorted by five frigates. The future Empress of Brazil was shortly to sail for Lisbon, accompanied by Prince de Scilla, Minister for Foreign Affairs.

SWITZERLAND.—The Geneva papers contain the following account of an ascent to the Dent du Midi:—"At 8 o'clock in the morning of the 19th ult., six persons left the plain of Sallanches, and began to climb the lofty mountain. As they kept a tolerably quick pace, they in four hours reached the vast sea of ice called the Planevé. This glacier, from the Gothic and capricious forms of the rocks by which it is surrounded, bears the appearance of an impregnable station, fortified at every point by the skilful and laborious hand of man. About 3 in the afternoon, after vanquishing a thousand difficulties, the party gained the summit of the colossus. This they found to be a plain, slightly inclined, of about 30 feet in length, by 20 in breadth, and rearing itself 1,500 feet above the Glacier de Planevé. We do not learn, however, that this undertaking has produced any new fact or observation of interest to science."—The papers state that the Executive Council of Lucerne resolved, on the 2d, to exclude the Jesuits from the direction of the Central Establishment of Education.

Russia.—Accounts from St. Petersburg state that, notwithstanding the official contradiction of the Government, a conspiracy has certainly been in progress among the Russian nobility against the Emperor, and that several regiments of the guards in garrison at St. Petersburgh were tampered with by the disaffected. Money was distributed, and considerable sums were found on officers, serjeants, and men. The secret police of the Emperor received information from the conspirators themselves, and to the disclosures thus made is attributed the duel between the Princes Dolgorucki and Jaschwyl, which took place without seconds, and in which the former was left dead on the spot from his adversary's ball. In fact, the conspiracy failed completely; and the well-inclined regiments were informed of what was going on: the people of St. Petersburgh, meanwhile, remained completely neuter, or rather fascinated by the ascendancy of the Emperor, so that the conspiracy was purely confined to the military and nobility. It is said that the aim of this movement placed the life of the Emperor in danger, and that the intention was to proclaim the young Grand Duke Alexander, now twenty-two years of age, and to form for him a sort of council of regency, to direct his affairs, whilst the young Prince would only reign in form. The danger has been averted for the moment, but the position of the Emperor Nicholas remains exceedingly critical, having on one side a disaffected nobility, and, on the other, Poland held in subjection, and Germany tired of the Muscovite influence, and slipping away completely from the Russian alliance. The unfortunate war in the Caucasus annoys in no small degree the national pride, and adds to the critical condition of this colossal empire.—Further accounts of Prince Gagarin's death, noticed in a late Number, have been received. They state that an enormous corruption reigns in the Russian administration, and embezzlement in finances and venality in the highest functions have become quite notorious. The Emperor, they say, has no power to remedy it, even should it be his interest to do so; the evil is too great. It is now ascertained that Prince Gagarin discovered numerous deficiencies, which compromised not only Subalterns, but persons high in office. One of the Subalterns, M. Reimann, instigated by some person yet unknown, but equally compromised, went to the Prince's cabinet, situated in the Imperial Palace. M. Reimann, a Finlander by birth, employed in the department of the royal forests, entreated Prince Gagarin not to implicate him in the discovery then making. The Prince said he would make him an example. Reimann then exclaimed:—"I am lost, Prince; would you ruin me?" The Prince again answered:—"I must do my duty, and denounce you with the others to the Emperor." Reimann immediately drew a pistol from his belt and shot the Prince dead. He then endeavoured to escape, but the report had been heard, and he was seized and imprisoned. He has since died from the wounds he received during the infliction of the knout.—It is announced in letters from Warsaw that the Princess Mary, wife of the Crown Prince, has been delivered of a daughter, who has received the name of Alexandrina.

Turkey and Syria.—Letters from Constantinople state that the Syrian question is upon the eve of adjustment. It is affirmed that a project of arrangement has been drawn up by the Supreme Council of the Porte, and communicated to the Ministers of the Great Powers. According to this project, the Lebanon will be divided into two districts. The Maronites will be governed by a Christian Prince of the Sheab family, and the Druses will select a Governor among their own Sheiks. Both tribes will be placed under the military and civil control of the Turkish Pacha of Acre or Damascus. This arrangement, if adopted, appears to be satisfactory. It will, at all events, remove all pretext for just complaint, as both Druses and Maronites will obtain what they have demanded in their petitions; and the honour of the British and Austrian Governments, pledged in a certain measure to the Syrians, will now be satisfied. Nothing has occurred on the Turkish-Persian frontier to indicate serious hostilities.

United States.—The steam-ship Britannia arrived at Liverpool on Wednesday morning, after an excellent run of ten days and a half from Halifax, and fourteen and a half from Boston. She sailed from the latter place on the 1st, and from the former on the 3d instant. The mission of Lord Ashburton has been brought to a successful termination, by the ratification on the part of the Senate of the treaties with this country, after a long discussion, by a majority of 39 to 9. The terms of the boundary question are nearly if not quite identical with those already published, and provision is made for the suppresion of the slave-trade on the coast of Africa, and for giving up to the proper authorities of either country the fugitives who escape from justice; but no allusion is made to impressment. The right of search is *in statu quo*, and the boundary question on the Pacific side is still left open. The following articles contain the definition of the boundary line, and the regulations in regard to the slave-trade; the others refer to minor arrangements, contingent on the more important clauses:—It is hereby agreed and declared that the line of boundary shall be as follows:—"Beginning at the Monument at the source of the River St. Croix, as designated and agreed to by the Commissioners under the 5th article in the treaty of 1794, between the Governments of the United States and Great Britain; thence, North, following the exploring line run and marked by the Surveyors of the two Governments in the years 1817 and 1818, under the 5th article of the treaty of Ghent, to its intersection with the river St. John, and to the middle of the channel thereof: thence, up the middle of the main channel of said River St. John, to the mouth of the River St. Francis: thence, up the middle of the channel of the said River St. Francis, and of the lakes through which it flows, to the outlet of the Lake Pohenagamook: thence, southwesterly, in a straight line to a point on the north-west branch of the River St. John, which point shall be distant ten miles from the main branch of the St. John, in a straight line, and in the nearest direction; but if the said point shall be found to be less than seven miles from the nearest point, or summit, or crest of the highlands, that divide those rivers which empty themselves into the River St. Lawrence from those which fall into the River St. John, to a point seven miles in a straight line from the said summit, or crest; thence, in a straight line in a course about south 8 degrees west to the point where the parallel of latitude of 46 degrees 25 minutes north intersects the south-west branch of the St. John; thence, southerly, by the said branch to the source thereof in the highlands at the Mefjarnette portage; thence, down along the said highlands which divide the waters which empty themselves into the River St. Lawrence from those which fall into the Atlantic Ocean, to the head of Hall's stream; thence, down the middle of the said stream till the line thus run intersects the old line of boundary surveyed and marked by Allentine and Collins previously to the year 1774, as the 45th degree of north latitude, and which has been known and understood to be the line of actual division between the States of New York and Vermont on one side, and the British province of Canada on the other; and, from the said point of intersection, west along the said dividing line as heretofore known and understood, to the Iroquois or St. Lawrence River.—It is moreover agreed, that from the place where the Joint Commissioners terminated their labours, under the 6th article of the treaty of Ghent, to wit, at a point in the Neebrik Channel, near Muddy Lake, the line shall run into and along the ship channel between St. Joseph and St. Tammany Islands, to the division of the channel at or near the head of St. Joseph's Island; thence, turning eastwardly and northwardly, around the lower end of St. George's or Sugar Island, and following the middle of the channel which divides St. George's from St. Joseph's Island; thence up the east Neebrik Channel, nearest to St. George's Island, through the middle of Lake George; thence west of Jona's Island, into St. Mary's River, to a point in the middle of that river, one mile above St. George's or Sugar Island, so as to appropriate and assign the said island to the United States; thence adopting the line traced on the maps by the Commissioners, through the River St. Mary and Lake Superior, to a point north of the Isle Royal in said lake, 100 yards to the north and east of Isle Chapeau, which last-mentioned island lies near the north-eastern point of Isle Royal, where the line marked by the Commissioners terminates; and from the last-mentioned point, south-westerly, through the middle of the sound between Isle Royal and the north-western main land, to the mouth of Pigeon River, and at the said river, to and through the north and South Fowl Lakes, to the Lakes of the Hight of Land, between Lake Superior and the Lake of the Woods; thence along the water communication to Lake Saisaquinaga, and through that lake; thence to and through Cypress Lake, Lac du Bois Blanc, Lac La Croix, Little Vermilion Lake, and Lake Namecan, and through the several smaller lakes, straits, or streams, connecting the lakes here mentioned, to that point in Lac de la Pluie, or Rainy Lake, at the Chaudière Falls, from which the Commissioners traced the line to the most north-western point of the Lake of the Woods; thence along the said line to the said most north-western point, being in latitude 49 deg. 23 min. 55 sec. north, and in longitude 95 deg. 14 min. 38 sec. west from the Observatory at Greenwich; thence, according to existing treaties, due south to its intersection with the 49th parallel of north latitude, and along that parallel to the Rocky Mountains. It being understood that all the water communications, and all the usual portages along the line from Lake Superior to the Lake of the Woods, and also Grand Portage, from the shore of Lake Superior to the Pigeon River, as now actually used, shall be free and open to the use of the citizens and subjects of both countries.—It is further agreed that the channels in the River St. Lawrence, on both sides of the Long Sault Islands, and of Barnhart Island; the channels in the River Detroit, on both sides of the island of Bois Blanc, and between that island and both the American and Canada shores, and all the several channels and passages between the various islands lying near the junction of the River St. Clair, with the lake of that name, shall be equally free and open to the ships, vessels, and boats of both parties.—The parties mutually stipulate that each shall prepare, equip, and maintain in service, on the coast of Africa, a sufficient and adequate squadron, or naval force of vessels, of suitable numbers and descriptions, to carry in all not less than 80 guns, to enforce separately and respectively the laws, rights, and obligations of each of the two countries, for the suppression of the slave-trade; the said squadrons to be independent of each other, but the two Governments stipulating, nevertheless, to give such orders to the officers commanding their respective forces, as shall enable them most effectually to act in concert and co-operation, upon mutual consultation, as exigencies may arise, for the attainment of the true object of this article; copies of all such orders to be communicated by each government to the other respectively.—Whereas, notwithstanding all the efforts which may be made on the coast of Africa for suppressing the slave-trade, the facilities for carrying on that traffic and avoiding the vigilance of cruisers, by the fraudulent use of flags, and other means, are so great, and the temptations for pursuing it, while a market can be found for slaves, so strong, as that the desired result may be long delayed, unless all markets be shut against the purchase of African negroes; the parties to this treaty agree that they will unite in all becoming representations and remonstrances, with any and all powers within whose dominions such markets are allowed to exist; and that they will urge upon all such powers the propriety and duty of closing such markets at once and for ever."—The New York papers are unanimous in their approval of this result, and they congratulate Lord Ashburton and Mr. Webster on their completion of a noble monument, far greater and more glorious than any triumphs of military renown. Lord Ashburton is very popular with all classes, and in the great cities is an object of marked attention. At Boston, the Mayor introduced him to a public meeting of the citizens, where his lordship delivered an excellent and conciliatory speech. At Philadelphia his reception was equally enthusiastic, while at New York the public dinner at Astor House in honour of his arrival was expected to be on the first scale of magnificence. During his stay in the latter city, he was to receive the citizens at the City Hall. The importance of the treaty throws the miscellaneous news into the shade. Remarkable events, however, have occurred in the interval of the last arrival. The President had agreed to and signed a Tariff Bill, and had defended the policy pursued by him on this subject in a message to Congress, in which the exercise of the veto power forms necessarily the prominent topic. The House of Representatives was engaged in considering this document when the last accounts left Washington. Congress was expected to adjourn on the 1st.

Canada.—The mail does not bring much news from Canada. The rioters at St. Catharine's had assembled again, 1,000 strong, and proceeded to plunder; three companies of the 93d charged upon them; five were shot, and two or three bayoneted; about three died. It seems there was no other way of quelling the riot, which from the previous day's success, no military being in the town, had assumed an alarming appearance. Sir Allan M'Nab is at Montreal. The elections are going on, and a Mr. Papineau has been chosen for the Ottawa district. It is said in the Canada papers that the Queen intends to grant an amnesty to all concerned in the recent frontier disturbances.

West Indies and South America.—The latest letters from New York state that a mail had just arrived from the Bahamas, with intelligence that the royal mail steamer Medina had gone entirely to pieces. Part of her furniture and stores had arrived at Nassau, to be shipped to England. The Solway arrived at Nassau on the 15th. The General Assembly of the Bahamas had been prorogued to Sept. 29.—From Mexico we learn that the Mexicans have taken a war steamer belonging to Yucatan, and they have also assembled a large army, report says 50,000 men, designed for an invasion of Yucatan or Texas.—In Brazil the rebels had been again defeated, with a loss of 500, and the government had ordered that "no quarter should be given." The bridges on all the roads leading to Rio Janeiro have been torn up by the insurgents; and in the province of Minos the disaffection was strong, but in the northern provinces all was quiet. San Juan de Nicaragua is still blockaded by H.B.M. ship Electra, and an American vessel had been ordered off.

Cape of Good Hope.—Cape papers to the 8th July have arrived, which state that news had been received that the remnant of the force under Captain Smith had been cut off at Port Natal, and that to protect themselves they had surrendered to the Boers; but a later arrival denies this, and states that they are safe. The general accounts published as extracts of letters from Natal are extremely vague; they mention the seizure of the Mazeppa and Louisa, two coasting vessels, but they do not state positively that they remained in the hands of the enemy. Mr. Smellekamp, a Dutch supercargo, who is suspected of having incited the emigrant farmers to resistance, had been apprehended for travelling the colony without a pass. He has been examined on the subject of his visit to Natal, and he entirely disclaims being the representative of Holland, saying his mission was solely with the view to see what could be done in the way of trade. He alleges he told the Volksrood so when he was before that body, on their taking into consideration the expediency of publishing their manifesto against the British Government. In the state of excitement in which the colony had been plunged by this state of affairs, there was no certain reliance on the various rumours current. There were reports abroad of the rising of the Griquas in opposition to the Boers, and also of the large force which the latter had brought into the field to exterminate that tribe, and reinforce themselves in their position. On the frontiers the Kafirs were restless, but a vigilant watch was kept upon their movements. The Iris frigate had been taken up for the transport of troops. At Cape Town the council had determined to appeal against the proposition of Lord Stanley, to send out to the Cape, as a species of transportation, juvenile delinquents, hereafter to be apprenticed as servants. The majority of the council regarded the plan as one which, if not immediately repudiated, would render the Cape liable to the objection of being a penal settlement.

CITY.

Money Market, Friday.—The important intelligence from the United States has acted favourably on the public securities. Consols closed at 92¾ to ⅞ for money, and 93 to ⅛ for the account; New Three-and-a-Half per Cent. Reduced Annuities at 101 to ⅛; Exchequer Bills (2*d.*) 49*s.* to 51*s.* prem.; do. (2¼*d.*) 51*s.* to 53*s.* prem.; India Stock at 249 to 50½.

Metropolis and its Vicinity.

Chartist Meetings.—On Monday night a public meeting took place in the Vestry Rooms of St. Pancras, "for the purpose of taking into consideration the alarming state of the country, and to address her Majesty in consequence." The meeting was called for five o'clock, but up to half-past six not more than 50 persons, well-known Chartists from various parts of the metropolis, had assembled. At half-past six Mr. Nicholson, a Vestryman, took the chair. The Secretary, Mr. Wall, read letters from Sir Benjamin Hall, Sir C. Napier, and Mr. T. Duncombe, stating their inability to attend. Mr. Feargus O'Connor, however, made his appearance, and was received with loud cheers. The resolutions were of the usual kind, referring chiefly to the existing distress. Mr. Feargus O'Connor took an objection to the resolutions being moved *seriatim*, and said they should all be put together. Considerable confusion here ensued in consequence of the leading Chartists' interference, and Mr. Wall read the whole of the resolutions, and the address to her Majesty, which was of great length, but did not mention the Charter. This gave great offence to Mr. O'Connor, who denounced it as a trick. His admirers seemed to think the same, and the address was rejected.—Another attempt was made on the same day to hold a meeting on Clerkenwell-green. The time for holding it was to be 12 o'clock, and from 200 to 300 persons had assembled. Shortly afterwards a light cart drove into the middle of the Green, and about 12 persons got into it, when one of them began to speak. He had scarcely opened his mouth before a youth stepped forward, and said the meeting had not been authorised. This caused great confusion, which was finished by a person moving that the meeting adjourn. The boy in the cart immediately acted on the motion by driving off the ground with the speakers.

Metropolitan Improvements.—London Bridge, which has been undergoing a thorough re-paving since the 15th ult., was opened on Monday morning. The new pavement is laid down in granite stone, with a strong layer underneath, so as to withstand the wet and the great daily traffic. The carriage-way at each end has been raised a few inches, so that the bridge is now a straight line.

The Prisons.—There are at present confined in the Metropolitan prisons for debt—in Whitecross-street Prison, 409; in the Queen's Prison, 204; in Horsemonger-lane Gaol, 140; and in the Fleet, 85. There are very few in the Marshalsea, and the only remaining prison, with the exception of Tothill-fields, is the Borough Compter, where persons are confined from the Southwark Court of Record and Borough Court of Requests. The Fleet and the Marshalsea will shortly be closed, and the prisoners of those places removed to the Queen's Prison. Formerly as many as eight hundred were confined in the Bench, which comprises 114 rooms; there was likewise a large number in the Fleet. The Queen's Prison is about to be divided into several classes, and strict discipline enforced, particularly in respect to persons who are under remands from the Insolvent Debtors' Court, or who refuse to file their schedules under the compulsory clause of the Act. By the Queen's Prison Act, passed during the last session, the Secretary of State is empowered to make certain rules for the government of the prison, which are to be laid before Parliament.

Post-office.—It is stated in an evening paper, that the reason why the Postmaster-General has reverted to the old method of paying mail-guards by means of fees from passengers, is as follows:—About a year and a half ago a solicitor of Aberystwith purposely tried whether mail-guards obeyed their instructions not to receive fees. He offered a guard on the Aberystwith mail a gratuity, which was accepted. He immediately reported the circumstance to the General Post-office, and the guard, though a well-conducted young man, was dismissed. Very recently this same gentleman entrapped three other guards, and reported them. Lord Lowther, however, on considering the circumstance, rebuked his informant for designingly tempting men with money, and refused to entertain the complaint: and, having reason to believe that the practice is almost universal for guards not to refuse fees when offered them, he has resolved to place mail-coach guards on diminished salaries, and allow them to receive fees as formerly. This will reduce the Post-office expenditure upwards of 20,000*l.* a year. The guards on the railways, receiving now 130*l.* a year, will be paid for the future only 115*l.*, and those who have been receiving 70*l.* will have their salaries raised to 100*l.* per annum. It is hoped that some portion of the saving effected by Lord Lowther's alteration will be applied to increasing the wages of the letter-carriers.

London Streets.—Mr. Plummer, of Ludgate Hill, has addressed a note to the "Times," containing a statement of the number of persons, vehicles, and horses, that passed his house on Tuesday last, the 13th inst., from 9 in the morning to 9 in the evening; being an ordinary day of business, and at a time when London is considered empty. It appears that there were during the 12 hours, 2014 omnibuses, 1682 cabs, 4876 carriages of other kinds, making a total of 8572 vehicles. There were 13,024 horses, 33,256 persons riding in the above conveyances, and 72,096 foot passengers, making together 105,352 persons who passed the street. There were therefore 8572 vehicles in the 12 hours, 714 per hour, 12 per minute; 13,024 horses in the 12 hours, 1085 per hour, 18 per minute; 105,352 persons in the 12 hours, 8779 per hour, 146 per minute.

Mortality of the Metropolis.—The following is the number of deaths from all causes, registered in the week ending Saturday, Sept. 3, 1842:—Total, 827—males, 412; females, 415. Weekly average 1838-9-40-1, males, 467; females, 445. The mortality was thus distributed: South districts, 194; east districts, 188; central districts, 164; north districts, 159; west districts, 122.

Provincial News.

Manchester.—Some few weavers have gone to work this week, at a slight advance of wages, but the majority of them, both in this town and the neighbourhood, continue out. It was thought that Monday would witness the general resumption of labour in the out-districts, but the anticipations have not been realised. In the district eastward of the town the workpeople are idling about the streets. Through the investigations of Mr. Gregory, the Government commissioner, several of the leading Chartist speakers have been apprehended in the different districts, and committed for trial. Many of them were the parties who made themselves conspicuous in getting up the political Sabbath meetings in the open air, which have latterly been so frequently held. The neighbourhood of Ashton was the scene of a slight commotion on Monday. The authorities had received information that the operatives of Ashton and Hyde designed to visit Staley-bridge, and stop the mills; and orders were consequently given for the military to proceed to Staley-bridge, and protect the hands at work there, and prevent the destruction of property. Two troops of dragoons, and one troop of artillery, with two field-pieces, quitted Ashton at 3 A.M. for Staley-bridge, and by daybreak all the roads leading to the latter town were taken possession of by the military. Thus the plans of the turn-outs were defeated, and the mob, instead of leaving Ashton, held a meeting in an empty mill, which they occupy as a reading-room and meeting-room, and then broke up. The military having effectually prevented the irruption of the mob into Staley-bridge, received orders about 9 to proceed to a spot near Ashton and Dukinfield, and disperse a large collection of people, amongst which there was, as usual, a great number of women. This mob had assembled in some fields near Dukinfield, and had come there from Fairfield and Droylsden, for the purpose of holding a meeting. They were quickly dispersed by the military. The duty of the soldiers was not yet over. Having broken up this meeting, the dragoons were next ordered to gallop to Newton-moor, near Hyde, where a mob had attacked a mill, and commenced turning out the hands. Before the dragoons reached the spot, the mill had been stopped. On Tuesday, the weavers held a large meeting in the Chartist Hall, and some collision occurred with the police, who took 43 persons into custody and dispersed the meeting.

Stockport.—The turn-out in this town still continues. On Monday six or seven cotton-mills were again opened, some of which have since continued at work, though with a very small number of hands; and it is questionable whether the manufacturers will consider it advisable to keep them on. At some of the mills started on Monday there were not more than 20 hands, including all descriptions. The only mill at which there are any considerable number is Messrs. Bradshaw's, which has now been at work a week. The police and a number of special constables are in continual attendance, to protect the hands from violence when going or returning from their work. Numerous meetings of the turn-outs continue to be held every day at the Chartist Association Room, and the most resolute determination is expressed not to resume work below the rate of wages paid in January 1840. A resolution to this effect was agreed to on Saturday; and it was also resolved, that should any master offer the advance, the hands should not be allowed to resume work till the subject had been formally brought before a public meeting, in order to ascertain if the offer was a pretence to induce them to go in at the old terms. The number of the operatives assembling about the Chartist room on Monday was so great that the room, though capable of holding 800 or 900 persons, could not contain half of them. After some discussion, it was determined to adhere to the resolution passed on Saturday. Some of the manufacturers, through their managers, have had interviews with their hands, with a view of amicably settling the dispute; but in no instance has this object yet been effected, in consequence of the hands pertinaciously demanding the prices of 1840, which the manufacturers are not prepared to give. It appears that there are now 32 cotton-mills of various dimensions, only 11 of which are partially at work; the rest are standing. The money drawn from the savings-bank a few weeks ago was 1,300*l.*; it had since increased to 1,800*l.*; but on Monday the amount applied for had fallen to 300*l.*

Lancaster.—The writ for holding the special commission for the county palatine has been issued by Lord Granville Somerset, Chancellor of the Duchy, and was lodged on Monday with the High Sheriff, Mr. France, of Rowcliffe-hall. It fixes the commission-day for Tuesday, the 4th October. Several judges are named in the commission, but those expected to preside are Lord Abinger and Sir E. H. Alderson. The trials will be held in the Castle of this city.—We regret to learn that Mr. J. B. Garforth, the magistrate, of Coniston, near Skipton, is certain to lose one eye, and has been in great danger of losing both, from the wounds he received during the late affray with the turn-outs at Skipton. At the time Mr. Garforth received the injury, he was reasoning with them on the impropriety of their conduct.—At Bolton all the mills have been at full work, although the operatives in all or most of them have given notice to leave work unless their terms are complied with by the masters. Of these notices, some expire to-day. In the case of one mill at least, where the notice expired last Saturday, the hands applied for permission to continue at work until the notices given at the other mills had expired, which was consented to by the employers. The claims of the operatives are, ten per cent., with an abolition of the charge for gas. Whether a strike takes place or not will principally depend upon the terms of arrangement in other towns.—On Monday information was forwarded to the principal insurance-offices in the metropolis of the occurrence of a destructive fire on the night of Friday last at the saw-mills of Messrs. Fowler, at Bolton. It is believed that it was the act of an incendiary. The loss is covered by an insurance.—The Preston sessions, for the trial of the principal rioters in the late disturbances at Blackburn and the neighbourhood, commenced on Monday morning. The details have little interest, as the public are already acquainted with the facts adduced in evidence. The prisoners were sentenced to various terms of imprisonment, varying from one to six months. The Recorder, in addressing the Jury, took occasion to remark that the results of the trials at the present and preceding sessions had shown that the parties engaged at the recent riots did not belong to the poorest classes of society. They were generally persons in good employment, who should have been content with the wages which they received, but who had, in a great many instances, subscribed towards the Trades Unions. They had aggravated greatly the distresses under which the working classes laboured, and they would always be the sufferers from such illegal combinations.

Stafford.—The district of the Potteries has remained perfectly quiet during the past week, and work has been generally resumed, although there do not appear to be any manifestations of improvement in trade. The authorities and respectable inhabitants in each town are seriously considering what precautionary measures will be best adapted to prevent any recurrence of outrages similar to those lately perpetrated. It is affirmed that steps are now taking in order to provide temporary barracks for the military during the ensuing winter, and that Government purpose erecting new barracks in the neighbourhood early in the spring.—The papers announce that the special commission for this county will be opened on Saturday, the 1st October, and that the trials will commence on the 3d. Chief Justice Tindal will preside. Upwards of 200 prisoners are now in custody, committed for various offences relating to the destructive riots in the Potteries and to the disturbances in the south of the county, who will be tried under the special commission, besides those who are out on bail on similar charges.—There was a slight attempt at riot on Friday, in the neighbourhood of Wednesbury. A party of the thin coal miners resolved upon compelling those who had resumed work to leave their employment, and proceeded to some pits for that purpose. A troop of cavalry, however, speedily dispersed the rioters.—The meeting of coal-masters and men at West Bromwich last week has been productive of the happiest results.—On Monday, the prisoner Ellis, the ringleader in the late outrages, was brought before the magistrates at Newcastle-under-Lyne, and after a long examination was committed to take his trial on a charge of high treason.

Leeds.—The magistrates of this town have unanimously passed a vote of thanks to Major-Gen. Brotherton, Prince George of Cambridge, and the officers and privates of the 17th Lancers, for their efficient conduct and moderation when aiding the civil power to preserve the public peace, and to protect property within this borough during the late disturbances. The inhabitants of Bradford have presented a similar testimony to Col. Love and the officers of the 73d regiment.

Dover.—Some excitement has been caused here by the proceedings of the magistrates and gaoler in regard to Messrs. Fitzjames and Gladstone, the comedians. It appears that for some alleged offence they were held to bail and detained in prison for a few hours until their bail arrived, and that during this time the gaoler ordered their hair to be cut off. The proceeding, of course, has not been allowed to drop, and Sir J. Graham has sent down a gentleman to investigate it.

Liverpool.—A calamitous fire broke out on Tuesday near the Princes' Dock, in a large bonded warehouse in Galton Street, the property of Sir John Tobin. The upper stories were filled with cotton, coffee, sugar, and rice, and the vaults were stored with palm oil, turpentine, and rum. The fire broke out soon after 5, and spread with great rapidity. At 8 the roof fell in, and there was considerable danger that the flames would spread, but by great exertions they were confined to the premises. It is stated that the loss of property, exclusive of the warehouse, will amount to 15,000*l.* Another account states that, including the building, the loss will not exceed 20,000*l.* The warehouse was fully insured, and it is believed that most of the goods were covered by policies.

Norwich.—The triennial festival commenced on Monday by the performance of the customary rehearsal. The orchestra is formed of the leading instrumentalists from the metropolis; whilst the choral band, numbering nearly 300 persons, are from the different choral associations in the town and neighbourhood. The principal vocalists are Madame Caradori Allan, Signor Pacini, Miss Hawes, and Miss Rainforth; Mr. Hobbs, Mr. Phillips, Mr. Balfe, and Signor Rubini. Mr. F. Cramer leads, and Professor Taylor conducts. The selections for the evening concerts include the favourite overtures of Mozart, Spohr, Weber, and Cherubini, and the best known symphonies of Beethoven, Mozart, and Haydn. Some portions of the oratorio of Samson were first tried, and the conductor then gave the note of preparation for the Fall of Babylon. The most earnest and eager attention was at once visible in the band, as they prepared to give its first audible existence to this work of Spohr. Previously to giving the signal for its commencement, the conductor reminded his troop of the honourable and important duty which then devolved upon them; that the work which they were about to rehearse was wholly unknown to the public either by publication or performance, and the first impression of its merits would be given by the band he had then the honour to address. In this fact was emphatically given its composer's estimate of their collective and individual talents—for Spohr had cheerfully consented to place his reputation in their hands, in consequence of his experience of their zeal and ability. The rehearsal then commenced, and proceeded satisfactorily. The good effects of the previous training were abundantly visible, for the spirit and precision with which the parts were sung and played could only have resulted from much previous practice. The first evening concert on Tuesday passed off with great success. On Wednesday the Creation of Haydn, with a short miscellaneous selection from the works of Handel, Purcell, and Rossini, formed the first morning performance of this Festival. The oratorio was admirably presented, the members of the chorus executing the concerted music in a high style of perfection. On Thursday Spohr's new oratorio, the Fall of Babylon, was performed, with complete success. Nothing could have surpassed the enthusiasm with which it was received, and the performance is described as excellent. We reserve the details until next week.

Pembroke.—The launch of the Superb, 80-guns, took place last week from her Majesty's dockyard at this port. She is said to be a magnificent ship. The interest excited by the event was so great that all the inns were full, and many were unable to find accommodation. The ship glided off the stocks without the occurrence of any accident. Her burthen is 2583 tons; her extreme length, 190 feet; extreme breadth, 57 feet. The mould-loft in the dockyard was fitted up as a bazaar and fancy fair, the proceeds of which were appropriated for the erection of a national school.

Plymouth.—The Archduke Frederick of Austria, who distinguished himself during the naval operations on the coast of Syria, under Sir R. Stopford, has arrived at this port on his way to Windsor, to pay a visit to the Queen. On Monday his frigate came into the harbour from the Sound, and in the course of the day his Imperial Highness visited the guard-ships and the dockyard under the customary salutes. In the evening, the Archduke dined at the Port Admiral's, where a select party of naval and military officers were invited to meet him. His Imperial Highness was accompanied by five of his own officers. On Tuesday, the Archduke and several officers revisited the Dockyard. Being in undress, there was no guard of honour. They inspected the tilt hammer, went to the new north dock, viewed the Albion, and the process of coppering her, and then proceeded to the mast-house. After going through that building, His Imperial Highness took his departure, expressing to the Admiral his extreme pleasure and gratification at everything he had witnessed.

Preston.—The festivities of the guild have gone on with great spirit since our last report, and the town was a scene of more than ordinary gaiety during the latter part of last week. Among the numerous robberies which are always committed on such occasions, that of Mr. Marquis of Accrington was the most serious. It appears that Mr. Marquis some time since sold property to Mr. Hargraves of Accrington, for 10,000*l.*, a portion of which, to the amount of 2,000*l.*, he happened to have in his pocket, on the first-day of the guild, which he had come to Preston for the purpose of witnessing. In the course of his walk through the town he entered into conversation with some unknown persons whom he accidentally met, and soon afterwards discovered that his money had been stolen. On Saturday night two persons, a man and a woman, were apprehended on suspicion by the metropolitan police, in an obscure place in Lambeth; none of the stolen notes were found, but the prisioners were remanded for further examination.

Southampton.—The Hindostan, new steam-ship, of 2,000 tons and 520 horse-power, which has attracted so much attention at Liverpool and Dublin, arrived at this place on Saturday morning, having made the passage from Dublin in thirty-eight hours—one of the most rapid passages on record. She is an object of as much attraction here as she has been at other places. On Tuesday the directors of the Peninsular and Oriental Company gave an entertainment on board her to a large party of their friends, among whom were the Chancellor of the Exchequer, Sir E. Codrington, Admiral Hyde Parker, Sir James and Lady Lushington, the Spanish Minister, and several directors of the East India Company and the South-Western Railway Company. A special train of six carriages started with the visitors from the Vauxhall terminus a little before ten o'clock, and arrived at Southampton about half-past twelve. On their arrival, the vessel got under weigh and proceeded towards the Needles, when she bore up and returned to Ryde. During this voyage the party partook of a cold collation, Sir J. Campbell in the chair, after which several speeches were delivered. Sir E. Codrington, in returning thanks on behalf of the Navy, said he was of opinion that in the course of time steam would be introduced into every ship in the Navy. The Chancellor of the Exchequer returned thanks on behalf of ministers. He said it was the intention of several of his colleagues to have been present at that meeting, but circumstances over which they had no control had prevented them. They would have felt it a duty to have given encouragement to that great enterprise which, while it promoted the employment of English capital, was the means of extending the rapidity of intercourse all over the world; and more particularly because this splendid vessel was destined to keep up a more close connexion between England and her Indian empire. The ship landed her passengers at Southampton in the evening, and most of the visitors returned by a special train to town.—The British Queen, Belgian steamship, sailed on Sunday for New York. She carries out 74 passengers. This is to be her last trip this season. She will recommence running early in the spring, and, during the interval, will be sent to London to be docked, where her length will be reduced by forty or fifty feet.

Sunderland.—On Wednesday last an American seaman, named Michael Smith, performed the feat of leaping from the bridge over the Wear into the river, a height of upwards of 110 feet. On reaching the water he struck out, and swam to a keel or barge, from whence he saluted the spectators on the bridge and on the heights in the style of a true jack tar, which was immediately returned by a round of hearty cheers from the astonished multitude. The bridge is so constructed that vessels of 400 tons sail underneath it without striking their masts; and the feat appeared so impracticable that the police had orders to prevent the man from making the attempt. He contrived, however, to elude their vigilance, but was apprehended immediately after he landed.

Yeovil.—The glovemakers of this town, and some places in Somersetshire, recently gave a public dinner to Mr. Thomas Ensor, and presented him with a tea equipage of silver, in return for the services which he had rendered to the glove trade in general, by obtaining from Government a modification of the New Tariff. The question was one of great interest, involving the fortunes of a large district of the West of England. It appears from the report in the "Sherborne Journal," that there was originally a clause respecting the glove trade in the New Tariff which gave great dissatisfaction to the operative glovemakers in the West of England, and that by the efforts of Mr. Ensor it was considerably altered and modified before it passed through Parliament. He obtained an alteration of the duties on French gloves at first intended, and induced the Government to fix those duties at a rate which will protect the home producer. He asked a duty of 4*s.* per dozen pairs of French gloves; and at length the Government consented to the duties of 3*s.* 6*d.* per dozen pairs of men's gloves, and 4*s.* 6*d.* per dozen pairs of women's gloves. This was the same thing as the medium for which the glovemakers asked. The dinner to commemorate this occurrence has caused some interest in Somersetshire and Dorsetshire, and the result obtained is considered to promise increased benefit to the manufacturing interests of both counties.

Railways.—The following are the receipts of railways for the past week, viz.:—Birmingham, 16,151*l.*; Great Western, 13,959*l.*; Blackwall, 1,139*l.*; Greenwich, 756*l.*; Birmingham and Gloucester, 1,847*l.*; York and North Midland, 2,188*l.*; Midland Counties, 2,808*l.*; Edinburgh and Glasgow, 7,593*l.*; North Midland, 4,485*l.*; Brighton, 4,353*l.*; Eastern Counties, 1,088*l.*; Manchester and Leeds, 4,773*l.*; Croydon, 351*l.*; South-Western, 7,283*l.*; South-Eastern and Dover, 1,224*l.*; and Northern and Eastern, 1,411*l.*—The half-yearly meeting of the Croydon Railway Company has taken place. The report stated that the improvement which the Directors anticipated in the income of the Company, during the last six months, had not been realised, the total revenue having been nearly stationary. The sum standing to the credit of the Company, after deducting charges for repairs, maintenance of way, and the interest in bonded debts, was not sufficiently large to warrant a dividend. The high rate of toll of the Greenwich Company, the slow development of the Brighton traffic, and the high rate of fare maintained by that Company, which had the effect of diminishing the number of passengers, had contributed to this disappointment. A satisfactory toll agreement had been entered into with the South-Eastern Company, but the Greenwich Company still refused to enter into a similar agreement. The arrangement with the South-Eastern Company for the amalgamation of the locomotive power was satisfactory, and an act of Parliament for making a branch railway to a station near the Bricklayers' Arms, so as to form a West-end terminus, would be applied for in the ensuing session. The expenditure for the half-year amounted to 17,517*l.*, the receipts to 19,415*l.*, leaving a balance of 1,897*l.* After considerable discussion, a resolution was passed, empowering the directors to raise a further capital of 66,000*l.*, occasioned by excess in the expenditure upon the works, and the land slips upon the line. A proposal for leasing the railway for a term of seven years was made in the course of the day's proceedings; but the proposition was not seconded, and consequently fell to the ground.—The half-yearly meeting of the West London Railway Company was held to day, when it was announced that the whole of the simple contract creditors had agreed to accept shares in the undertaking in satisfaction of their claims, provided the shareholders in general covenanted to raise sufficient additional capital, by October next, to proceed with the works towards completion. From what transpired at the meeting, it seems that 140,000*l.* have already been expended on the project, and that 47,000*l.* more is required to carry it forward, and place it in a position to give some return to the company. The works, it is understood, are in a dilapidated condition; but it would require, it appears, no extraordinary exertion to place them, when the new capital is raised, in a state satisfactory to all parties who have embarked money in the undertaking. This 47,000*l.* is proposed to be collected by the issue of new shares, to the amount of 32,000*l.*, at 10*l.* each, with all the character of the original shares, and the additional preference of a dividend of 1*l.* per share, to be paid to the holders of them before any other division of profits takes place; the remaining 15,000*l.* to be raised by means of debentures. Among the proprietary there appears to be a desire to carry out the railway, and many who were present subscribed their names for a large proportion of the new shares. A deputation is also to wait on the other London and the Manchester shareholders, in order to obtain a general co-operation for effecting the completion of the line. The operations of this company have long lain dormant, from the want of a proper understanding between the creditors and the directors; but it may now be hoped that some further progress will be made.—In regard to the recent meeting of the Manchester and Leeds Company, it appears that the Manchester and Birmingham Company propose a junction, and that the Committee to consider the proposal is appointed at the request of the Directors, in order that no delay might be occasioned in effecting so desirable a conclusion. The total required on the works of the Company is estimated at 1,890,000*l.*, which sum will include about 50,000*l.* already expended on that portion of the Manchester station to be occupied by the Sheffield Company. As about 1,763,000*l.* is the amount at present absorbed, 126,000*l.* further capital is required.—Mr. Stephenson, the engineer, has lately visited the neighbourhood of Wallingford, for the purpose of making some further preliminary survey for the intended line of junction between the Great Western Railway and Oxford, and principally, it is said, with a view to alter his first projected line, which was intended to have been entirely kept on the Oxfordshire side of the Thames. It is expected that the University will co-operate in the undertaking, and that an Act will be introduced as soon as Parliament re-assembles.—The gross traffic receipts for the week ending Thursday, September 8, on the London and Dover Railway, was:—First class, 1,299; second class, 3,036; third class, 1,633: total, 5,968—1,219*l.* 4*s.* 7*d.* Merchandize, &c., 5*l.* 4*s.*—total receipts, 1,224*l.* 8*s.* 1*d.*—The Northern and Eastern Railway Company have made a material reduction in their fares to Lea Bridge, Tottenham, Ponder's End, and Waltham. They have also established an omnibus to carry passengers to and from the railway trains in High-street, Shoreditch, to the Mansion House, at the novel rate of 2*d.* per passenger. From that place the public can, of course, find conveyances to every part of London, and the object of the Company would appear to be to give cheap travelling a fair trial.

IRELAND.

Dublin.—The Lords Justices have received the Queen's letters empowering the Lord Chancellor or Keeper of the Great Seal to issue letters patent appointing J. D. Jackson, Esq., a Justice of the Common Pleas, in the room of Mr. Justice Foster, deceased; and T. B. C. Smith, Esq., Q.C., to be Solicitor-General, in the room of Mr. Jackson, promoted to the bench.—An unexpected difficulty is said to have arisen in regard to the Bishopric of Meath, in consequence of the illness of Judge Torrens, one of the Commissioners appointed to hear the appeal in the case of the disputed Deanery of St. Patrick's. A new Commissioner must, consequently, be appointed, and it is expected that they can hardly assemble before November, so that if Government are determined to wait until the decision of the Court of Delegates, in regard to the Deanery, the new Bishop of Meath cannot be appointed until towards the close of the year.—At the late meeting of the Dublin and Drogheda Railway Company, the half-yearly accounts, and the declaration of the forfeiture of certain shares upon which calls have been neglected to be paid, were brought forward. The works, according to the directors' report, are proceeding satisfactorily, and it appears to be hoped that they will be completed nearly within the estimates of the engineer. A prominent fact in corroboration of this was, that whereas the engineer's estimate for iron was 12*l.* per ton, a contract for supply had been made at 7*l.* per ton. The receipts for the half-year were stated at 39,276*l.* and the expenditure at 33,874*l.* 9*s.* 8*d.*—A deputation from the Senior Fellows, and a large portion of the constituency within the College, had a long interview with Lord Eliot, on Saturday, to remonstrate with his Lordship on the impolicy of persisting in the present contest for the representation of the University; but his Lordship did not yield to the remonstrances urged. Mr. George Hamilton's committee continues to meet daily.

SCOTLAND.

The Queen's Visit.—As we announced in our last, Her Majesty left Scone on Wednesday morning for Taymouth Castle. Shortly before her Majesty's departure, a deputation from the magistracy of the city went to Scone Palace, for the purpose of soliciting her Majesty and Prince Albert to honour the city by enrolling their names in the Guildry-books, which request was most graciously and promptly granted. Sir R. Peel took the opportunity of expressing to the deputation, in very flattering terms, his high opinion of the very admirable manner in which everything had been conducted for the reception of her Majesty at Perth. He likewise added that her Majesty participated in the highest degree in the same feelings. The Queen and Prince entered their names in the Guildry-books as follows:—"'Dieu et mon Droit' Victoria R.; Scone Palace, Sept. 7, 1842." "'Treu und Fest;' Albert; Scone Palace, Sept. 7, 1842." Shortly after eleven, the Queen took her departure. The road to Dunkeld was lined with people, and the hills were crowded. On Birnam heights were planted various national banners, and Dunkeld was full of bustle and excitement during the forenoon. The Royal party arrived about one o'clock, when they were received with true Highland enthusiasm. The Athol Highlanders, in number from 1500 to 1600, with their claymores and battle-axes, had an imposing effect, and everything must have given her Majesty a favourable idea of the Highlands. The Queen partook of a *déjeûner* in the park, Lord and Lady Glenlyon doing the honours in the absence of the Duchess of Atholl, who was unable to attend upon her Majesty from old age and infirmities. At 3 the Royal party left for Taymouth, where they arrived shortly before 6. The cheering of the many thousands who lined the road along which the procession passed, rolled on to the vast multitude assembled on the lawn, who joined in a Highland hurrah, which made the surrounding hills re-echo. When the Queen alighted at the Castle, a Royal salute was fired; and the Royal standard substituted for the Breadalbane flag on the tower. The Breadalbane Highlanders were ranged on the lawn in front of the Castle, and the Marquis stood in front, about 150 yards in advance of his men. As soon as the Queen approached, the Marquis called out, "Highlanders, attention!" and all followed the Marquis in giving the salute. When her Majesty entered the Castle, she was conducted to the balcony by the Marquis, when the Highlanders gave nine hearty cheers. Her Majesty and Prince Albert soon afterwards made their appearance, when the cheering was again resumed, and graciously acknowledged. In front of the Castle there were platforms erected, where Highland dances took place by torchlight after dinner, and her Majesty witnessed them from the balcony. On the lawn were the words, "Welcome, Victoria and Albert," in transparent lamps, which had a magnificent effect. The fort on the hill, opposite the Castle, was covered with variegated lamps, and bonfires blazed on every promontory. Many of the trees were hung with lamps, which gave the grounds quite the effect of a fairy land. Mr. Menzies, Mr. Fox Maule, Mr. Campbell of Front, and many other gentlemen joined in the dance, which was wholly confined to the kilted visitors, and to the reel of *Hullachan* principally, till eleven P.M. On Thursday morning, at a few minutes past nine, Prince Albert started for the hills. He was mounted on a chestnut pony, and dressed in a black velvet shooting coat, shepherd's plaid trousers, shoes and gaiters, and attended only by the Marquis of Breadalbane. He proved himself a good shot, for he returned to the Castle about three o'clock, after having, with his own hand, shot nineteen red-deer, besides hares, rabbits, grouse, black-cock, and capercailzie. On this occasion, the papers say, it was amusing to see the meeting of persons of different political parties. Sir Robert Peel and Mr. Fox Maule were seen galloping away to the hills together; and their servants being out of the way, Mr. Fox Maule held Sir Robert's horse till he mounted. In the afternoon, her Majesty and the Royal party took a short drive to Kenmore, and round the Marquess's grounds on the Tummel Bridge road. On Friday the Prince again went to the hills grouse shooting, but the sport was indifferent owing to the weather. In the afternoon there was a gathering of the Breadalbane clan, headed by Mr. W. J. Campbell, of Glenfalloch, Lieutenant-Colonel. Sir Alexander Campbell, Bart., commanded the Lochaber axes, which formed the rear-guard. The display of pennons, &c., was exceedingly imposing. At her Majesty's request, the Highlanders then arranged a dance, and eight reels were given in excellent style, under the direction of Major Campbell of Melfort. The Queen and Prince witnessed them from the terrace, attended by the Marchioness of Breadalbane, the Duchesses of Buccleuch, Sutherland, and Roxburgh, and the Marchioness of Abercorn. The Marquis of Breadalbane, the Duke of Buccleuch, Duke of Roxburgh, Sir R. Peel, the Earls of Aberdeen, Morton, Kinnoul, Mansfield, and Liverpool, Lord Belhaven, and many other personages of rank and distinction were on the ground to witness the interesting sight. At the conclusion of the reels, John M'Alister, one of the Marquis's pipers, by way of interlude, danced what is called the sword dance, "*Gille callum*." Mr. Fox Maule officiated as Master of the Ceremonies. At the termination of the dance her Majesty retired from the terrace, and drove out in company with Prince Albert. On her road she was loudly cheered by the hundreds who beset all the avenues to the castle, in the hope of obtaining a passing glimpse of the Royal person. Her Majesty was designated the "Bonny lassie" by her warm-hearted subjects in this part of the Highlands; and the happiness of those who saw her was indescribable. A ball, to which 100 persons were invited, closed the evening in the most brilliant manner. The Highland reels were danced by the Marquis of Breadalbane, Mr. Fox Maule, and Mr. Campbell. The "Rill Thullacan" was danced by Mr. Fox Maule, Mr. Davidson of Tulloch, Mr. Menzies of Chesthill, and Mr. Cluny Macpherson. The Queen led off a country dance with the Duke of Buccleuch, Prince Albert dancing with the Duchess of Sutherland. The grounds on the occasion were illuminated as beautifully, but not so extensively, as on the night of her Majesty's arrival. Among the mottoes the largest and most conspicuous, arranged on a slope of the lawn, contained the words "Welcome, Victoria and Albert." This was placed directly in front of her Majesty's apartments, and had a fine effect seen from the Castle. The trees opposite the mansion were hung, as on the night of her Majesty's arrival, with variegated lamps; a portion of the castle was also illuminated. On Saturday previously to her Majesty's departure, she proceeded with Prince Albert and the Marquis and Marchioness of Breadalbane to the park, on the eastern side of the castle, where her Majesty, in presence of the illustrious party planted two trees, an Oak and a Scotch Fir, in commemoration of her visit. Her Majesty is said to have handled the spade with the skill of an experienced gardener. Mr. Dewar, the head forester, attended on the occasion; the small mahogany spade had the handle encircled with crimson velvet, and no doubt will be long preserved as a valuable relic. As soon as her Majesty had finished, Prince Albert planted an Oak and a Scotch Fir near the other trees. Her Majesty and the Prince then drove to the place of embarkation, a few hundred yards below Kenmure Bridge. The barge of her Majesty, which had the Royal standard hoisted at the bow, was rowed by eight men, and steered by Captain M'Dougall, R.N. All the seats were cushioned with the Breadalbane tartan, and those in the stern sheets were fringed with gold; the cushions set apart for her Majesty were covered with velvet of the Breadalbane tartan, the drapery in front was of brown satin, on which the emblem of the Breadalbanes—a boar's head—was beautifully embroidered, along with a wreath of thistles. As the barge glided through one of the arches of the bridge into Loch Tay, the crowd assembled on the bridge cheered with great enthusiasm. The Loch Tay barge followed, steered by Lieut. J. Campbell, R.N., in full uniform, and wearing an Acre medal. In this barge were the Duke of Buccleuch, the Duchess of Norfolk, the Earls of Morton and Liverpool, and Lord Belhaven. The third barge, steered by Lieutenant Patrick Campbell, R.N., contained the Earl of Aberdeen and the Hon. Fox Maule. A fourth barge succeeded, in which were Sir Robert Peel and others. As the flotilla swept past two barges of Lord Breadalbane, moored a short way above the bridge, a salute was fired from the battery on the westward of the castle, which reverberated among the hills, and had a fine effect. Altogether, it is said, that this was one of the finest spectacles connected with the Royal visit, and formed a meet conclusion to the festivities of Taymouth Castle. The assemblage collected on the bridge lingered on for a considerable time, regarding the progress of her Majesty amidst the wooded hills on either side. A short way up from the bridge the view opens and discloses the mountain scenery to the westward, amidst which the Royal party proceeded to Achmore, a seat of the Marquis of Breadalbane, where they had luncheon. The Highlanders had been despatched on their march to this point at five o'clock in the morning, for the purpose of forming a guard of honour. After partaking of a luncheon at this seat, her Majesty and Prince Albert took a kind leave of their noble host and hostess, and proceeded, with their suite, in carriages to Drummond Castle.

Drummond Castle.—Her Majesty reached Crieff about six P.M., preceded by a body of tenantry on horseback; and shortly afterwards arrived at Drummond Castle, the avenue of which was lined by 500 of the tenantry on horseback, along with a much greater number on foot. At the entrance of the Castle, a body of the 42d were drawn up as a guard of honour, and upwards of 100 Highlanders, in the Drummond tartan, completed the escort. Her Majesty's carriage had been closed, after passing through Crieff, in consequence of the state of the weather, and the approach of the evening. There was great cheering along the whole avenue, which was, if possible, redoubled on her Majesty's alighting from her carriage. Lord and Lady Willoughby D'Eresby received their Royal guests at the entrance, and conducted them into the Castle. On passing through Crieff, her Majesty and Prince Albert both appeared somewhat fatigued after their journey. In the evening Crieff was brilliantly illuminated, and there was a display of fireworks in honour of the event. Numerous bonfires blazed on the adjoining hills. On Sunday morning her Majesty attended divine service, which was performed in the Castle, the Rev. James Daniel Giles, chaplain to Lord Willoughby D'Eresby, officiating on the occasion. Unfortunately, as the day advanced the weather became extremely unfavourable, so much so, that it prevented her Majesty from taking her accustomed ride. It rained incessantly until past midnight. On Monday the Queen reviewed the Highlanders of the Drummond Clan; the Prince went to Glenartney Forest for a day's deer-stalking, and killed a buck and three hinds of the red-deer species. In the evening there was a ball. On Tuesday morning her Majesty and suite took their departure from Drummond Castle for the ducal palace at Dalkeith. At Stirling, her Majesty stopped for a short time to inspect the venerable castle and its fortresses. Upon the arrival of the royal *cortége* at Allan Bridge, a short distance from Stirling, it was met by the Lord Provost and magistrates of the burgh, who presented the keys of the city to her Majesty, and afterwards accompanied the Royal carriages to the Castle, where Sir George Murray, the Master-General of the Ordnance, was in attendance to escort her Majesty over that ancient pile. Triumphal arches were erected in various parts of the road where the Queen passed. The Royal party passed through Edinburgh on their return at half-past 4 in the afternoon, and reached Dalkeith soon after five.

Edinburgh.—Her Majesty having returned to Dalkeith on Tuesday, the Lord Provost and Town Council proceeded to the palace on Wednesday, and presented the freedom of the city to Prince Albert, the Duke of Buccleugh, Lord Aberdeen, and Sir R. Peel. On Thursday morning, her Majesty left Dalkeith for Granton Pier, and embarked about 9 o'clock in the Trident, belonging to the General Steam Navigation Company, for London. The Rhadamanthus government steamer, with the suite, preceded her Majesty's departure by some hours. The other steamers and the yacht were ordered to follow. From the great size and power of the Trident, it is expected that her Majesty will arrive at Woolwich some time in the course of this day.—The organs of the Scotch church are busily engaged in discussing the conduct of her Majesty in not attending divine service in the High Church on Sunday week. These writers look upon it as a slight offered to the establishment, and consider their opinion to that extent to be confirmed by the fact that her Majesty had service performed in Dalkeith palace by a clergyman of the Scotch Episcopal Church, and not by one of her own chaplains of the Established Church of England. The subject is commented on with some warmth; but the moderate party in the kirk condemn the whole proceeding as highly intolerant and indiscreet, and claim for her Majesty as complete a freedom in religious matters in Scotland, as the leaders of the ultra-church party would desire to secure to themselves if resident in England.—Another strange inadvertence has been committed by the authorities, in regard to the proposed invitation of Prince Albert to a public dinner. The measure was not carried without much opposition, and the invitation, it seems, was then forwarded by the penny post.

Glasgow.—A placard has been posted on the walls of this city, stating that a warrant has been issued by Government for the apprehension of "Peter Murray M'Douall, late of Ramsbottom, near Bury, surgeon, but better known as Dr. M'Douall, a Chartist lecturer," and offering a reward of 100*l.* to any person who shall give such information as will lead to his apprehension. This appears to have been done by Government at the instance of the Manchester police authorities, as the name of Sir C. Shaw appears in the bill as the person to whom information is to be given.—The Glasgow, Paisley, and Kilmarnock Railway have declared a dividend of 17*s.* 6*d.* per share, besides establishing a depreciation fund, and carrying over a surplus to the balance of undivided profits. The directors recommend economy, and have, as an example, reduced their own allowance from 600*l.* to 400*l.* a year, in consequence of a proportionate decrease in their staff. The traffic of the line, like that of other railways in the country, has suffered from the depression of trade.

THEATRICALS.

Covent-Garden.—Although London is now empty, and the West-end presents no signs of life, this theatre opened on Saturday to a full house, with "Norma," and a new two-act comedy, entitled "Gertrude's Cherries," by Mr. Douglas Jerrold. On a performance so familiar to the public as "Norma," it is needless to dwell. Miss Kemble had not thoroughly recovered from her indisposition, and her voice was not quite in her power, while her acting seemed better than on any former occasion. She had more than her usual grace and energy. Miss Rainforth sang "Adelgisa" as sweetly as ever, and the opera is improved by making S. Giubelei the representative of *Oroveso.* At the conclusion, Miss Kemble appeared, led on by Mr. Cooper, in reply to the vociferous demands of the audience. The curtain then rose for "God Save the Queen," sung by Miss Poole and the opera company, with the exception of Miss A. Kemble. The new piece was committed to the care of Messrs. Bartley, W. Lacy, Diddear, Harley, Meadows, A. Wigan, Miss Cooper, Mrs. Humby, and Mrs. W. Lacy. *Guibert* is the son of *Willoughby*, and has been supposed to have fallen on the field of Waterloo, having previously quarrelled with his father and run away. *Gertrude*, who in the first scene sells some cherries to *Willoughby* and his grandson *Vincent*, on a visit made by the latter to Waterloo, is *Guibert's* daughter; and as a matter of course, the first cousins fall in love, to the great annoyance of *Willoughby*. An explanation ensues, everybody is reconciled, *Vincent* marries *Gertrude*, *Willoughby* embraces *Guibert*, and the comedy ends. *Jack Halcyon* was well played by Mr. Harley, who made the most of his part, though he did not seem at home in it. *Mr.* and *Mrs. Crossbone*, a City undertaker and his wife, were well drawn, and well acted by Mr. Meadows and Mrs. Humby; while the *Alcibiades Blague* of Mr. Wigan deserves honourable mention, as a good specimen both of the Frenchman and the guide, according to the stage acceptation of the terms. The drama, however, has not in it the seeds of popularity, and would, but for the acting, have been early condemned. It is by no means such a comedy as might have been expected from so practised a hand as its author.

On Monday, a new play in five acts, entitled "Love's Sacrifice," by Mr. Lovell, the author of the "Provost of Bruges," was produced at this theatre with complete success. The following is the plot:—*Matthew Aylmer* (Mr. Vandenhoff) and *Paul Lafont* (Mr. Cooper) are rival merchants, the latter of them being a suitor for the hand of *Margaret* (Miss Vandenhoff), daughter of *Aylmer*. *Margaret*, however, has fixed her affection on the *protégé* of her father, *Eugene de Lorme* (Mr. C. Pitt). This young man is the son of the murdered *Count de Lorme*, and has been originally left with his sister, the widowed *Herminie de Vermont* (Mrs. W. Lacy), to the guardianship of *Lafont*, under whose care their property has dwindled into nothing. In addition to these characters, we have the lover of *Herminie de Vermont*, a young spendthrift called *St. Lo* (Mr. W. Lacy), who has come to ruin; two friends, *Morluc* and *Du Viray*, with a certain mysterious friar named *Dominic* (Diddear), and a clerk of *Lafont's*, called *Jean Rusé* (Meadows), together with *Manou* (Mrs. Orger), a housekeeper—who assist in the comedy of the piece. *Aylmer* loves his daughter too much to give her up to the wealthy *Lafont*, and destines her for him she loves. Hurrying away, enraged at his rejection, the merchant's rival finds a tool for his revenge in the friar *Dominic*, who tells him the tale of the *Count de Lorme's* death, with the additional fact that his murderer, the *Count de Barré*, yet lives in the person of *Matthew Aylmer*. The vindictive suitor demands a private interview with the father, from whom, after disclosing enough of the tale told him, to hint the whole, he demands his daughter's hand. Stricken by the sense of his discovered crime, the unhappy parent sinks in the arms of his child, who has again entered with *Eugene*. *Lafont* reiterates his suit, is contemptuously rejected by the daughter, but with a word and look brings the murderer to his knees, and demands *Margaret's* presence alone in an adjoining chamber. She follows him, leaving *Aylmer* half senseless in the presence of the astonished son of his victim, *de Lorme*. Painful as this interview has been, the interview between the wooer and the maiden is still more thrilling. With remorseless will, *Lafont* exposes the father's crime to his daughter, and requires her sacrifice of herself as the purchase of her parent's life. In her grief and agony she half consents, but requires time. She then learns from her father that the charge of murder is true, but not all true. He has slain *de Lorme*, in self-defence, at a moment when both were maddened by the death of *de Lorme's* wife, whom each had loved. But he is determined that his daughter shall not purchase with her misery his exemption from shame or the scaffold. *Margaret*, however, has resolved to save her father, and, tearing herself from his determination, she repairs to *Lafont* to sign the contract, and consummate the sacrifice of that love for her parent from which the drama takes its name. *Dominic* is present to officiate as priest, but, unbidden, he has summoned *Eugene* and *Herminie* as witnesses. The entreaties of the first avail not to change the resolution of the girl, when *Aylmer* enters the apartment, and forbids the marriage. With the determination to save him, even in his own despite, *Margaret* seizes the pen and signs the contract, while her father, determined to protect her from the misery of wedding *Lafont*, and knowing that the latter will have no regard for the portionless daughter of a proclaimed felon, openly avows his guilt. Here, however, the tide of fortune turns, and in the supposed *Dominic* appears *de Lorme* himself, who reconciles himself to *De Barré*, and produces, in the received way, the usual happy terminations. Some previous villany has most opportunely put *Lafont* within reach of the law, and, consequently, "vice is punished, and virtue rewarded," according to theatrical propriety. It will be seen from this sketch that the whole has been brought together with great tact. Indeed, some of the latter scenes were so laid that their success was certain. The plot bears an evident resemblance to that of the "Iron Chest," and Mr. Vandenhoff's acting recalled very forcibly his representation of *Sir Edward Mortimer*. His part was well conceived and powerfully worked out. Some of the scenes with his daughter and *Lafont* were exceedingly impressive, and received merited applause. Miss Vandenhoff sustained her part with a feeling which showed that she entered heartily into the scene. The other parts were generally well filled, and the piece was announced for repetition amidst such unequivocal applause, as bespoke the sympathies of the audience, and promised that it will remain a favourite for some time to come. The opening of the season has thus taken place under circumstances which promise well to the public, and hold out the hope that Mr. C. Kemble will be enabled to keep up the character of a theatre which is associated with the memory of the most distinguished members of his family.

Miscellaneous.

CORRESPONDENCE BETWEEN MR. RENNIE AND THE NEW ZEALAND COMPANY.

Extract from the Colonial Gazette of the 17th August.

NEW SETTLEMENT IN NEW ZEALAND.

London, 28th July, 1842.

Gentlemen,—The public expect that the Directors of the New Zealand Company, while seeking to secure the interests of their shareholders, by realising an adequate return upon the capital employed, will not limit their operations to trafficking in land, but will act in the capacity of national agents for promoting the colonization of New Zealand, and for applying upon an extended scale, and under the improved arrangements which experience may now suggest, the saving principle of defraying the cost of emigration by means of the value which the peopling of a new country confers upon its land.

Participating in this expectation, I address myself to your Court, with the twofold object of stating the grounds of our conviction that there exists at the present moment an urgent necessity for making immediate preparations for conducting an extensive emigration from this country to the Colonies, and of submitting for your consideration the outline of a plan in which a body of persons whom I represent on this occasion are desirous of engaging, for founding, under the auspices of the Company, another settlement in New Zealand.

After calmly surveying the various remedial measures which have been either adopted or proposed for removing the causes of this distress, we have arrived at the conclusion that extended colonization affords the only means by which the causes of the distress which has overspread the country can be permanently abated. To remove without transferring distress, to preserve the peace of the country, to save the institutions of England from being swept away in an uncontrollable rebellion of the stomach, it is necessary that we should resort to some immediately-effectual means of providing for the unemployed and destitute masses. But in what way can immediate relief be afforded? To this momentous question, in our opinion, only one answer can be given: convey the unemployed labour of the United Kingdom to the unoccupied lands of the Colonies; adopt an extensive scheme of systematic colonization.

The adoption of an extensive plan of colonization would afford instantaneous relief: it would occasion an immediate increase in the demand for shipping, and for all the various materials required for the equipment and maintenance of the emigrants; and while it thus enlarged the field of employment, it would diminish the number of hands seeking to be employed. But though the conveyance of a portion of our unemployed population to the unoccupied lands of the Colonies affords, we think, the only effectual means by which markets can be opened, and the causes of distress removed, yet it does not appear that the Executive Government is prepared to originate any extensive plan of emigration. It may even be questioned whether, in a movement of this character, Government should take the initiative. An extensive scheme of emigration, if adopted in the first instance as a Ministerial measure, might be rendered unpopular by being represented as compulsory, and might be cried down by the ignorant and prejudiced as a species of transportation; while, were it undertaken by a public company, it would be less open to such unfounded objections, and would be presented more in the character of a voluntary and spontaneous movement on the part of the people themselves.

Having thus endeavoured to explain the grounds of our conviction that it has become indispensably necessary, as regards the mitigation of distress, the preservation of the public peace, and the security of life and property, that immediate arrangements should be made for the adoption of an extended scheme of emigration,—and being of opinion that, in the present state of public feeling, it is expedient that such arrangements should originate with an incorporated company rather than with the Executive Government,—we now proceed to lay before the Court of Directors the outline of the plan in which we are ourselves desirous to embark for founding, under the auspices of the Company, another settlement in New Zealand.

The new art of systematic colonization consists in defraying the expense of conveying the unemployed labour of the mother country to the unoccupied land of the Colonies, by means of the marketable value which the approach of an industrious population confers on the previously valueless wastes of a new country. The results of the experiments which have hitherto been made in the practice of this art are encouraging and instructive—encouraging, as affording a practical demonstration of the principle that the cost of emigration may be defrayed by means of the value it creates; instructive, as suggesting precautions for avoiding the causes of difficulty and retardation which have occurred in the earlier experimental settlements. Some allusion to these causes may be useful.

The provisions introduced into the Act of Parliament erecting South Australia into a British province, rendered the commission of practical errors unavoidable. The act prescribed the limits of the province before the character of the country included within those limits could be adequately known; it forced preliminary land-sales to absentee proprietors; and it precluded the Colonization Commissioners from commencing their operations by advancing the surveys, and by adopting precautions for the accommodation of the settlers on landing, and for placing them on their locations without delay and expense.

These impediments to early progress would be avoided under the arrangements now contemplated. It is proposed that the new settlement should be founded on some eligible site on the Eastern coast of the Middle Island of New Zealand. This part of the coast has been selected because it presents the very important advantage of having been already examined, and found to comprise an ample extent of fertile land, and to contain several safe and commodious harbours.

An advantageous site for the new settlement being in the first instance secured, we propose that the Company commence their operations by sending out a preliminary expedition, consisting of surveyors, civil engineers, mechanics, and a few agricultural labourers. On the arrival of the preliminary expedition at its destination, the surveyors should proceed to lay out the town, and the engineers to construct a landing-place, a wharf, and a road from the wharf to the centre of the town. At the same time, a portion of the mechanics should be engaged in erecting, in the immediate vicinity of the wharf, an extensive range of sheds for the reception of goods, and a spacious building, comprising a large dormitory, for the immediate accommodation of the first body of colonists on their landing. These objects being effected, a portion of the mechanics might perhaps be employed in erecting a church and a school-house. And while these several operations are in progress, the agricultural labourers should be employed in clearing and cropping an extensive suburban farm, which the Company might judiciously cause to be stocked with the best breeds of cattle and sheep from the Australian Colonies. After sufficient time has elapsed for the proximate completion of these important operations, or some of them, the first body of colonists, consisting of a due proportion of capitalists and labourers, should be despatched from this country.

Under these arrangements, the new settlement will present a field for the immediate commencement of productive industry. The impediments to early progress which occurred in the first experimental colonies will be removed; the labour and cost of landing and conveying the goods of the settlers will be abridged; the settlers on their arrival will not be exposed to hardship and privation; they will be placed at once upon their locations, and will be enabled to purchase at moderate prices the seed and stock previously provided by the Company. The capital which ought to be devoted to immediate cultivation will not be exported for the purchase of provisions. The settlement will be made from the first an appropriate residence for a civilised community.

MODE OF PROCEEDING.

I. It is proposed that the Company shall select 100,600 acres of land for the settlement.

II. Of the 100,600 acres thus selected, 600 acres may be divided into 1,600 town sections of a quarter of an acre each; 20,000 acres may be divided into 1,000 suburban sections of twenty acres each; and 80,000 acres into 1,000 rural sections of eighty acres each.

N.B. The area of the town is proposed to be reduced from 1,000 acres to 600, because in the first settlement the larger area has been found to occasion inconvenient expansion and distance. Of the 600 acres, 200 will be reserved for streets, roads, wharfs, squares, and public buildings and works. The remaining 400 acres will be divided into 1,600 sections, of a quarter of an acre each. A section of a quarter of an acre in a town of 600 acres may not be less valuable than a town section of one acre in a town of equal population extended over 1,000 acres. Suburban sections are suggested as affording the prospect of a rapid increase in value from proximity to the town.

III. The lands of the settlement may be distributed into 1,600 allotments; namely, into 1,000 allotments, consisting each of one town section, one suburban section, and one rural section; and into 600 allotments, consisting each of one town section.

IV. The Company should offer for sale in this country, at the price of 125*l*. each, the 1,000 allotments, consisting each of a town, a suburban, and a rural section.

V. In awarding the first-named 1,000 allotments to purchasers, the priority of choice should be determined by lot. The remaining 600 allotments, consisting each of one town section, should be offered for sale at the price of 25*l*. each. Provision should be made to enable purchasers to choose consecutive numbers, so as to hold two or more adjoining sections if they desire them.

VI. The sum of 140,000*l*., to be received by the Company for the 1,600 allotments offered for sale, may be appropriated as follows:—

First, The Company might retain, for defraying expenses not otherwise chargeable, for guarding against unforeseen difficulties, and for its commission upon the transaction .	£40,000
Secondly, The remaining 100,000*l*. should be primarily charged with the expenses of surveys and management; after defraying which, the residue to be thus applied, viz. One-half to emigration; one-half to public works, such as roads, wharfs, bridges, and buildings, for the reception of the first emigrants . . .	100,000
Total . . .	£140,000

By this arrangement, after setting aside an adequate sum for the Company's expenses and remuneration, the large fund of 100,000*l*. will be employed in defraying the expense of the surveys and management, in sending out labour to the colony, and in effecting those improvements by which labour is abridged. This arrangement will be found more beneficial to the capitalist who employs labour, than that of devoting a larger portion of the proceeds of the land-sales to emigration, as was done in the former settlements founded by the Company. The quantity of work performed by two labourers, in a settlement provided with wharfs, roads, and bridges, will be greater than that which could be performed by those labourers on a settlement not provided with these important facilities for rendering industry effective. Immediate labour, when not aided by the results of previous labour, can accomplish little: when the means of communication are imperfect, a great portion of the available labour of the community must be devoted, not to immediate production, but to overcoming the difficulty of transport. Estimated, not by the number of hands, but by the quantity of work, the actual supply of labour will be increased by diverting a portion of the proceeds of the land-sales from emigration to the execution of works by which labour is abridged.

On behalf of a body of persons who contemplate the formation, under the auspices of the Company and on the plan herein sketched out, of a settlement in New Zealand, to be situated on the Eastern coast of the Middle Island,

I have the honour to be, Gentlemen, your most obedient servant, (Signed) George Rennie, Junior.

REPLY OF THE NEW ZEALAND COMPANY.

New Zealand House, Broad Street Buildings,
12th August, 1842.

Sir,—I am instructed by the Court of Directors of the New Zealand Company to acknowledge the receipt of your letter dated the 28th ult., on behalf of a body of persons contemplating emigration to New Zealand, in which you suggest the formation by the Company, on the plan pointed out in your letter, of a new settlement to be planted on some eligible site on the Eastern coast of the Middle Island. The Court has given this proposal its serious consideration, and I am now directed to communicate to you its views on the subject.

The Directors of the New Zealand Company feel it incumbent upon them at all times to do the utmost in their power to further the views of persons desirous of emigrating, and to prove to them that the Company is ever ready to perform its function as a national instrument of colonization. The Directors deem this duty to be the more imperative upon them in times like the present, when general distress pervades this country, for which extensive colonization appears to offer the best, if not the only prospect of substantial relief. I have therefore to inform you, that the Court is willing to entertain generally the proposal of a new settlement on the Eastern coast of the Middle Island of New Zealand, *provided that her Majesty's Government will consent thereto upon such* *terms as shall afford the Company a reasonable remuneration for the responsibility and risk of the undertaking,* and provided no insuperable difficulties shall be found to arise out of circumstances now unforeseen. With respect to the plan which you have submitted, the Court sees no objection to its outline; but desires to be understood as reserving its final judgment as to the details until the enterprise shall be somewhat more matured.*

The intention of the Company to establish at proper opportunities a succession of distinct settlements upon the coasts of New Zealand has been for some time before the public, and the motives of that intention will be sufficiently understood by reference to the Directors' Third Report. It is only requisite, therefore, to add, that you are at liberty to make generally known the readiness of the Company in the present instance to entertain the principle of your proposal: and when you shall have obtained an assurance of the approbation of Her Majesty's Government, the Directors will be prepared to enter into further communications with you, and with the parties whom you represent, in order that your wishes may be carried into practical operation.

I have the honour to be, Sir, your most obedient servant,

(Signed) JOHN WARD, Secretary.

George Rennie, jun., Esq., 1, Chesham-pl., Belgrave-sq.

SPORTING.

DONCASTER RACES.—Many of our sporting readers will recollect that the Doncaster races of last year were remarkable not less for the indifferent character of the sport than for the energetic measures resorted to for the purpose of restoring them to something like their original excellence. Several meetings and conferences were held with this view, and their results appeared to justify the inference, that in the adoption of a new and more vigorous system, the municipal authorities and their patrons had taken the only effective means of obtaining their object. The corporation, as we stated at the time, consented to resign the entire control of the races to a committee of noblemen and gentlemen belonging to the Doncaster Club, and to place at their disposal the sum of 1,000*l*. to be applied towards the promotion of sport. The committee turned this power to excellent account. The Great Yorkshire Handicap, and the Five Hundred Sovereigns Stakes, were its immediate fruits; and they were followed by some judicious alterations in the conditions of the Cup for the present year, and the St. Leger for 1843. Under these favourable auspices, the races commenced on

MONDAY, with *The Champagne Stakes of 50 sovs. each*, h. ft., for 2-yrs. olds; Red-house in. (34 subs.)—Won by Mr. Blakelock's A British Yeoman, by Liverpool (Templeman); beating Lord Maidstone's The Caster, by Emilius; Lord Westminster's Maria Day, by Physician; Lord Sligo's Winter, by Wedge; and Mr. Ramsay's Lady Skipsey, by Inheritor. The race was never for a moment in doubt; A British Yeoman having made all the running, and won in a canter by a length. The second, third, and fourth were close together, and were several lengths before Lady Skipsey. The winner has been backed heavily for the Derby, at 33, 40, and 50 to 1.

The Great Yorkshire Handicap of 25 *sovs. each*, 15 *ft., and* 5 *ft. only if declared, with* 200 *added by the Corporation; the second to receive* 100 *sovs. out of the stakes, and the third to save his stake. The winner to pay* 20 *sovs.* St. Leger Course. 100 Subs., 59 of whom paid 5 sovs. each.—Won by Sir C. Monck's Brother to Garland (Ebdale); beating Hon. T. O. Powlett's Disclosure and Mr. Robertson's Little Wonder. The following also started, but were not placed: Mr. Johnstone's Charles XII., Mr. Vansittart's Galaor, Lord Palmerston's Ilione, Major Hay's Retriever, Mr. Collett's Tubalcain, Col. Cradock's Pagan, Mr. Bell's Thirsk, Mr. G. Clark's William le Gros, Mr. Peck's Paragon, Mr. Osbaldeston's The Devil among the Tailors, and Mr. Crawford's br. f. by Langar out of Mermaid. Retriever was restive at the post, and was with difficulty coaxed away with his companions: no sooner, however, was the start effected, and a better was never witnessed, than he rushed to the front, and made strong running, waited upon by Paragon, Pagan, and Ilione; Charles XII., Galaor, and Disclosure lying with the ruck, and Brother to Garland and William le Gros bringing up the rear. At the mile post Ilione took the lead from Retriever, and went a rattler to the Red House, where Thirsk took the command, followed by Pagan, Brother to Garland now being up with Disclosure, Galaor, Charles XII., and Little Wonder. Thirsk resigned his position at the road, fell astern, and the lead was taken by Brother to Garland, followed by Disclosure and Galaor; these three joining issue at the distance, made a pretty race to the corner of the Grand Stand enclosure. Galaor then dropped off, Disclosure was beaten before they cleared the rails, and the light-weight ran in a very easy winner by a length. Little Wonder came with a rush at the last, and saved his master's stake, Disclosure beating him a length for second; Galaor was a bad fourth, and Charles XII. fifth; the others were tailed off an immense distance. Value of the stakes, 1,320*l*.

Her Majesty's Plate of 100 Guineas. Four miles.—Won by Mr. Ramshay's Moss Trooper (Lye), beating Mr. Gascoigne's Jack Sheppard, Mr. Osbaldeston's Woldsman, and Lord G. Bentinck's Yorkshire Lass. Even on Jack Sheppard, who made the running for the first round; it was then taken up by Woldsman, who maintained it till near the distance, when Jack Sheppard resumed his lead, Moss Trooper taking the second place; half-way up the distance the latter went in front, and won in a canter by two lengths.

Four-years-old Produce Stakes of 100 sovs. each, h. ft. Two miles. Three subs.—Gen. Sharpe's Lara walked over.

TUESDAY.—*The Two-years-old Produce Stakes* of 100 sovs. each, h ft Red House in, 3 Subs.—Won by Mr. Clark's b f Amine by Bay Middleton. (Walked over.)

Sweepstakes of 100 sovs. each; for three-years old colts. Mile and a half. 3 Subs.—Won by Mr. Bowe's The Ladye of Silverkeld Well (Nat); beating Mr. Mostyn's b c by Bay Middleton, out of Her Highness. The Ladye made all the running, and won in a common canter by several lengths.

The Great St. Leger Stakes of 50 sovs. each, h. ft.; the second to receive 100*l*. out of the Stakes. St. Leger Course. 133 Subs.—Won by Lord Eglinton's Blue Bonnet, by Touchstone (Lye); beating Gen. Yate's Seahorse by Camel, Mr. Forth's Policy by Bustard, Colonel Anson's Attila by Colwick, Mr. Bell's Eboracum by S. Nicholas, Mr. Clark's Master Thomas by Tomboy, Mr. Combe's Rosalind by Touchstone, Mr. Ferguson's Fireaway by Frenzy, Mr. S. King's Cattonite by Muley Moloch, Mr. Kitching's Priscilla Tomboy by Tomboy, Mr. Meiklam's Aristotle by Physician, Mr. Owsley's Happy-go-Lucky by Young Emilius, Mr. Price's Marion by the Mole, Mr. Ramsay's Cabrera by Tomboy, Mr. Thompson's Pharmacopœia by Physician, Mr. Dixon's Ballinkeele by Birdcatcher, and Lord Miltown's Scalteen by Philip. Betting at starting—11 to 8 agst Attila, 7 to 1 agst Ballinkeele, 8 to 1 agst Blue Bonnet, 10 to 1 agst Cabrera, 12 to 1 agst Rosalind, 13 to 1 agst Eboracum, 14 to 1 agst Fireaway, 15 to 1 agst Policy, 20 to 1 agst Seahorse, 25 to 1 agst Scalteen, 25 to 1 agst Master Thomas, and 50 to 1 agst any other. About a quarter past three, fifteen out of the seventeen that started had taken their preliminary canters; and, some minutes after, the other two, Attila and Master Thomas, made their appearance in company, took a short gallop, and joined in the customary parade from the grand stand to the starting-post. After one slight failure, an effective start was accomplished, and the race commenced, Attila taking the lead at a strong pace, followed by Master Thomas and Eboracum, Marion, Priscilla Tomboy, Fireaway, Happy-go-Lucky, and several others treading upon their heels, with every other horse in the race closely laid up, except Ballinkeele, Seahorse, and Cattonite. Marion receded from the front rank in a few strides; and Priscilla Tomboy, finding the speed too much for her, was fain to keep company with Seahorse and Cattonite in the rear. In rising the hill, Scalteen was passed by Eboracum, who neared the favourite at the mile-post, and forced the running so effectually that at the Red House it was evident, even from the stand, that Attila was in difficulty. In making the bend this was placed beyond all doubt, and "The favourite 's beaten!" was heard from all parts of the course. Eboracum and Scalteen retired with him, and the running was taken up by Fireaway. Blue Bonnet, who had been in the ruck up to the Red House, showed in front immediately after with Priscilla Tomboy, and at the two-mile post they were close up with him, Blue Bonnet lying on his left close to the rails, and Priscilla Tomboy on his right; Cabrera was in their wake, and Seahorse, who had been most conspicuously in the rear to the turn, having passed the beaten horses rapidly, was lying in his track at the distance. About two hundred yards from home, Blue Bonnet wrested the lead from Fireaway, was never after caught, and won very easily by a length. Priscilla Tomboy went past Fireaway at the stand, but was herself challenged by Seahorse a few strides from the chair, and beaten by half a length. Fireaway turned jady before he reached home, began kicking, and was a bad fourth. Ballinkeele made a waiting race of it, and, by an effort at the last, ran his compatriot Fireaway to a length. Cabrera was some lengths behind, and was followed in by a crowd of horses, at the head of which, it is understood, were Attila, Pharmacopœia, Policy, &c. Cattonite looked in bad condition, and ran as bad as he looked—he was beaten off in the first fifty yards. The race was run in three minutes eighteen seconds. Value of the stakes, 3,600*l*. That Attila was a different animal to the Attila that won the Derby, cannot be doubted—he was very nervous at the post, and betrayed other unequivocal symptoms of not being in his proper racing form; had he shown ten minutes sooner, he must have gone back in the betting. Seahorse's friends were very much annoyed at the position he occupied from the starting post to the Red House—they insist that Chapple lay out of his ground, and that his chance was greatly prejudiced by having so much leeway to make up; the fact is believed to be that he lost a little ground at starting, but that, like Priscilla Tomboy, he could not go the pace. The settling seems likely to be easy; Lord Eglinton wins about 5,000*l*., and his trainer, Dawson, (the owner of Nell, the winner of the Oaks, and friends), a much larger sum.

The Cleveland Handicap of 20 sovs. each, 10 ft., and 5 only if declared, with 60 sovs. added; the second receives 30*l*. One mile. 25 subs., 13 of whom declared.—Won by Mr. Walker's Billingham Lass (Bumby); beating Lord Chesterfield's Knight of the Whistle, Lord Kelburne's c. by Retainer, d. by St. Patrick, Mr. Brooks's Idolatry, Mr. Denham's Compensation, Mr. Bell's Frea. Billingham Lass made all the running to the distance, and after a slashing race home with the Knight of the Whistle, won by a head.

The Chesterfield Stakes of 20 sovs. each, with 5 added. One mile and a half. 3 subs.—Won by Col. Cradock's Pagan (Templeman); beating Mr. Gascoigne's Jack Sheppard. Pagan ran a waiting race, and won cleverly by half a length.

WEDNESDAY.—*The Doncaster Stakes* of 10 sovs. each, with 50 added by the Corporation. Two miles. (3 subs.)—Mr. Clarke's Master Thomas. Walked over.

The Foal Stakes of 100 sovs. each, h. ft. Mile and half. (9 subs.)—Won by Mr. Ramsay's Cabrera, by Tomboy (Noble); beating Lord Westminster's Auckland and Mr. Goodman's Rover. Rover made good running to the Red House, where he broke down; Cabrera took his place, kept it to the end, and won easy by two lengths.

The Selling Stakes of 10 sovs. each, with 30 added. St. Leger Course. The winner to be sold for 200*l*., &c. (6 subs.)—Won by Gen. Sharpe's Lara, by Langer (Templeman); beating Mr. Jones's Tubalcain, by Cain; Mr. Dawson's The Biddy, by Bran; and Mr. Addison's Slipshod, by Augustus. Lara made nearly all the running, and won easy by a length: the third and fourth were beaten off.

The Municipal Stakes of 500 sovs. each, 200 ft. Red House in. (6 subs.)—Won by Col. Anson's Napier, by Gladiator (Nat); beating Lord Eglinton's Aristides and Mr. Wreford's c. by Camel. Napier made all the running, and won in a canter by two lengths. The Monimia colt was beaten off.

The Corporation Plate of 60*l*.; the second to receive 27 guineas. Heats two miles.—Won by Mr. Goodman's The Shadow (S. Rogers); beating Mr. Orde's Beeswax, Mr. Greville's Welfare, and Mr. G. Clark's Baronet. The Shadow was the favourite, and won both heats in a canter.

THURSDAY.—*The Gascoigne Stakes.*—Won by Attila, walked over.

Three-year old Stakes of 200 sovs. each.—Won by the Artful Dodger, walked over.

The Two-year-old Stakes.—Won by Mr. Blakelock's A British Yeoman; beating Lord Westminster's Maria Day and Mr. G. Clarke's The Era. The following also ran:—Pharaoh, Trueboy, the Ganymede c., Lady Skipsey, The Caster, Mr. Mostyn's c. by Velocipede, Merry Andrew, and c. by Bay Middleton, out of Mermaid. Won by a head.

The Gold Cup.—Won by Mr. Orde's Beeswing; beating Mr. Johnstone's Charles XII, Mr. Goodman's The Shadow and Col. Anson's Attila.—Won in a canter.

MARK LANE, FRIDAY, SEPT. 16.—The arrivals of every description of Grain since Monday are small, and the Trade both on Wednesday and this morning was confined to needy retail buyers; the little English Wheat fresh up could not be disposed of at late prices; but there is no inclination on the part of holders of Foreign to submit to lower rates. Barley, Beans, and Peas, are unaltered in value, and the sale of Oats is confined to small purchases at Monday's prices.

GAZETTE OF THE WEEK.

INSOLVENTS.—H. Payn, Liverpool, master mariner—J. Reid, St Alban's, chemist.

BANKRUPTS.—J. Simmons, Princes Risborough, Buckinghamshire, corn dealer—T. Hutchinson, Old Gravel-lane, Wapping, sugar refiner—T. Gooch, Dalston-terrace, West, and Whitechapel-road, timber merchant—W. Huskisson, Birmingham, linen draper—M. Duncan, Newport, Monmouthshire, linen draper—J. Brooks, Liverpool, hotel keeper—G. Jellicoe, Bilston, Staffordshire, ironmaster—D. Holt, Manchester, broker—R. Bull, Birmingham, common brewer—G. Cole, Toy Hotel, Hampton, innkeeper—J. Vardy, Wolverhampton, brass founder—G. Heathcote and W. Levesley, Sheffield, spring-knife manufacturers—S. Thomas, Heworth, York, victualler—R. Craig, Manchester, innkeeper—R. Womersley, Stoney Stratford, Buckinghamshire, hat manufacturer—G. Oldham, Manchester, wine and spirit merchant—J. B. Boucher, Birmingham, shawl dealer—W. Mearns, Liverpool, shawl dealer.

SCOTCH SEQUESTRATIONS.—A. Munro, Inverness, shipwright—G. Scott, Glasgow, cabinet maker—A. Shortrede, Edinburgh, printer.

BIRTHS.—On the 7th inst., at Pantyderi, in Pembrokeshire, the lady of Colonel Colby, of the Royal Engineers, of a daughter—On the 12th inst., at Plasgwyn, county Anglesey, Lady Vivian, of a daughter—On the 14th inst., at Westoner, Isle of Wight, the lady of the Hon. W. A'Court Holmes, M.P., of a daughter—On the 10th inst., at Warwick Villas, Harrow road, the lady of Captain Edward Foord, H.C.S., of a daughter—On the 13th inst., in Albany-street, Regent's Park, the wife of R. D. King, Esq., her Majesty's Vice-Consul in Hayti, of a son—On the 13th inst., at Cheltenham, the lady of R. Hart, Esq., of Drips-hill House, in the county of Worcester, barrister-at-law, of a son—On the 3rd ult., at Oporto, the lady of L. W. Tinelli, Esq., the American consul, of a daughter—On the 11th inst., at 20, Soho-square, Mrs. Mackinlay, of a daughter.

MARRIED.—On the 13th inst., the Hon. and Rev. C. G. Perceval, to Frances Agnes, second daughter of the late Rev. G. Trevelyan, archdeacon of Taunton—On the 6th inst., at Maryfield's, Edinburgh, R. H. Evans, Esq., of London, to Jessie, eldest daughter of the late A. Burns, Esq., of the Hermitage, Leith—On the 14th inst., at St. George's, Hanover-square, P. Cunningham, Esq., third son of Allan Cunningham, Esq., to Zenobia, second daughter of J. Martin, Esq., K.L.—On the 14th inst., at Worting, Hants, W. L. Smart, Esq., of Trewitt-house, Northumberland, to Charlotte Catherine, second daughter of the late W. H. Gordon, Esq., of the Civil Service, Madras—On the 29th of June, at Delhi, Captain Marshall, 73rd Bengal N.I., to Elizabeth, third daughter of the late W. Butt, Esq., of Corneybury, Herts—On the 13th inst., at St. George's, Hanover-square, H. G. Astell, Esq., of the Bengal Civil Service, third son of W. Astell, Esq., M.P. for Bedfordshire, to Louisa Maria, eldest daughter of Major-General Wynyard, C.B.

DIED.—On the 13th inst., at Kilburn Priory, aged 56, Frances, relict of W. Parkes, Esq—At Sheffield, the Rev. J. W. Niblock, D.D., Head Master of the London High School, and Evening Lecturer of St. Mary Somerset, Thames-street—On the 12th inst., aged 68, Mr. Joseph Langdon, late clerk of St. Mary's, Bryanston square—On the 9th inst., at Sharfield Villa, Essex, Harriett Maria, relict of the late J. Manby, Esq. of Downsells—On the 10th inst. at Greenwich, aged 80, Mr. John Calton, late of the Old Cheshire Cheese, Wine-office-court, Fleet-street—On the 13th inst., at Watford, Herts, S. Salter, Esq., aged 70.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates.
Price 2*s*. 6*d*.

PAXTON'S MAGAZINE OF BOTANY.

The Number for September, 1842, contains highly-finished drawings of *Combretum grandiflorum*, *Làlage Horeæfòlia*, *Malva campanulata*, and *Péntstemon gentianoides*, var. *splendens*; likewise Papers on Gardening as a science; on Grouping Ornamental Plants; and Suggestions for Training Cacti. Floricultural Notices of new and beautiful Plants figured in the leading Botanical Periodicals for August; together with a complete Calendar of Monthly Operations for the Garden.

This work comprises, monthly, four admirably-coloured plates, and twenty four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.
2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.
3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.
4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

Ready for the Press, and shortly will be Published,

A COMPREHENSIVE PRACTICAL TREATISE, or a New Era in the CULTURE OF THE VINE UNDER GLASS, as to its earlier Precocity, &c. &c. BRIGHTON FLORAL AND HORTICULTURAL SOCIETY.—At its Third Annual Exhibition of Flowers, &c., the above Society will offer a Sweepstakes for Dahlias, open to the public, in three Prizes, viz., 1*l.* 10*s.*, 1*l.*, and 10*s.* Each pan to contain 12 dissimilar flowers, Seedlings excepted. Entrance, 5*s.* The Show will take place at the Town-Hall, on the 28th inst.

R. COLBING, Secretary.

GENUINE DUTCH AND CAPE BULBS.

J. CARTER, Seedsman and Florist, 238, High Holborn, London, begs to inform his customers, that his annual supply of DUTCH AND OTHER FLOWER BULBS is now arrived. On account of the very favourable season the quality is much finer than usual.

GUERNSEY AND BELLADONNA LILIES, 8*s.* per dozen, box included. These ought to be planted as soon as possible.

S. GIRLING begs to inform the Public that he will have strong and well-rooted Plants of the following ready for delivery on and after the 1st of October:

PANSIES.

DESIDERATA.—For colour and description of this beautiful Pansy, see *Gardeners' Chronicle* for May 28th of the present year. F. Barnes's, No. 5. Price per plant, 7*s.* 6*d*.

CLARA.—Upper petals, bright puce; lower petals, pure white, with a splendid eye; quite round, flat, and superb show flower. Price 5*s.*

PHLOX OMNIFLORA MAGNA.

This splendid Phlox is of a pure white, very large, round, and of excellent habits; very superior to any Phlox in cultivation. Price 5*s.*

VERBENAS.

IGNESCENS.—A bright fiery scarlet, producing large corymbs of fragrant flowers, equal in size to V. delicata. Price 3*s.* 6*d*.

EXIMIA.—A bright rosy pink, close and compact growing, large, and very fragrant, and quite distinct from any out. Price 3*s.* 6*d*.

N.B.—No allowance to the trade unless three or more of either variety are taken.

S. G. likewise begs to state he has strong plants of his much-admired Seedling Verbenas of last and the preceding year's growth, viz., Teucrioides carnea, T. rosea, Barnesii, violacea, delicata, punicea, &c., &c., at moderate prices.

Remittance or reference from unknown correspondents is respectfully solicited, and early orders are particularly recommended, as the stock of some is limited.

P.S.—Orders taken by Warner and Warner, Cornhill.

Danecroft Nursery, Sept. 8, 1842.

UNION ROAD NURSERIES, PLYMOUTH.

WILLIAM E. RENDLE, NURSERYMAN, SEEDSMAN and FLORIST, has the pleasure of offering to the Nobility, Amateurs, and the Trade, the following new varieties of

PELARGONIUMS,

raised by P. E. Lyne, Esq., of Lipson, the entire stock of which he has succeeded in obtaining:—

Lyne's Sunrise	£3	3	0	each
„ Duke of Cornwall	3	3	0	„
„ Lord Ebrington	2	2	0	„
„ Princess Royal	2	2	0	„
„ Cynthia	1	10	0	„
„ Modesty	1	10	0	„
„ Hamlet	1	10	0	„
Bassett's Glory of the West	2	2	0	„

The usual Discount to the Trade.

Strong Plants of Princess Royal and Glory of the West are now ready for delivery. The other sorts will be sent out in October.

Agents in London—Messrs. Warner, Seedsmen, Cornhill, and Mr. Wm. Bristow, Seedsman, Knightsbridge; from whom Plants and descriptions can be procured, and where drawings of some of the sorts may be seen. Descriptions of the Seedling can also be had on application at the Union Road Nursery, Plymouth.

Union Road Nursery, Plymouth, August 3, 1842.

THE SUBSCRIBER now offers to the Trade a large quantity of BUCK'S TRUE INTERMEDIATE STOCK SEED, all of his own saving, at moderate Terms. Packets for Amateurs from 1*s.* to 2*s.* 6*d*. each. Has a fine Collection of DUTCH ROOTS, Catalogues of which can be had on application. —JAMES BLACK, Seedsman, Bayswater.

SUPERB SEEDLING DAHLIAS OF 1841.

F. AND A. SMITH and Co. beg to invite Amateurs and the Trade generally to inspect their SEEDLING DAHLIAS, Bianca, Sir R. Sale, Rainbow, Duke of Wellington, &c., whilst in growth; and they flatter themselves that they will (from their novelty and superior form) well repay the trouble of a visit, and prevent disappointment. Blooms may also be seen at most of the Seed-shops in London.

The Nursery is situated on the High Road. Omnibuses from the Royal Exchange, and Flower-pot, Bishopsgate-street, pass every quarter-of-an-hour—Fare 6*d*.

Hackney, London.

FULLER'S SPLENDID PELARGONIUM, MADEMOISELLE RACHEL, is now ready for Delivery at Five Guineas each. For particulars, see Advertisement in the *Gardeners' Chronicle*, Sept. 3d.

Orders received in London by Marnock and Manley, Hackney; Henderson, Pine Apple Place; and Harrison, Downham Market, Norfolk.—Floricultural Grounds, Park Crescent, Worthing, Sussex.

SUPERB SEEDLING PANSIES.

J. AND T. GOODE beg to announce they have now ready for delivery strong healthy plants of 12 Seedlings, which are considered first-rate flowers by all who have seen them, at 42*s.* the Collection, Package included. J. and T. G. can also supply the choicest of last year's Varieties, by all Growers, 21*s.* per dozen; Older Show Varieties, by name, from 9*s.* to 12*s.* per dozen; Fine Border Varieties, 3*s.* per dozen; a few Packets of fine selected Seed, at 2*s.* 6*d*., 5*s.*, and 10*s.* per Packet. Descriptive Catalogues may be had on prepaid application at the following places:—Messrs. Cormack and Co.'s, Bedford Conservatories, Covent Garden, and New Cross Nurseries; Mr. H. D. Cormack's, 106, Deansgate, Manchester; and of the Advertisers, Ponder's End, Middlesex. A remittance respectfully requested from unknown correspondents.

J. T. WILLMER, FLORIST TO THE QUEEN, begs most respectfully to inform his Friends and the Public that he has commenced sending out plants of Picotees and Carnations, which are fine and healthy, well rooted, and from his immense stock of upwards of 20,000 Layers, J. T. W. now offers to execute any order he may be favoured with at the following prices:—

50 pairs of fine selected sorts of Carnations or Picotees, or in part of each, for	£3	0	0
25 ditto ditto	1	10	0
12 ditto ditto	0	15	0
Fine strong Auriculas, healthy and well established in Pots, 12 fine selected kinds, including basket, &c.	1	10	0
N. B.—A few pans of his superb new Pinks (Prince of Wales)	0	7	6
Willmer's Miss Jane	0	5	0
Ditto Attila	0	5	0
Cooper's Prince Albert, large and fine	5	0	0
Cooper's Princess Royal	0	5	0

For ready money only. A General List may be had by post, on application, enclosing twopenny stamps.—Sunbury, Middlesex.

This advertisement will not be repeated.

WILLIAM IVERY, Rye-lane, Peckham, begs to inform his Friends and the Public that he can again supply strong plants of the following Cinerarias: Royal Blue, Rival Ring, Imperial Blue, Grandissima, Queen Victoria, Corminius, Splendida, and Greenii, at 2*s.* 6*d*. each. Also strong Bulbs of Tropæolum Jarratti, 30*s.* per doz., or 3*s.* 6*d*. each; tricolorum, 20*s.* per doz., or 2*s.* 6*d*. each; Achimenes longiflora and rosea, 2*s.* 6*d*. each.

ROSES.

T. RIVERS, Jun., begs to announce to his Friends and the Public, that his New Descriptive CATALOGUE OF ROSES will be ready for delivery by the end of the month. This will be sent, as usual, Post paid, to all those who have ever honoured him with their commands. Applications also, enclosing a twopenny stamp, will be promptly attended to.

Sawbridgeworth, Herts, Sept. 21, 1842.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WILLIAM WOOD & SON beg leave to inform their numerous Patrons, and Rose Amateurs in general, that their NEW CATALOGUE OF ROSES, for the present season, is now ready for distribution, and will be sent, GRATIS, on application.

The immense Stock of Roses at Maresfield are this season finer and more luxuriant than ever; no pains or expense have been spared to render the collection as rich and unique as possible.

The General Catalogue of Nursery Stock and Trade List of Roses, &c., are also ready for distribution.—Sept. 21st.

TWO SPLENDID NEW PURPLE PICOTEES.

WOOD'S LORD HINCHINBROOK, a superb Flower of large size, marking perfect, ground colour of the most snowy whiteness, petals large, and of a beautiful shape, forming a most excellent show flower.

WOOD'S LADY ST. JOHN, a beautiful light-edged Flower, of most superb form and petal, possessing, in short, all the requisites of a first-rate show flower.

J. WOOD, Florist, &c., Huntingdon, begs to announce that the above Picotees, which elicited the admiration of numbers of Florists who saw them in bloom, are now ready for sending out, and can be forwarded by post to any part of the United Kingdom. Price 15*s.* per pair, postage and package included. J. W.'s Catalogue of Carnations, Picotees, &c., for the present season, may be had on application, by inclosing a postage stamp.

N.B.—A remittance or reference expected from unknown correspondents.

CARNATIONS, PICOTEES, AND PINKS.—NATHANIEL NORMAN, Florist, begs to call the attention of the Nobility, Gentry, Amateurs, and his friends generally, to his select Collection, comprising the finest show varieties, with which he has gained twenty prizes this season at the following Societies: London Horticultural, Royal South London, South Essex, and Floricultural Society of London. Has 10,000 Plants now ready, in fine healthy condition.

Catalogues may be had on prepaid application.—Bull Fields, Woolwich.

HYACINTHS, TULIPS, &c.—H. GROOM, Clapham Rise, near London (removed from Walworth), by appointment Florist to her Majesty, respectfully informs the Nobility and Gentry that he has received his Collection of Dutch Roots in excellent condition, and that his Catalogue of Bulbs is ready, and may be had on application.

MYATT'S BRITISH QUEEN STRAWBERRY, after two years' competition, still maintains its pre-eminence; and, in returning thanks to their numerous patrons and friends, J. and W. Myatt beg to say they can with confidence recommend it as the most superb fruit yet known.

Also their new Seedling Strawberry Prince Albert, which for productiveness and size cannot be equalled. Price per 100, each, 50*s.*; and their Eliza, 20*s.* Runners are now ready, and may be had on application to them at Manor Farm, Deptford.

Myatt's famed Victoria Rhubarb, 50*s.* per 100 sets, or 1*s.* 6*d*. per root, will be ready in October.

FERNS.

WM. PAMPLIN, NURSERYMAN, LAVENDER HILL, WANDSWORTH, begs to invite attention to his Collections of that beautiful tribe of Plants—the Ferns. W. P. offers strong healthy Plants in pots at prices varying from 9*d*. and 1*s.*, to 10*s.* each, according to rarity of species, &c.

W. P. will also supply ASSORTED COLLECTIONS as follows:

A Collection of Forty species for	£2	2	0
„ of Twenty „	1	5	0
„ of Twelve „	0	15	0
„ of Six „	0	7	6
A Collection of Thirty Species, all sub-hardy and hardy Exotic	3	15	0
„ of Twenty-five „	3	3	0
„ of Twenty „	2	10	0
„ of Twelve „	1	10	0
„ of Six „	0	12	0

Wardian Cases of Ferns, or Ward's portable Greenhouses, of various sizes and prices, with the Plants, from Seven Shillings and Sixpence to Two and Five Guineas.

⁂ Wardian Cases fitted up and furnished with Plants at very moderate prices.—Lavender Hill Nursery, Sept. 10, 1842.

TO GROWERS OF HYACINTHS, AND OTHER DUTCH BULBS.

MESSRS. YOUELL have much pleasure in announcing that they have just received their importation of the above direct from Haarlem, the Bulbs being remarkably large and sound. For particulars see their advertisement in the *Gardeners' Chronicle* of 27th August.

Catalogues may be had on application.

Great Yarmouth Nursery, Sept. 1st, 1842.

CARNATIONS AND PICOTEES.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

YOUELL & CO.'s Superb Collection of the above will be found to contain every attainable variety worthy of cultivation; and having spared no expense in rendering their Collection the most extensive and select in the kingdom, they beg to announce that they purpose commencing to execute orders the first week in October, upon the following terms:—

25 pairs	of extra fine first-rate Show flowers,	£5	0	0
12 „	do. do. do.	2	10	0
25 „	of fine Show flowers,	3	0	0
12 „	do. do.	1	10	0
25 „	of extra fine Show Pinks,	1	4	0
12 „	do. do.	0	12	0

The selection being left to Y. & Co.

They beg further to state that, having a peculiar mode of packing the above plants, so as to insure their safe delivery in any part of the United Kingdom per Post, for the information of parties at a distance, wishing to avoid the expense of Carriage, Package, &c., they will send them free of postage, at the extra charge of 2*s.* per doz. pair.

A Post-office order, or reference, is respectfully requested from unknown correspondents.

Catalogues may be had on application, by enclosing two postage stamps.

NEW SUPERB FUCHSIAS.

Youell & Co. beg respectfully to state, that they continue sending out, per Post (free), their Superb Collection of Fuchsias, at the rate of 21*s.* per doz.

Great Yarmouth Nursery, Sept. 8, 1842.

MICHAEL BREWER, Nursery, London Road, Cambridge, begs respectfully to call the attention of the Nobility, Gentry, and the Public to that invaluable new Strawberry, the EMPEROR. It is a strong grower, a great bearer, and has a fine flavour, with large scarlet fruit superior to Keen's Seedling, with the great advantage of being ripe a fortnight earlier.

Fine strong plants are now ready at 30*s.* per 100.

FUCHSIA ST. CLARE.

THE above magnificent FUCHSIA was raised by Mr. Meehan, Gardener to Col. Harcourt, at St. Clare, Isle of Wight, from whom Messrs. YOUELL obtained the entire stock. In May last it was submitted to Dr. Lindley for his opinion, which will be found in the *Gardeners' Chronicle* of the 14th of that month as follows:—

"Your Seedling Fuchsia is by far the finest hybrid we have seen; the flower being three inches in length, with the tube and sepals of a bright carmine colour, and the petals of a rosy purple. If, as you say, it is a strong grower and a free bloomer, it will prove a valuable addition to this beautiful genus."

Messrs. Youell, in bringing this beautiful production into public notice, do so without the slightest diffidence, being fully assured of its giving the most entire satisfaction. It is of vigorous habit, fine foliage, and, as a proof of its being a most profuse bloomer, they have a plant in flower at the present time on one branch of which there are upwards of 200 blooms, forming a splendid object for the Greenhouse, Conservatory, or Flower-garden.

Youell & Co. purpose sending it out in the second week of April next, at 10*s.* 6*d*. per plant, free of postage, to any part of the United Kingdom; and all orders they may be favoured with will be executed in rotation.

Orders from the Continent will receive every care in packing, so as to ensure their safety.

The usual discount to the Trade, where not less than 6 plants are ordered.—Great Yarmouth Nursery, Sept. 15, 1842.

CARNATIONS, PICOTEES, AND PINKS.

J. T. WILLMER and SON, King's Road, Chelsea, by appointment Florists to her Majesty, beg to inform the admirers of the above-named Flowers, that their Plants are now ready for delivery at the under-mentioned prices, the selection being left to W. and S.:—

25 pairs superior Show Carnations or Picotees		£4	0	0
12 do.	do.	do.	2	0	0
25 do.	do.	Pinks	1	1	0
12 do.	do.	do.	0	10	6

W. and S. beg to state that for health and strength their Plants stand unrivalled.

N.B.—A reference in London, or payment in advance, is respectfully requested from unknown correspondents.

King's Road, Chelsea, Sept. 14, 1842.

SPLENDID ERICAS (HEATHS), EPACRIS, BORONIAS, &c., &c.—J. and J. FAIRBAIRN, in gratefully acknowledging the kind and very liberal patronage they have been favoured with, beg leave most respectfully to solicit the attention and inspection of their friends and the public to their very large and exceedingly healthy Stock of the above highly beautiful tribe of PLANTS, which they flatter themselves are not to be surpassed in the kingdom; and which, from the extent of their stock, they are enabled to offer upon the following very advantageous terms:—

100 fine flowering plants, including 75 Ericas, 20 Epacris, and 5 Boronias. The baskets and packages of the Ericas will consist of the most popular and esteemed kinds—Ampullacea, Ampullacea rubra and elegans, Tricolor, Tricolor superba and elegans, Eximia, Hartnelli, Ventricosa, Ventricosa superba, Globosa, Stricta, and Purpurea, Depressa, Vernix ovata, Westcottia, Willmoreana, Vestita, Hyemalis, Formosa, Mirabilis, Pattersoniana, Picta, Sulphurea, Viridiflora, Intermedia, Mammosa, Linnæana superba, Linnæana curvæflora, Humeana, Banksiana, Sanguinea, Daphnoides, Blanda, Jasminiflora alba. Donnei, Cliffordiana, Rubra, Cerinthoides, Cerinthoides magna, Grandinosa, Verticillata nova, Persoluta rubra, Boweana, Exsurgens coccinea, Echiiflora, Cruenta, Sulphurea, Blandfordia, Trossula, &c., &c., &c. The Epacris will contain Impressa, Impressa pallida, Campanulata alba and rubra, Variabilis, Nivalis, Onosmæflora major, Pulchella, Grandiflora, Pungens, and Purpurascens, &c. &c. for £7 10

75 Fine Flowering Plants from the same Choice Selection,			6	10
50 do.	do.	do.	5	0
25 do.	do.	do.	3	0

For the convenience of those Cultivators who are only desirous to add a few gems to their collection, J. and J. F. beg to offer the following very choice and rare Ericas, 12 plants, package included, for 3*l.*: Aristata, Massoni, Gemmifera, Macknabbiana, Inflata, Shannoniana, Tricolor, two beautiful new Varieties, Elegans, Cavendishii, Ampullacea vittata, and Ampullacea. No. 1, a beautiful new Hybrid variety.

J. and J. F. beg to acquaint their Friends and the Public, that their collections of Fuchsias and Verbenas contain all the best varieties in cultivation, and that, having large stocks, they are enabled to offer them at very moderate prices.

J. and J. F. beg leave also to inform their Friends and the Public, that their stock of Fruit-trees, Standard and Dwarf, Trained and Untrained (of the most genuine kinds), Evergreen and Flowering Shrubs, American Plants, Standard and Dwarf Roses, are particularly fine this season, and very extensive. Early commands will receive their prompt and most careful attention, and be much esteemed.

All Orders they may be favoured with packed upon the most approved principles, and delivered free of charge in London.

N.B.—A remittance or reference required from unknown correspondents.—Nurseries, Clapham, near London, Sept. 15, 1842.

ECONOMIC LIFE ASSURANCE SOCIETY, No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON. Established 1823. Empowered by Act of Parliament, 3 William IV.

LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured *to participate in the profits*, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The BONUS declared in 1834 amounted upon an average to 16*l.* per cent. on the premiums then paid; and in 1839 a second BONUS was awarded, amounting on the average to 31*l.* per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam vessel) from any one Port thereof to another during peace, to Assurers, not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice, are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

WESTBURTON, between ARUNDEL and PETWORTH, SUSSEX. PINE PLANTS, Live and Dead Farming Stock, and a Life Interest in 803*l.* 5*s.* 6*d.* Consols.—To be Sold by Auction, by MR. H. SALTER (on the premises), by order of the Assignees of JAMES BISSHOPP, a Bankrupt, on Tuesday, the 18th of October, 1842, at Eleven o'Clock. The PINES consist of about 4,000 Fruiting and Succession Plants of the very best quality. The PINES produced from this Pinery have always been celebrated for their Growth and Quality, and have obtained the highest prices in the London Markets; and as a further proof of their excellency, they have constantly carried the first Prize at the Shows in London, where they have been brought into Competition with all England. Together with about Three Thousand Flower and Pine Pots.—The FARMING STOCK consists of 5 capital Cart-Horses, a grey Pony, 43 two-tooth Wether Sheep, 8 fat Pigs, and a quantity of excellent Poultry. A four-horse power portable Thrashing Machine, 2 narrow-wheeled Waggons, Dung-Carts, Corn-Cracker, Chaff-Cutter, 2 Ploughs, Drag-Rakes, Cyder-Press, Cloths, and other Effects. THE LIFE INTEREST, of James Bisshopp, aged about 53 years, in the sum of 803*l.* 5*s.* 6*d.* 3 per Cent. Consols, standing in the names of Trustees, and producing an Annual Income of 24*l.* 1*s.* 10*d.*, will be offered precisely at Three o'Clock.

Catalogues will be ready 14 days previous to the Sale, and may be obtained on the Premises; at Mason's Printing Office, High-street, Steyning; and at the Office of the Auctioneer, Arundel. The PINE PLANTS and FARMING STOCK may be viewed the day previous to the Sale, and Particulars of the Life Interest may be obtained on application to Messrs. Ellis and Upton, Solicitors, Petworth.

TO MARKET-GARDENERS, NURSERYMEN, AND OTHERS.

PROTHEROE and MORRIS are instructed by the Trustees of Messrs. ADAMSON and SON, of Stoke Newington, to submit to public competition, on the premises, Wells-street, Hackney, on Monday, Oct. 3. 1842, at 11 o'clock precisely, the whole of the VALUABLE STOCK, consisting of about 800 Hand-glasses, 70 Three-light Boxes and Lights, the whole of which are in excellent condition, Horses and Cart, a quantity of fine Rhubarb for forcing, and sundry Utensils. May be viewed two days prior to Sale. Catalogues may be had on the premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

BELGRAVE NURSERY.

MESSRS. PROTHEROE & MORRIS are instructed by Mr. J. ROGERS, to offer to Public Auction, on MONDAY the 26th Sept. 1842, and following days, on the Premises, Eaton-square, Pimlico, in consequence of the lease having expired—The Glass and Erections of several Greenhouses and Pits, Brickwork, about 300 feet of 6-inch Waterpipe, a quantity of Flints suitable for Rockwork, and a large quantity of York Paving; also the whole of the Nursery Stock, consisting of fine large bearing Standard Mulberries, Almonds, Acacias, Limes, Poplars, Bignonias, Catalpa, Lilac, Cytisus, Laburnum, fine Hollies, Laurels, Privets, Box, Roses, Laurustinus, Aucubas, Bays, Scarlet and White Rhododendrons, Cedars of Lebanon, Evergreen Oaks, Arbor-vitæ, Cypress, Daphnes, Jasmines, a large quantity of Ivy in pots from 3 to 8 feet, Large Privet Hedges, Box Edging, Thrift, &c.; Pinks, Carnations, Herbaceous Plants, &c. &c.

May be viewed a week prior to the Sale.—Catalogues to be had on the premises, of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone.

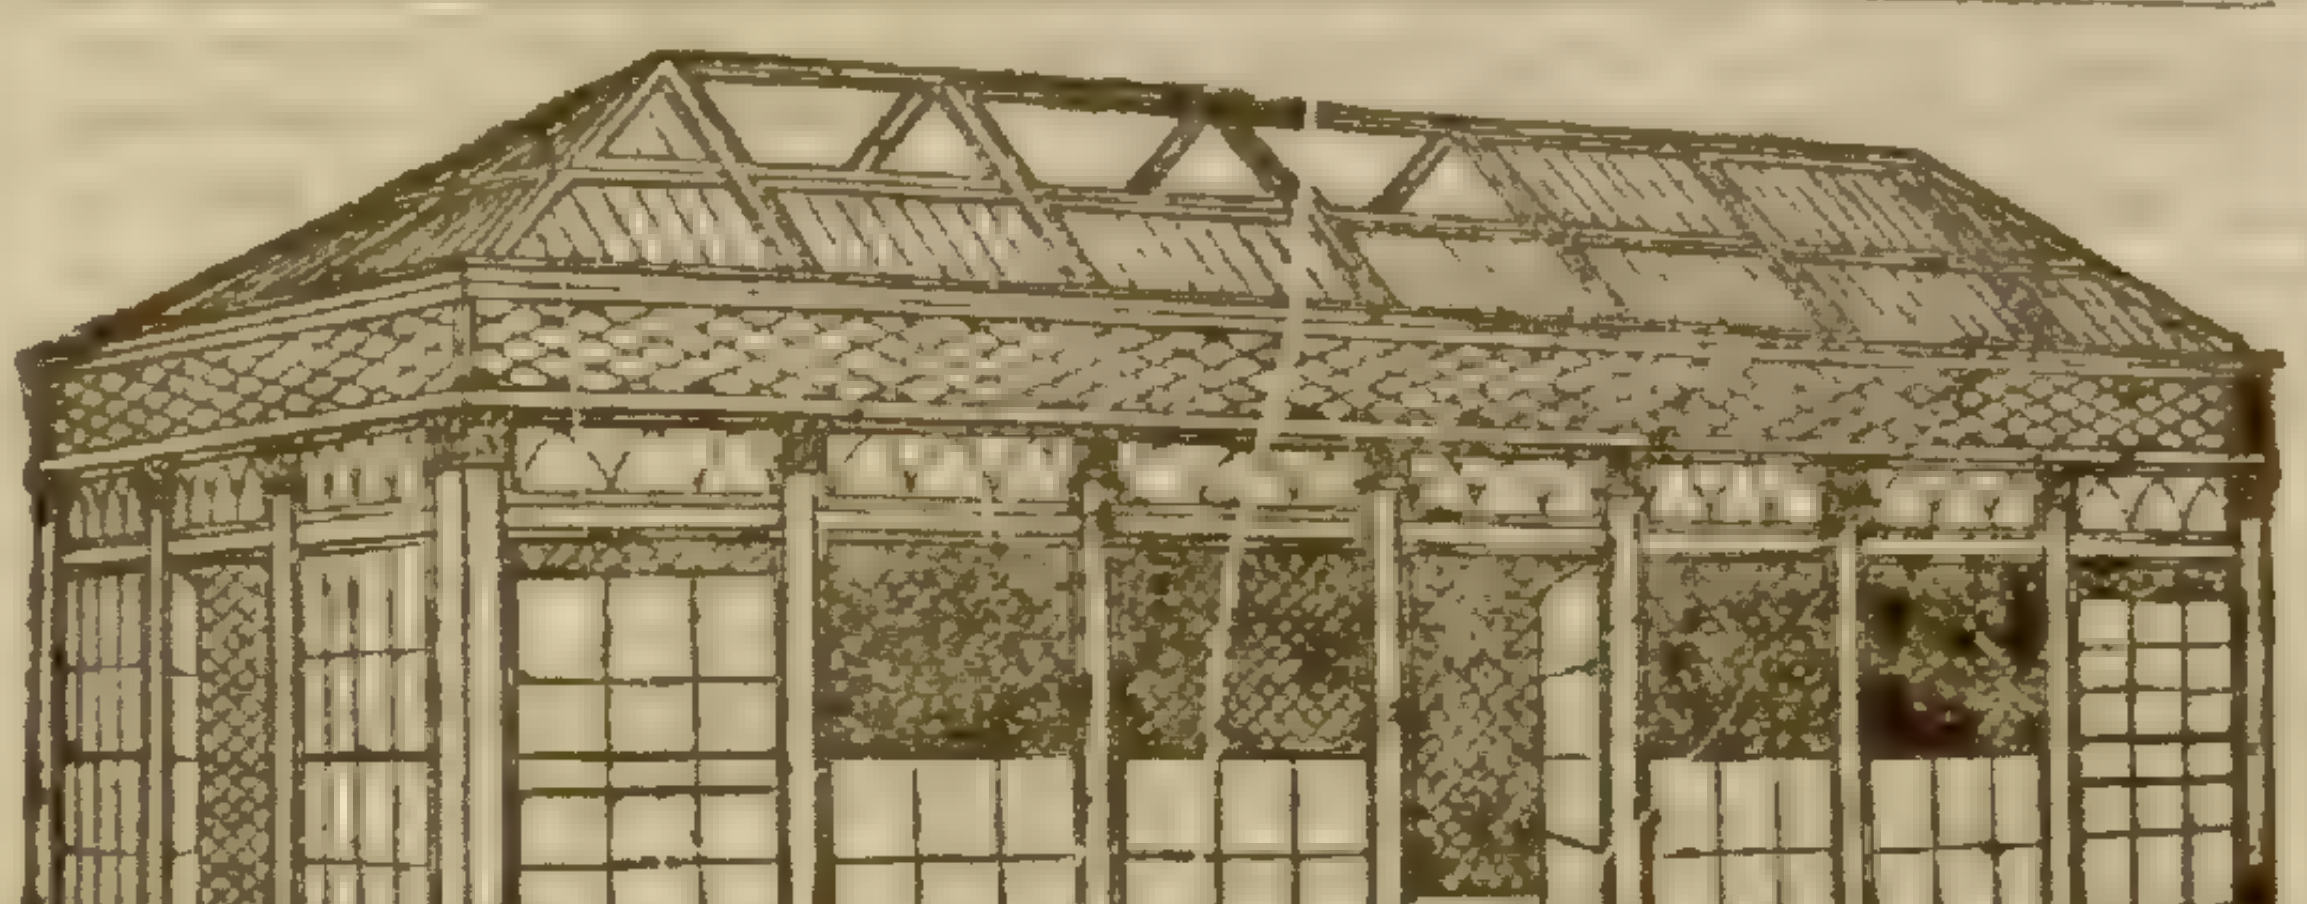
TO GENTLEMEN, NURSERYMEN, and others.—LAVENDER-HILL NURSERY, WANDSWORTH-ROAD.—Mr. GEO. HAINES will sell by Auction, by order of Mr. William Pamplin, in consequence of part of his Nursery Ground being required for other purposes, on MONDAY, Oct. 10th, and two following days, at eleven o'clock, the Nursery Stock, which is particularly adapted for persons engaged in planting, comprising large Evergreens, Fruit and Forest Trees, and Flowering Shrubs; Fine-grown Laurustinus, Laurels, Arbutuses, Evergreen Oaks, Phillyreas, Aucubas, Cedars of Lebanon, Hollies, Rhododendrons, Spruce Firs, and other Shrubs; choice Standard and Dwarf Peaches, Nectarines and Apricots, Mulberries, Figs, Vines, Ivy, Box Edging, large Aloe in tub, and a general assortment of young Nursery Stock. May be viewed three days previous to the sale. Catalogues to be had on the premises; at Messrs. Menier and Co.'s, 63, Strand; Messrs. Shepard's, 99, New Bond-street; at the Office of *The Gardeners' Chronicle*; and at Mr. Haines's Offices, Knightsbridge, and at Pimlico.

TO GENTLEMEN, FLORISTS, NURSERY AND SEEDSMEN, AND OTHERS.

THE Genuine STOCK IN TRADE of Mr. LYNN, Nursery and Seedsman, Bell-street, Henley, and Vines Hill, Remenham, together with the occupation of the Nursery Ground, till Lady-day, 1845, will be offered for absolute Sale by Auction, by JAMES CHAMPION, on Thursday, 6th October, 1842, and following day, at 11 o'clock precisely each day, as the Lots are numerous. The Sale will commence at the Shop in Bell-street, near the Obelisk, with the Stock of Garden and Flower Seeds, and Bulbs of the most approved kinds (warranted as described), Shop Fixtures, viz., Counter, Desk, 4 nests of Drawers, Seed-Boxes, Shelves and Fittings, Weights and Scales; Corn and Seed Measures, from a bushel to a pint; Clever Pony, Cart and Harness, Saddle, Bridle, Wheel, Hand and Box Barrows, Truck, Tub, and Box; Six Store Pigs, Pig Troughs, Hurdles, Glass Bottles and Baskets, Half-tester Bedstead, and other Furniture; 5 Sacks of Walnut-leaf Kidney and Early-frame Potatoes, &c., &c.

The Stock and Property at Vines Hill Nursery (entrance at the foot of Remenham Hill) comprise 48 Hand Lights, 3, 2, and 1 Light Melon Frames, 8 and 5-light Pits and Sashes, 2 small Greenhouses recently erected; Hot Water Pipes, Saddle, Boiler, and Furnace; a 45 ft. Shed, slate roof, sashes, and partitions; good assortment of named Standard and Trained Fruit and Forest Trees, Hedges and Rows of Arbor Vitæ, Laurels, Red Cedars, Laurustinus, Firs, Irish Ivy, Box, Holly, Yew, Whitethorns, Privet, Phillyreas, Arbutus, Tulip, Pyrus Japonica, Roses; Dutch Honeysuckles, Trumpet do., Lonicera flexuosa, Dahlias, American Plants, Althæas, Sweet Bays, Aucuba, and Yellow Jasmines, Virginian Creepers, Spiræa bella, Syringa grandiflora, Blooming Camellias, and many other scarce plants; quantity of Pelargoniums, Cactuses, Myrtles, Verbenas, Fuchsias, and many others; Box and Thrift Edgings; Gooseberry, Currant, and Raspberry Bushes; Asparagus and Sea-Kale Plants; Rhubarb, Strawberry, and other Plants; large quantity of good Manure, Road Stones, 2000 Flower Pots, &c. &c. Five weeks will be allowed to clear the lots.

May be viewed three days previous to the Sale, and Catalogues Sixpence each (without which no one will be admitted, returnable to Purchasers), may be had on the Premises in Bell-street, and Printing Offices, Henley and Wallingford; the "Gardener's Gazette" Office, 343, Strand; White Hart, Slough, Maidenhead, Reading, Dorchester, and Wycombe; Crown, Marlow and Benson; Journal Office, Oxford; and of the Auctioneer, Nettlebed.



HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

J. WEEKS and Co., ARCHITECTS, &c., GLOUCESTER-PLACE, KING'S-ROAD, CHELSEA, Hothouse Builders and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing Houses 300 ft. in length.

Their improved plan of BOTTOM HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's Seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are complete without furnaces or setting in brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 5*l.* 5*s.* and upwards. Further particulars, with plans and estimates for heating any description of building, may be obtained as above; where also may be seen the improved Wrought-iron Boiler, as applied with Chanter's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats. Iron Fencing, Hurdles, Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes.

N.B.—WAYTE'S New Patent Land-pressers and Drills.

TO GARDENERS.—WANTED, a middle-aged married man, without children, as Gardener, Groom, and general Servant; his wife a good Plain Cook, and capable of general household work; both respectable, industrious, trustworthy Servants. Apply, by letter, stating particulars of previous service, wages required, &c., addressed, A. B., Mr. Stubberfield's, Grocer, Hastings, Sussex.

WANTS a SITUATION as GARDENER, a respectable Young Man, aged 28, who has a perfect knowledge of the Forcing, Flower, and Kitchen Gardens, and can be well recommended from the situation he has just left, from which he can have two and a half years' undeniable character; likewise having lived in the first of families. A single-handed place objected to.—Direct to E. H., Elmer's End, Beckenham, Kent.

WANTS a SITUATION as GARDENER, or Under-Gardener, a young Man, aged 25; can have a good character from the place he has just left; understands the management of Cows; no objection to make himself generally useful. Direct to J. C., Mrs. Cooper's, Atlas-street, Royal Hill, Greenwich.

WANTS a SITUATION as GARDENER, a steady middle-aged man, who is well experienced in the business, and can have a good family character. Direct to J. W., A. Haines, Esq.'s, Kensal-green, Harrow-road, Middlesex.

WANTS A SITUATION, a GARDENER and his WIFE, without family: the Man is a steady, industrious, persevering individual, about 40; has had extensive practice in the Propagation and Growth of Fruit, Flowers, and Vegetables; can manage Land, Stock, &c., if required. His wife is a good plain Cook and Dairy-woman, and can take charge of the house. Address, G. Turner, Dennis Nursery, King's Road, Chelsea.

WANTED by a FOREMAN of a Gentleman's Garden a similar Situation in the Vicinity of London, or as an Assistant in the Floral Department of a Nursery; has had 10 years' experience, and can have a good Character from the Gardener he is now with. Wages, 15 Shillings per week, or an equivalent. Address Z. Y. X., Office of this Paper.

TO THE SEED TRADE.

WANTS a SITUATION as SHOPMAN, or UNDER SHOPMAN, in a Seed Warehouse, a Young Man who is well acquainted with the business. Address, Prepaid, Mr. Cussons, Bookseller, Horncastle.

WANTS a SITUATION as GARDENER, or Gardener and Bailiff, an active, industrious single Man, 36 years of age, who perfectly understands his Business, having been brought up in it from a child, by his father; can manage a Farmyard, Grass-land, &c.; would have no objection to a single-handed place; can brew, if required. He can have a character of 4½ years from his last place.—Direct to J. C., 43, Liverpool-street, Bishopsgate-within.

WANTS a SITUATION as GARDENER, a young Man, aged 30; has a general and practical knowledge of his Business, and can have a long and unexceptionable character from the Gentleman he has just left. Wages, 1*l.* per week.—Address W. K., 3, Sutton-street, York-road, Lambeth.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their Manufactory.

HEATING BY HOT WATER.

JOHN WALKER, 46, St. John's Square, Clerkenwell, London, having been for many years extensively engaged in Warming Churches, Manufactories, Hospitals, Hothouses, Conservatories, and Private Houses, by means of Hot Water, either in Pipes or Pedestals, can confidently recommend this mode of heating in preference to any other. Numerous references can be given both in town and country, where he has successfully and satisfactorily applied it. Baths fitted up and heated in a superior manner. Orders executed in all parts of the Country with punctuality and despatch.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respectfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths, may be seen in use at his house upon application to the gardener.

TO THE FELLOWS OF HORTICULTURAL SOCIETIES.—The first Monthly Part of "THE GARDENER AND PRACTICAL FLORIST" contains many articles of the highest importance to Horticultural Societies throughout the Kingdom, with Diagrams to illustrate THE PROPERTIES OF FLOWERS AND PLANTS. Price 1*s.*—London: . Groombridge, 5 Paternoster-row; and sold by all Booksellers.

SURREY.—TO BE LET ON LEASE, a very elegant and compact RESIDENCE, situate on an eminence, rarely to be met with, within 7 miles of London; containing 3 lofty Sitting-Rooms, 7 Sleeping-Rooms, Kitchen, Scullery, and all convenient Offices; Coach-house and Stabling, with Man's Room and Loft over; a good Garden and neat Greenhouse. For terms, apply to Mr. Woolbert, 21, Lawrence-lane, Cheapside; or to Mr. Hicks, Builder, Tooting.

HORTICULTURAL SOCIETY OF LONDON.

NOTICE IS HEREBY GIVEN, that the NEXT MEETING OF THE SOCIETY in Regent-Street will take place on Tuesday, October the 4th, at 3 o'clock, P.M.

The Gardeners' Chronicle.

SATURDAY, SEPTEMBER 24, 1842.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Tuesday, Sept. 27 .	Floricultural	7½ P. M.
— Oct. 4 .	Horticultural	3 P. M.
	Floricultural	7½ P. M.
Saturday, Oct. 8 . .	Royal Botanic	3½ P. M.

COUNTRY SHOWS.—Sept. 26, Newcastle. 27, Tamworth. 28, Brighton.

EVERYBODY knows how often the newspapers of the day contain descriptions of gigantic fruits and vegetables. Every Christmas we hear of Norfolk Turnips, large enough to hold a hare and brace of pheasants; and every summer some most prodigious Pippin is the subject of an hour's wonder. Unfortunately, however, there is rarely any guarantee of the truth of these statements; and many can, we fear, be traced no further than the inventive genius of some hanger-on of the daily press.

It is certainly worth knowing to what size a given vegetable production can be brought by skilful cultivation. To be *certain* that one man has grown a Pine-apple as large as a sugar-loaf, another a bunch of Grapes such as the spies brought out of Canaan; a third, a head of Celery, like the bowsprit of a yacht; and a fourth, such Cabbages as would realise the fables of the Frenchman, who asserted that *his* would form a goodly avenue to a country mansion, is not only amusing, but has its practical use. In this way, a real standard of perfection is furnished, towards equalling which all gardeners may strive, if such is their taste, with some prospect of success. But so long as these tales rest upon unauthentic evidence, they are of no value; one cannot be certain that they are true, and consequently they excite no emulation; for he would be a very foolish person who should waste his time in attempting impossibilities. No one now thinks of extracting sunbeams out of Cucumbers.

In order, therefore, to furnish accurate and authentic information upon these points, we have determined upon endeavouring to render *The Gardeners' Chronicle* a faithful record of all cases of extraordinary size or weight which may be sent to our office. At that place they shall be weighed, measured, and entered in a book; they shall also be published in our columns, with such information as the senders may afford, or such observations as our examination of them may suggest; and if the owners will allow it, they shall remain in our office for the inspection of the curious. To this plan we set no other limit than that the specimens to be reported upon shall be produced in gardens or cultivated ground; but whether the specimens are Apples, Cucumbers, Pine-apples, Cabbages, Potatoes, Onions, Mushrooms, or any other sort of garden stuff, they will equally come within our object. We only require that they shall be sent to us and, if taken away at all, removed at the expense of the owners.

RATHER more than a year ago, we informed our readers that His Grace the Duke of Devonshire had most liberally placed at the disposal of the Horticultural Society of London an annual sum for the encouragement of researches into the Chemistry of Horticulture. Other sums having been subscribed by a few Fellows of the Society, so that the experiments might not be an expense to those who are uninterested in such inquiries, a committee was appointed, and the investigation was entrusted to Mr. Edward Solly, jun., whose interesting lectures upon the subject, given last spring in the meeting-room of the Horticultural Society, we very briefly reported at the time.

Considering the extreme slowness with which all investigations in analytical chemistry are necessarily conducted, we hardly anticipated any results during the present season. We have, however, before us the first report of the committee, which contains some exceedingly curious matter.

One of Mr. Solly's inquiries was into the action on plants of sulphuretted hydrogen, that gas which gives its most offensive smell to manure, and which it is always the endeavour of gardeners and farmers to get rid of. Up to the present time it has been believed that it is very pernicious to plants. It evidently acts on plants as a venomous vapour, says M. De Candolle (Phys. 1363); it destroys plants when mixed with the air in small doses, and is chiefly inhaled at night, adds the same author in another place (p. 1372), judging from some experiments of the Genevese chemist Macaire. Sulphuretted hydrogen was said by Messrs. Turner and Christison to act more slowly, but not less surely, than some more active agents, causing the leaves to hang down perpendicularly, and become flaccid, and eventually destroying the plant. Liebig broadly states that one of the chemical forms in which this agent exists is a deadly poison; and acting, it may be presumed, upon such assertions, the proprietors of gas-works have been exposed to actions from their neighbours to recover compensation for some supposed injury done to their gardens. One would imagine that statements in which great authorities thus concur *must* be well founded. Mr. Solly's experiments, however, by no means confirm them. On the contrary, it would seem that sulphuretted hydrogen gas acts decidedly in a beneficial manner. He says—"I made use of the hydrosulphuret of ammonia, the very compound described by Liebig as being a 'deadly poison;' but in place of killing plants, I found that in small quantity it produced decidedly beneficial effects; in some cases when it was applied to plants, in an unhealthy state from the action of other substances, it had the effect of invigorating them, and of restoring their leaves to a healthy, green, and crisp condition. The plants with which these effects were best observed were the Garden Lettuce and the common Windsor Bean. The solution of the hydrosulphuret of ammonia employed was prepared by mixing a saturated solution of the compound with fifty times its bulk of water: such a solution had a most nauseous, disgusting smell, and contained of course a large quantity of sulphuretted hydrogen. The plants under experiment were selected from many, and were of the same age and size, and as far as possible of the same healthy state of growth. Some were watered with common water, others with a dilute solution of hydrosulphuret of ammonia. At first only a few drops of the solution were given; but finding that this produced little or no effect, the dose was increased, and as much as half an ounce a day, and sometimes even more, was given to each plant. It was found that those thus treated became stronger and sturdier; their leaves were of a bright deep green; the space between the nodes, or the distance from leaf to leaf, was shorter, and the stems were stronger and the whole plant more flourishing than in those watered in the ordinary way, although all other circumstances were alike, and care was taken to place all under the same condition, by exposing them equally to air and light, and giving them the same quantity of water every day. Plants in a languid state from over-doses of nitrate of potash, or soda, or other saline manures, if not too much injured by their previous treatment, appeared to recover more rapidly when watered with the solution of hydrosulphuret of ammonia than when merely treated with common water. In some of these latter cases a much stronger solution was employed than that already mentioned, containing two drachms of the saturated solution of hydrosulphuret of ammonia in fifty of water, and of this eight drachms were given daily. For some time after thus watering the plants, the earth retained a strong smell of sulphuretted hydrogen, and the water which drained through, when tested by a salt of lead, evidently contained a large quantity of that gas."

This is a discovery of no small importance. It is well known that one of the most active of all manures is the gas liquor, and its effects have been of late ascribed to the ammonia it contains. But who shall now say that it is not the sulphuretted hydrogen which it liberates so plentifully? and if so, what a change would be produced in the views of chemists, as to the agents which it is requisite to preserve in manure?

We must confess that the statement about sulphuretted hydrogen being poisonous to plants always appeared to us apocryphal, for these reasons—that it necessarily exists in the atmosphere, being given off incessantly by putrid substances, and that it is most abundant in the most active of all manures. The error that seems to have been committed by the chemists who investigated its action, appears to have arisen from their submitting plants to too large a dose of it. Carbonic acid, well recognised as the principal substance of plants, will kill them in doses not very considerably greater than that proportion which nature provides; and we ourselves should perish under excessive quantities of even the most nutritious of our daily food.

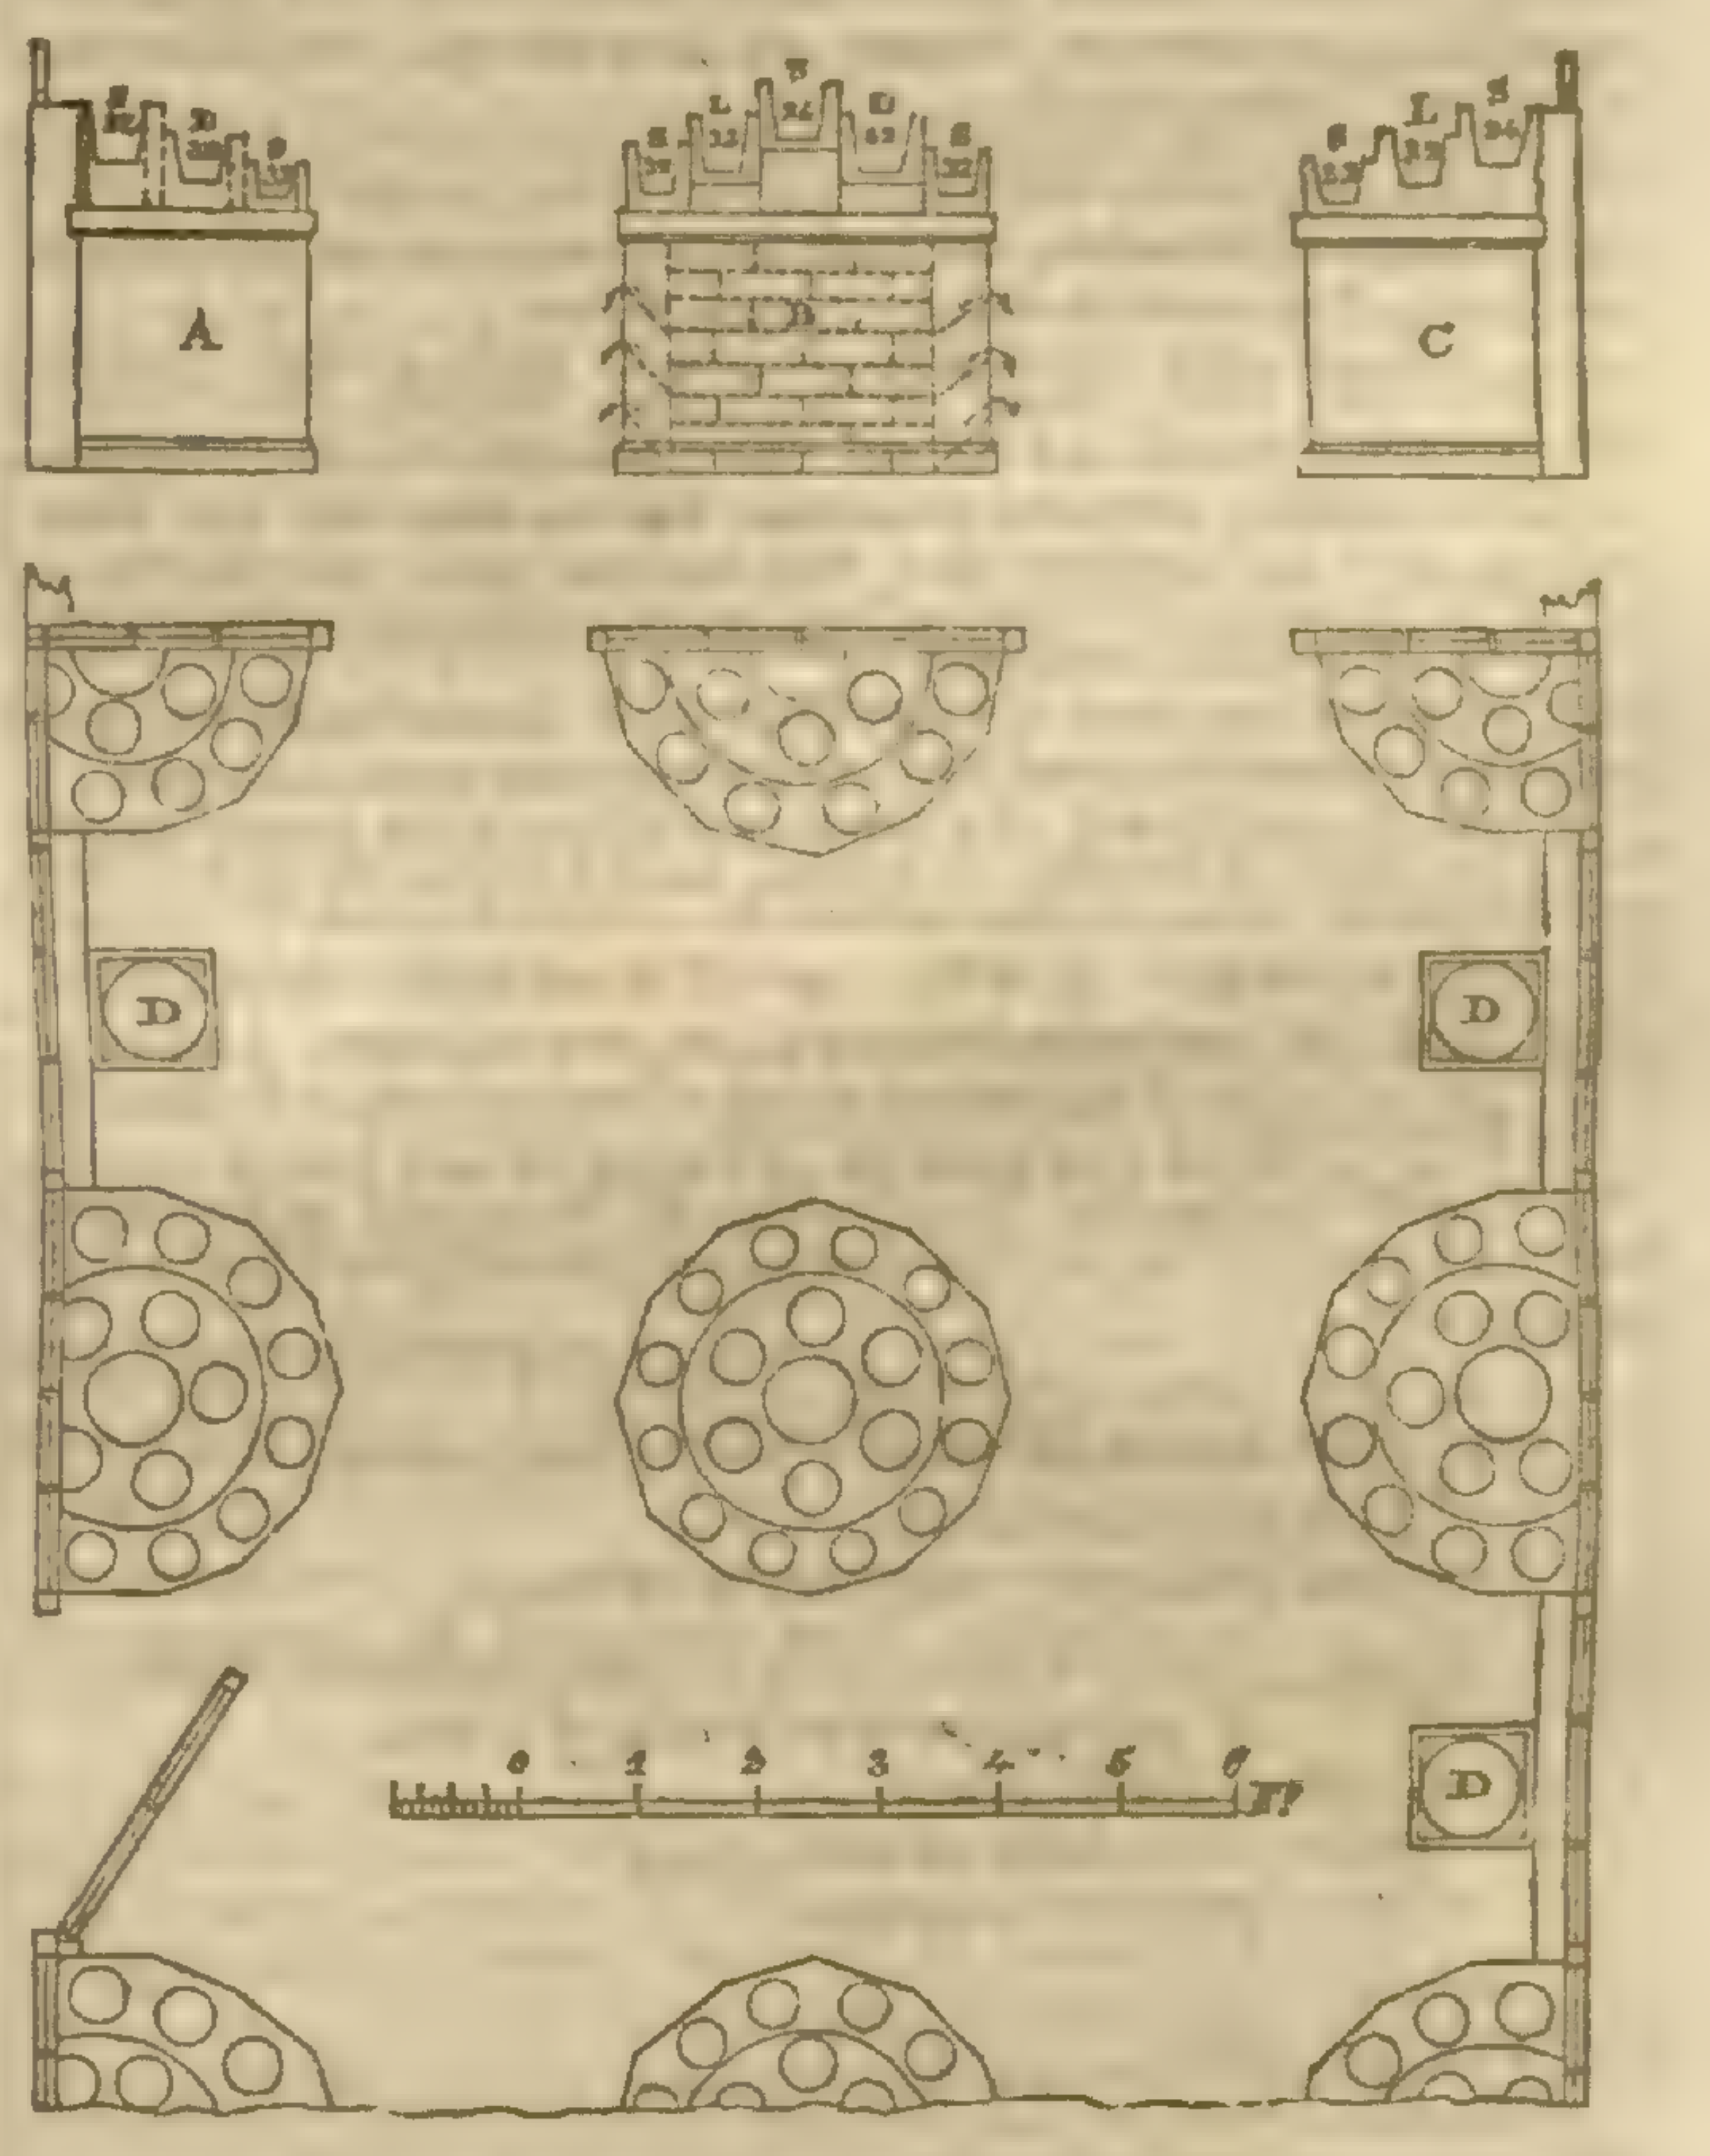
As Mr. Solly justly states, this unexpected fact, that sulphuretted hydrogen acts beneficially upon plants, necessarily leads to the inquiry whether sulphur, as a valuable fertiliser, has not been overlooked. Several instances have been mentioned in our columns of sulphur having proved beneficial to plants in a marked manner, and it is extremely well worth inquiry whether it cannot be added advantageously to manure heaps and compost beds. Sprengel says that coal-ashes containing much sulphur are employed in the preparation of some of the German patent manures; and we would advise our experimental readers to keep this in mind. It must, however, be employed only in very small quantities.

ON THE CONSTRUCTION OF STAGES FOR GREENHOUSES, &c.

THE construction of stages for Floricultural buildings appears to be susceptible of great improvement: the common plan of placing shelf above shelf, like a series of steps to the entrance of a house, is anything but ornamental; and one would suppose that the object of such an arrangement, was to make the pots as much a feature in the display upon them, as that of the plants themselves. The great number of the latter seen at one view distracts the eye; and many are necessarily placed so high upon the stage, as to be beyond the view of the spectator.

The first object in the construction of stages should be to have them so constructed and situated, as to afford facilities for grouping plants; the second should be, to give plants more the appearance of growing in borders, than upon artificial structures, and the third, to keep the pots out of sight—this is requisite for two reasons: first, because they are no ornament, and secondly, that it is always desirable to protect the plant from being scorched by exposure to the sun. It is also desirable to adopt another mode of construction, for the purpose of giving plants that aspect which is most suited to their habits; and, therefore, instead of placing the stages from the front to the back of the house, as is generally the case, I would place them in groups of stages: thus producing an effect similar to the borders in a well-arranged flower-garden. The spectators, in their progress from group to group, would be attracted by the separate display in each, instead of having their attention drawn away by a whole blaze of beauty at once.

The accompanying drawings represent the manner in which I propose that such stages as have been described should be constructed and placed in any Floricultural building. The ground-plan represents part of the floor of a house, 19 feet by 13, on which are planted 12 stages and 3 vases (D, D, D), basins, or any other suitable ornamental article, with a gangway betwixt them, 3 feet wide. The plan also shows sections of three different modes of constructing the stages, and the position of the pots in each; all the stages stand upon stone tables, resting upon brick piers, the top of each table being 2 feet 2 inches above the level of the floor.



In the stage A there are no shelves; the pots being plunged into cylinders (made of the same material as flower-pots) standing upon the tables—as shown by the dotted lines; the space all round them being filled with compost level with the rim of each series of pots. The object of this plan is to afford opportunities of planting various creepers and small bulbs betwixt each of the potted plants, for which there will be plenty of room when they stand 12 inches apart from stem to stem. The pots are supposed to rest by their rims upon the edge of the cylinder, and may of course be removed with the greatest facility.

In the centre stage, B, the supporters stand directly upon the table, and are cemented to it, the space between each being made water-tight, and filled up solid to within half-an-inch of the bottom of the pot. If an inch deep of water is poured into this space, the pot will be immersed half-an-inch; a small hole in the side will regulate the height of the water-line, and another in the bottom will draw off the water when it requires changing. This mode of construction may be adopted for such plants as need large supplies of water.

The stage C is supposed to have shelves pierced with holes to receive the pots, which rest upon their rims. The stages in my little greenhouse are so fitted up, and have been seen by many practical men, who prefer this plan of plunging the pots into the stages to the old one of setting them upon the shelves. The fronts of the stone tables may be variously ornamented: those in one house having trellised pannels, another having rusticated courses of brick or stone, while a third may be in imitation of rustic basket-work, and a fourth in rough courses, like small rockeries, with spaces between for creepers, orchidaceous or any other plants best suited to the purpose.

The dotted lines under the stage B will give some idea how this may be done; various other modes of ornamenting may be adopted, according to the particular taste of the individual. The vases, &c. D, D, D, may be filled with climbers for the open space against the sides of the house, and with creepers to hang over the edges. The flower-pots intended to be used in such stages as have been described, should be gauged before the plants are put into them, and all those rejected which do not fit the holes; the waste ones will answer for propagating, &c.

I have mentioned that bulbs might be planted between the plants in stage A; but, at the same time, I am aware that they cannot be transplanted by lifting the bulbs, as is done with the other plants. Could it not be done thus?—provide bottomless pots, or rather cylinders, about 2 inches in diameter inside; place a number of these upon a piece of slate, and plant a suitable-sized bulb in each, (of course various-sized cylinders would be required,) then fill up the space betwixt the cylinders with ashes, or other material; when they have got well established, shift them into the stages, and after they have flowered, remove them to ripen off. The cylinders should be deep enough to hold some of the earliest-formed roots, which would not be disturbed by the removal.

Being but an amateur, my suggestions may not be altogether correct; but I shall be glad if this attempt to improve the construction of stages in Floricultural buildings is succeeded by other articles on the same subject, from some of your able correspondents, as such a discussion must lead to some practical improvement in them.—*H. L.*

ON ANIMAL MANURES.—No. I.

(By Professor Charles Sprengel. Translated from the German.)

Animal Offal.—All animal remains, with the exception of their excrements, are comprised under the above denomination. Animal offal is a very powerful manure, a circumstance which is to be ascribed to its being composed of substances which, even in small quantities, advance vegetation in a very powerful manner. It contains, besides some other elementary substances, a great quantity of nitrogen, sulphur, phosphorus, and chlorine, of which it was stated previously, that even the smallest quantities perform an important part in the nourishment of plants. But it is especially the nitrogen, which renders offal such superior manure. Moreover, animal offal contains these substances in such combinations, as are either by themselves very soluble in water, or as, by their decomposition, form substances which require an equally small quantity of water for their decomposition, which circumstances, however, cause its action to be very transient. In all places where agriculture is in a high state of perfection, animal offal is carefully collected and used as manure, whilst it is neglected in countries where farming is carried on without intelligence; in such places it is not considered worth while to carry on the land small quantities of matter, because it is believed that the value of manure consists in its mass. Amongst the most valuable kinds of animal offal are the following:—

1. *Carcasses of Dead Animals.*—Carcasses consist of bones, flesh, fat, and other soft parts. The flesh contains, according to chemical analysis, in 100,000 parts, on an average—

77,170	parts of water,
15,800	*muscular fibre, vessels, and nerves,*
1,900	cellular tissue,
2,200	albumen, and serum of blood,
1,800	osmazome, with a little lactite of soda, potash, and chloride of lime.
0,150	mucous matter,
0,900	phosphate of soda, and
0,080	phosphate of lime.
100,000	parts.

The muscular fibre, vessels and nerves, the cellular tissue, albumen and serum, osmazome and mucous matter, are those substances of the flesh which contain abundance of nitrogen, sulphur, phosphorus and chlorine, and possess a high value as a manure. Of much less importance is the fat, which, in its pure state, consists only of carbon, hydrogen and oxygen; and it would be still less worth if there were not the cellular tissue, in which the fat is contained, to which the manuring quality of the refuse of the tallow-melter is to be ascribed.

The flesh of animals dying a natural death soon passes into a state of putrefaction, as it is not deficient in water, and it developes during that process a great quantity of ammonia, phosphuretted hydrogen, and some other putrid gases, not yet sufficiently known; if, therefore, nothing of these substances is to be lost, it must be as soon as possible mixed with matters which are able to receive and chemically bind the gases thus developed. In Belgium the flesh of dead animals, or such as have been killed on account of being diseased, is cut immediately into small pieces, which are divided over the field, and soon covered by ploughing them in. Against this procedure nothing can be said, provided the soil contains much humic acid, by which the developed ammonia can be chemically fixed. Still it is better to cut the flesh of carcasses in small pieces, and put it, with moist soil rich in humus, into a hole where it may rot, by which means all the ammonia will be chemically fixed. The bones also, which do not require to be bared of flesh, may be equally placed in the hole, and afterwards taken out and used by themselves. We generally find it stated that carcasses should be mixed up with quicklime, and thrown into a ditch, where they may decay; but this occasions a considerable loss of fertilising materials, because the greatest portion of the nitrogen escapes. For if a portion of it combines with the oxygen of the atmospheric air, and forms nitric acid, which may enter into chemical combination with lime and ammonia, and so becomes nitrate of lime and ammonia; still, the most of the nitrogen combines with hydrogen, and escapes under the form of ammonia. If nitrogen is not to be wasted, no lime should be added, nor is it at all necessary, if the carcasses have been mixed with soil rich in humus. It is true, that lime prevents the formation of phosphuretted and sulphuretted hydrogen gases, because by its presence phosphoric and sulphuric acid is generated out of the phosphorus and sulphur; but soil rich in humus will also (if not employed in too small a quantity) secure the putrid gases just as well; and as this kind of soil is by no means destitute of bases, sulphuric and phosphoric acid will in this case also be generated.

The *Entrails* of dead animals are to be treated in the same way as the flesh, if they are to yield the greatest advantage as manures. After they have been frequently worked up with humous soil, and are properly decayed, they form an admirable topdressing; but must always be employed in small quantities, or they will make vegetation push much too luxuriantly.

(*To be continued.*)

FAMILIAR BOTANY.—No. X.

Do Plants breathe?—To be sure they do, as much as you or I, or any other creature; and they are just as liable to suffocation. The keeping plants alive for a long time in Ward's cases is no proof to the contrary, for fresh air is always finding its way into the inside of such cases, in spite of all you can do to exclude it. As to plants which have been preserved for months in a bottle, with a bladder tied over the mouth of it, they too get at fresh air. Besides, there is another reason why plants can live in such confined places: they purify their own atmosphere, more than they vitiate it. In this respect they are very different from animals, which vitiate only. When a plant breathes, it makes use of its skin, for you know it has no mouth, and through all parts of its skin, where it is green, is air flying off and rushing in incessantly.

All that the plant really wants is a little food, which is supplied by water with a small quantity of common soil, and plenty of light—the more the better. You have no idea how a plant rejoices in the light, how fast it feeds, how fast it digests, and what a thrill of delight passes through it when the first sunbeams strike it in the early morning, after a long night's rest. Only call to mind the gay flowers, the rich green leaves, the sturdy happy-looking bushes that skirt the steep bank of a rivulet, or an open-forest glade facing the east, and compare them with the weakly, slender starvelings that are stretching upwards in the gloomy shadows of the choking plantation; and you will see how important to the health and comfort of a plant is the sunlight, and how thankful it is for the vigour that is there infused into it. But plants are like animals; they may be killed by that which strengthens them, if unskilfully administered. The sunbeams which cherish a plant will also rob it of its moisture; and if the robbery is prolonged too much, it will die of dryness. That is what nature always tries to prevent, and what we also must take care to oppose. In its native seat there are the dews of heaven, the drops that sparkle on the leaves in the morning, the mists and the plenteous showers which are bountifully furnished by nature for the welfare of plants, and to surround them with a moist atmosphere, such as the sun cannot exhaust before it is restored again. All these things, or at least their substitute, must be provided when plants are made to live in closed-up places. Thus provided, they will travel to great distances, and endure a confinement of many months' duration. Light, moisture, and a little earth, are all that a plant, shut up in a bottle, needs for its sea-stock; but these it must have. There once was a foolish captain who received on board his ship a box of various plants for his friends on the other side the world; it was glazed with beautiful plate glass, and made tight by all the means which ingenuity could suggest. The Captain saw it, and admired it, especially the transparency of the glass, and the fresh and healthy plants that could be seen so plainly through it. As the voyage was to be a long one, he ordered the box to be carefully deposited in the hold of the ship. This Captain often bethought him of the box, and the charming plants that were trained up within it, and of the delight it would afford his friends when he should present it to them, filled with the gay flowers of their own dear native land. At last the voyage drew to a close, and the box was ordered upon deck, when, lo! of all the fresh green plants that it originally contained not one remained. In their room was darkness, and blackness, and decay; the very glass was dimmed by the slimy remains of the perishing flowers, which had clung to it when they died, as if they knew how kind a guard it was intended to have been to them. The Captain was dismayed, and blamed the people who packed the box, and the long, long voyage; he never thought of blaming himself, nor of his folly in putting into the dark what had been so carefully glazed to admit the light. What would he have thought if he had been himself locked up in a sea-chest all the voyage? Light is life—but more so to plants than to any other living things.

When care is taken to use a white bottle, with a piece of damp sponge and a little earth in it, and to place it in all the bright light of the sun, plants may be carried alive in safety half round the world. It was in this way that the Primrose is said to have been first conveyed to New Holland by a lady, and as it so happened that it was beginning to bloom when it arrived, the interest excited by the event was quite extraordinary. Such crowds, indeed, are said to have welcomed its landing, in their eagerness to catch a glimpse of the well-remembered stranger, that a guard was placed over it to protect it from injury. A little poem upon this incident has been published in "Ainsworth's Magazine," which is so beautiful that I cannot but introduce it, notwithstanding its length.—*R. E.*

Australia's strand was swarming
With myriads, tier on tier;
Like bees they clung and cluster'd
On wall, and pile, and pier.

The wanderer and the outcast,
Hope, penitence, despair,
The felon and the free man,
Were intermingling there.

There ran a restless murmur,
(A murmur deep, not loud,
For every heart was thrilling,)
Through all that motley crowd.

And every eye was straining
To where a good ship lay,
With England's red cross waving
Above her decks that day.

And comes she deeply freighted
With human guilt and shame?
And wait those crowds expectant
To greet with loud acclaim?

Or comes she treasure-laden?
And ache those anxious eyes
For sight of her rich cargo,
Her goodly merchandise?

See! see! they lower the long-boat,
And there — they man the barge—
Trick'd out and mann'd so bravely
For no ignoble charge.

Gold gleams on breast and shoulder
Of England's own true blue;
That sure must be the Captain,
Salutes his gallant crew.

And that the Captain's Lady
They're handing down the side—
"Steady, my hearts! now, steady,"
Was that the coxswain cried?

"Hold on!" She's safely seated.
"In oars!" — a sparkling splash—
Hats off on deck — one cheer now—
"Pull, hearties!" — off they dash.

And now the lines long stretching
Of eager gazers, strain
(Converging to one centre)
The landing-place to gain.

"A guard! a guard!" in haste then
The Governor calls out—
"Protect the lady's landing
From all that rabble-rout."

Her foot is on the gunwale—
Her eyes on that turmoil—
She pauses so a moment,
Then treads Australia's soil.

With looks of humid wonder
She gazes all about;
But, oh! her woman's nature
Calls that no "*rabble-rout.*"

For well she reads the feeling,
Each face expressive wears;
And well she knows what wakes it—
That precious thing she bears.

That precious thing—(Oh, wondrous!
Oh, spell of potent power,
From English earth transported!)—
A little lowly flower.

Be blessings on that Lady!
Be blessings on that hand!
The first to plant the Primrose
Upon the Exile's land!

The sound had gone before her—
No eye had closed that night;
So yearn'd they for the morrow,
So long'd they for the light.

She smiles, while tears are dropping—
She holds the treasure high;
And land and sea resounding,
Ring out with one wild cry.

And sobs at its subsiding
From manly breasts are heard;
Stern natures — hearts guilt-harden'd,
To woman's softness stirr'd.

One gazes all intentness—
That felon boy—and, lo!
The bold bright eyes are glistening,
Long, long unmoisten'd so.

The mother holds her child up;
"Look, little one!" cries she;
"*I* pull'd such, when as blithsome
And innocent as thee."

No word the old man utters—
His earnest eyes grow dim;
One spot beyond the salt-sea
Is present now with him.

There blooms the earliest Primrose,
His father's grave hard by;
There lieth all his kindred—
There he *shall* never lie.

* * * * *

The living mass moves onward,
The Lady and her train;
They press upon her path still,
To look and look again.

Yet on she moves securely,
No guards are needed there;
Of her they hem so closely,
They would not harm a hair!

Be blessings on that Lady!
Be blessings on that hand!
The first to plant the Primrose
Upon the Exile's land!

AMATEUR'S GARDEN.—No. XXXIX.

Window plants, which were recommended to be placed in a partially shaded situation during the hot summer months, may now be fully exposed to the sun. If this is not attended to now, they will soon become drawn and weak; they will also be less able to withstand the winter, and will not flower so well next year. Those in Ward's cases should be carefully examined from time to time, and the strong-growing kinds kept from destroying the weak ones. For this purpose, the case ought always to be constructed so that every part of it can be readily got at by means of a door in front. Some persons are averse to having doors in such cases, because they will not then be air-tight; but a little consideration will convince any one that these things cannot possibly be air-tight, even if they have no door; their chief utility, therefore, consists in preserving a moist atmosphere around the plants—which suits their consitutions much better than the dry air of a sitting-room; and this can be preserved nearly as well with a good-fitting door, as if the case had been made without one: the plants will, moreover, be better attended to, because they are easier to get at.

If the directions have been attended to, which were given some time ago, respecting the cutting down and the repotting of Greenhouse Pelargoniums, they will now be in a condition for removal into the house. They should be placed thinly, as near to the glass as possible, and have plenty of air in the night as well as in the day, until the frost renders it unsafe to have the sashes open at night. If there are grapes in the greenhouse which are not quite ripe, the plants may be allowed to stand for a short time longer in the open air; in this case, however, they ought to be fully exposed, and the pots so placed that the worms cannot find their way into the soil. Pot off the young plants, which will by this time be rooted, and keep them in a close and shaded situation for a few days, until they form roots in the fresh soil; they may then be treated in the same way as the older plants, and they will make neat flowering plants next year. They will not be so large as the older specimens; but, unless for the purposes of exhibition, I cannot but think that it is only a waste of time and room for the amateur to attempt to grow them to any great size, particularly as he can have a much greater variety if he grows young plants in small pots. Hydrángeas, and many other things which were recommended for propagation some time since, should be potted off without delay, and they will become established and strong before they are removed to their winter quarters.

In the flower-garden it will be necessary now to see that strong-growing things, such as Petúnias and Verbenas, do not grow over and choke others less robust; where this is the case, the former should be cut away, in order that light and air may be admitted. Attention of this kind is particularly necessary in a rockwork, where such things are planted in summer merely to fill up the vacancy, until the rock-plants are large enough to cover it themselves. The strange intruders frequently monopolise the whole, and when they are destroyed by the frost of winter, it is often found that they have rotted our favourite rock-plants, instead of affording them protection.

As long as the fine dry weather lasted, the amateur was advised to lay in a stock of the different kinds of soils which he is continually in want of. Those who intend planting a bed or clump of Rhododendrons, and other American plants, should turn over and break up the peat which they will require for this purpose. Old soil, which has been lying in the compost yard for a year or two, is rather better than that which is fresh; but the latter will do if none of the other can be obtained. As these shrubs may either be planted in the autumn or spring, I will shortly give some directions for making the beds or clumps, and for planting them.—*R. F.*

HOME CORRESPONDENCE.

Colours of Flowers.—In a leading article in the *Chronicle* of 20th Aug. last, in endeavouring to explain the cause of the change of colour in the Phlox, you observe that the changes in the colours of plants generally are owing either to the absorption or exhalation of that all-important element, oxygen; and that the change in the colour of the Phlox from blue to red is on account of the liberation of the oxygen gas absorbed during the night, consequent on the action of the sun's rays on the petals of the flower, as proved from those flowers being the first affected which first come under the influence of that luminary. But on reading the chapter devoted to this subject in Professor Lindley's "Introduction to Botany," I find facts therein stated which I cannot reconcile with your theory. The author, it would seem, purposely avoids giving any direct opinion of his own, and publishes the discoveries of Schubler, Funk, and others whom I suppose we are to consider as "authorities" in the matter. The two former of these gentlemen consider, I believe, that the colours of all flowers may be divided into two grand series:—1. Those of which yellow is the type, and which is regarded as produced by chromule in an oxidised state, and which are capable of passing into red or white, but never into blue; and 2. Those of which blue is the type, in which they regard the chromule as having been deoxidised, and which may pass into red or white, but never into yellow: the former being called oxidised colours, and the latter deoxidised—Green being the point of equilibrium between the two. Thus we have

Green

Yellow Green.	Greenish Blue.
Yellow.	Blue.
Orange Yellow.	Violet Blue,
Orange.	Violet.
Orange Red.	Violet Blue.

Red.

Now if we regard the red colour, according to the theory of Schubler and Funk (and which is also, I believe, confirmed by Macaire), as produced by the further oxidation of the green and yellow, how can it also be produced by the deoxidation of the blue? that colour being, as I suppose, the minimum point of oxidation, and containing consequently less oxygen than any other. I should rather consider the change of colour in the Phlox to be due to an increased absorption of oxygen; but how that is attained during the day, if the petals, regarded as modified leaves, perform the like functions, and possess the same properties of decomposing atmospheric air, I know not. We find, moreover, that vegetable blues are turned red by acids, and that, too, in consequence of the oxygen contained therein. I shall feel particularly obliged if you would place me in the right path, as nothing to me is more disagreeable than "wandering amidst doubt," whilst a hint from an abler head may elucidate the whole.—*H. J. Turner.* [We can only repeat what was before stated, that very little is known about the causes of colouring in plants, and refer our correspondent back to the article on which he has commented, and to Professor Lindley's "Introduction to Botany," where he will find that the theory of Schubler and Funk is merely given *quantum valet*, and that Marquart objects to it altogether. Neither we nor any one else have the means of arriving at positive conclusions upon this obscure matter. Multiplied observations are indispensable; and until they have been made, speculation upon vegetable colours will be mere groping in the dark. The explanation offered in the case of the Phlox is very intelligible, and not at variance with any received facts, and is quite as likely to be right as any other.]

Change of Colour in the Flowers.—The mutability which characterises many flowers, and referred to lately by you, is a very curious, though a difficult problem. Temperature is singularly involved in the solution; though I would not venture to exclude the combined influences of atmospheric air and the electro-chemical action of light. When a leaf of red Cabbage is ruptured, the juice is blue; hence, the late Mr. Smithson imagined that the change arose from the escape of carbonic acid originally circulating in the plant; but I find that heat applied turns the blue to red; I also found that slips of paper dyed blue became red when heated, and that the effect remained; but when exposed to the cold, produced by radiation, the blue colour was restored precisely similar to what would have been occasioned by the effect of an alkali. I also discovered that a piece of ice changed a tincture of red Beet to brown—an alkaline effect also on vegetable colours.—*J. Murray.*

The Sunflower.—Your correspondent who doubts the truth of the poetical idea of the Sunflower following the sun, and then untwisting her neck and waiting for him in the other quarter, should remember that the genus Helianthus, being American, could not be the Sunflower of Ovid and Clytie, which I take to have been a Dorónicum. Now, I can answer for D. plantagíneum following Phœbus in the most persevering and faithful, not to say obstinate, manner. Probably many others of the family do the same.—*W. Fox Strangways.*

Summer Pruning of Pear-Trees.—In Nos. 34 and 35 of the *Chronicle*, Mr. Ayres has made some comments on my communications in preceding Numbers, respecting the summer pruning of wall-trees. As no other correspondent has offered an opinion upon the subject, I beg leave to say a few words in reply, hoping yet to make a convert of Mr. Ayres, although he has brandished his knife with some earnestness. He cannot reconcile the idea of broken branches (in a green state) for two or three months in a fruit-garden, however great the advantage may be in restoring barren trees to fruitfulness. If trees are not fruitful, of what use can they be, however neatly trained? At the proper season fruit is required there is but little in the garden, and neatly-trimmed trees are pointed out in compensation. I doubt much if superior neatness will atone for the want of fruit. The pleasures of gardening may be traced to mixed sources; and harmony in garden scenery is, I conceive, produced by a combination of parts, forming a whole; therefore, if the fruit-garden is not what it ought to be, a link is displaced in the chain. The object of the planter must be fulfilled, and the production of fruit should weigh down every other consideration; so that the first objection is, I think, removed. Secondly, Mr. Ayres thinks the pendulous shoots cannot benefit the tree by returning the elaborate sap. In this, I imagine, he is also mistaken, and that his conclusions are opposed to facts. In June the superfluous wood is broken down, by the finger and thumb, to within two inches of the base. This operation, though expeditious, must be done with care, so that each shoot may hang, in connexion with the tree, by about one-fourth of its substance. Nature soon partly heals this wound; the branches maintain a steady, graceful, and recumbent appearance for the summer, causing the walls to be an object of surprise and interest, and too regular in appearance to be unsightly; at least, so numerous skilful men have stated who have witnessed and now adopt the system in preference to any other. If Mr. Ayres will make a trial, he will find that the pendent branches of wall-trees are not so much blown about in the breezes of June, July, and August (not usually stormy months) as he supposes. They keep as healthy as any other part of the tree in appearance, increase in size very little, and rarely produce another leaf (after they are broken down). Does Mr. A. maintain that the secretions of these healthy leaves are not taken back into the tree by its superior attraction? These branches and leaves, cut off in the summer, must be a source of weakness to the tree; but retained, they clarify and return the streams of life, nourishing and reviving stunted flower-buds, and also assisting the eyes at the base of the pendent branches to make prominent fruit-buds, which the upper eye on strong spurs will do the first season, however startling the fact may appear. When the upper eye on the spurs of strong trees swells thus early, the lower ones generally form wood the following summer; in June they are broken down as directed, and by September the eyes on the spurs will be found healthy embryo fruit-buds. Therefore by this method of summer-pruning and judicious root-cutting, trees will be so strongly disposed to bear fruit, that an excess of wood the third season may not be expected; consequently a cause for Mr. Ayres's fear of overshading seldom occurs in practice. But should there be too many pendent shoots on any one part of a tree, the skill and good sense of the operator will show him where a few may be broken off (not cut) within two inches of the base. Upon the few spurs that I have occasion to shorten in this way, I rarely find the eyes left push into leaf that season, but they invariably do the second. This is another proof that the leaves on the pendent branches perform their functions freely, and that the early removal of summer wood is a source of evil. A tree, like an animal, is composed of several organs, each performing distinct functions, but all connected and contributing to one great end. The slightest derangement in this harmony may affect the health of the entire system. The leaf of a tree may be compared to the stomach, and the root to the mouth of an animal, the trunk of the tree to its body, &c. If the digestive powers of the stomach are impaired, illness and a waste of strength are the consequence in the whole system: the mouth closes against food, the body droops, and the limbs wither. So it also is with a tree; for in proportion to the number of leaves destroyed in an active state, its debility will increase: therefore I was rather surprised to find Mr. Ayres recommending something like the old system of mutilation for restoring barren robust trees to fruitfulness. The difference is, that he only cuts off a piece at a time. This reminds me of a servant, who had orders to cut a young dog's tail off; but his humanity was so great, that he determined upon taking off only a small piece at a time, and began with two inches. When the wound healed up, he removed another piece, and so on. However, the poor brute was nearly dead before he lost all that was necessary. Your correspondent says, that the use of the knife is the source of great prejudice among some practical gardeners; I agree that the knife is a most useful tool in the hands of a skilful operator, but, like other edged tools, should not be played with or used out of season. It is against the free and unseasonable use that practical gardeners have a prejudice. It is well known amongst them, that in summer-pruning the finger and thumb are preferable to the knife; this both practice and observation have established. Having now spoken on Mr. Ayres's principal objections, I will glance at a part of the system he recommends. First, he commences by cutting away three or four strong roots in the autumn; whereas, I begin with the branches the summer previously to the autumnal root-pruning: secondly, he allows his trees the next season to set a heavy crop of fruit, if he can get it; here he must have forgotten that the object of my article was the management of robust barren trees, so as to induce fruitfulness. To do this, I turn the gross productions of the trees into fruit-bearing wood during the first and second season, and into fruit afterwards. If he cannot get fruit, he cuts off more roots and disbuds, after stating, in the onset, that he disliked lacerating the bark by disbudding. He commences the summer-dressing by cutting off the young shoots to five or six leaves (about eight inches, I suppose). These foreright stumps will shade the tree more than my pendent branches; the sap will flow freely into the upper eyes, and, in strong trees, nature restores what man destroyed—an outlet for the sap in the shape of another shoot. But if the top should not thus grow into wood, but partake of the secretions moderately, the natural consequence is, that the resources of the tree are expended, chiefly in promoting the growth of these useless long spurs, only to be cut off by the knife (Mr. Ayres tells us) in July or early in August, retaining about two inches at the base with two miserable eyes, for up to this period that part of the wood removed by the knife was mostly benefited, and if the tree is not exhausted by root-pruning, the sudden impetus given to the remaining half-withered eyes will cause many to sprout; therefore, the embryo fruit-buds are not to be found so abundant as is supposed; whereas, the eyes on the spur of the pendent branches are certain to become fruitful, partaking so moderately of the secretions of the leaves. This opinion is not borrowed or far-fetched, but the result of long practice, experience, and observation. This system is applicable to all wall-fruit trees bearing on spurs; but I seldom have occasion to practise it on any but Pears and Filberts. I do not doubt that Mr. Ayres's system, like the common one, will answer in some soils and situations; but I doubt very much if it is so expeditious and certain as this.—*H. Bowers, Laleham.*—[With this communication, Mr. Bowers has forwarded a specimen exhibiting the eye upon a spur, immediately below where the shoot has been broken, converted into a prominent fruit-bud; proving that it is not impossible for blossom-buds to form upon such shoots during the same season in which they are bent down.]

Root-pruning Pear Trees.—When root-pruning Pear trees was first brought into notice, many cavillers asserted that under such treatment the trees would produce small and gritty fruit only. I have, therefore, thought proper to send you a few specimens from trees that have been root-pruned from five to seven years. The trees from which these specimens were gathered are not larger than a middle-sized Gooseberry bush; and yet they have produced from three to four dozen each. They are, I assure you, very interesting objects of garden culture.—*T. Rivers, jun., Sawbridgeworth.* [Amongst the Pears sent are, Beurrée Diel, Beurrée d'Aremberg, Marie Louise, Beurrée Van Mons, and Bellissime d'Automne; in each case the fruit is handsome, and, for standards, full sized without the slightest appearance of grittiness.]

Soham Gardens.—Your able correspondent, Mr. Ayres, is, I trust, labouring under a delusion, or his memory fails him, when he states that the proprietor of Soham has great objections to the gardens being seen. In an article which appeared in the "Gazette" a few years back, bearing the signature of "Cantab," it was stated that they would be gratified by any respectable person visiting the place, to see a system of covering pits and frames, invented by the said "Cantab."—*Veritas.*

Tobacco.—While upon the subject of weeds, I recommend you to direct the attention of your readers to that most offensive one—Tobacco. This morning I mounted a coach at early dawn to travel through a delightful country, and as we rattled out of the gateway of the old inn, I was anticipating those rural fragrances which, like the land-breeze to the home-sick mariner, recall to the mind the most delightful associations;—but, woe is me! upon the box immediately before me, sat a reverend gentleman, who soon threw a cloud over the whole prospect. May I ask, does it never occur to such persons, that the smoke and ashes of their cigars are offensive to the eye and noses of their fellow-travellers? that their filthy saliva, so unskilfully ejected as to be blown into their neighbours' faces, is exceedingly disgusting? It is no excuse to say—"I asked first if it would be disagreeable." I have heard a lady politely reply, "I beg you will not consider me," when she has afterwards acknowledged that the whole course of a romantic ride, which she has adventured outside to witness to greater advantage, has been a time of misery from this loathsome practice. Pray, sharpen your hoe, and eradicate as much as you can of this filthy weed.—*Antipuff.*—[With all the good-will in the world, we cannot undertake to meddle with the practice of Tobacco-smoking. If a knowledge that it induces apoplexy, and most undoubtedly affects the intellect injuriously, will not stop it, nothing that we could say would be likely to have the effect. There is but one cure, and that lies with the ladies. *Let all the gentlewomen in the country enter into a league to marry no one who smokes, and the fashion is gone.* To the Ladies, then, we must beg to intrust the eradication of Tobacco weeds, or to such of our correspondents as have more eloquence than we possess.]

To Destroy Wasps'-nests.—Some of your correspondents appear to be interested in devising an easy method of destroying wasps'-nests. Wishing to procure some specimens, I have lately tried the following plan with perfect success:—About ten o'clock at night, when the wasps have returned home, I place a small cup-full of spirits of turpentine close to the entrance hole, and cover it over with a flower-pot, having first stoppered the hole in the bottom. The effluvium from the spirits of turpentine penetrates to the nest, and stupifies or kills all the wasps. I did not venture to remove the flower-pot till 36 hours had elapsed, and then, by carefully digging, I procured some beautiful specimens, each attached to the roof of the vault in which it is suspended. We have here both the Vespa vulgaris and Vespa rufa. The nest of the latter is extremely fragile, being constructed entirely from the fibre of rotten wood, like that of the hornet. I place a bottle of beer and sugar near the spot, in order to attract the few stragglers who happen to be abroad at night, when the entrance is closed; and most of these are caught before I revisit the spot. Persons who wish merely to destroy the nests, need trouble themselves no further than to pour about half-a-cupful of spirits of turpentine into and about the entrance holes, and then place a flower-pan over it, and bank it round with earth.—*J. S. Henslow.*

The Bite of a Bug.—There are few, perhaps, that suffer more acutely from the incidental contact of that horrid pest, the Cimex lectulária, than myself; but I have always found that the application of soap relieved the irritation, and soon obliterated the "bump." The lather must, of course, be allowed to remain. No doubt the alkali is the effective agent, and ammonia would be more prompt in its agency.—*J. Murray.*

The Black or Negro Caterpillar.—All along the coast from Hythe to Folkstone, the Turnip saw-flies were congregated in myriads on the 14th inst., but they disappeared in a day or two with an easterly wind. I cannot find the Negro Caterpillars anywhere amongst the Turnips, which are all Swedes in this neighbourhood, and very healthy; but I discovered near Hythe a plant of Charlock, not 30 yards from a Turnip-field, covered with them. From these appearances the farmers may expect to be visited by these destructive insects next year, unless heavy rains and a severe winter should destroy them in their winter quarters.—*R. R., Sandgate.*

Twitchett's "Don John" v. Martin's "Splendid."—Being desirous in my contest with Mr. Martin to bring the comparative merits of my "Don John" and his "Splendid" to a satisfactory test, without wasting more words on the subject, the following is my ultimatum:—1st. To show not fewer than 21 blooms, as I proposed. If Mr. Martin's stock is scanty, he shall be at liberty to select blooms of his "Splendid" from every grower of the kingdom who possesses it. 2ndly. If the sum per bloom which I proposed be too high, I am content to reduce it to one-half; if too low, to double it. These are two simple and intelligible propositions; and if Mr. Martin be inclined to join issue upon them, no difficulty will be made in arranging the details.—*J. Twitchett, Cambridge.* ——Your correspondent "Dianthus" wishes to know "how it happened that Martin's Splendid was proved to be superior to Don John, by being placed first." I beg to state, for his information, that the being placed first is not always a proof of the superiority of a flower; and never was it more glaringly exemplified than in this case, as the bloom of Splendid was miserably deficient in colour, four only of the petals being equally bizarred; the remaining ones were nearly flakes, having just sufficient spots or specks to save the flower from being disqualified. There were many blooms of Don John exhibited at the same time far superior to Splendid in every requisite, viz., in possessing a more equal distribution of colour, clearness of white, size, &c.—*A Subscriber.*—[All further correspondence on this subject must be paid for as an advertisement.]

Early Potatoes.—It is no uncommon thing to plant early Potatoes at the bottom of a garden wall: and those planted in such a situation are generally a few days earlier than those in other parts of the garden. As it is the interest of the gardener to make the most of an early spot, the following method, although not new, which I have practised with early Potatoes, may perhaps be useful. Instead of planting a single row of the Ash-leaved Kidney Potato, as is commonly done, I plant a double one; the first close to the wall, and the next about a foot or 14 inches from that. Anything planted or sown close to a wall has a natural tendency to grow from it, and means are employed to attach them where the cultivator thinks proper. So it is also with the Potatoes put in near the wall: if left alone, they would soon grow over the second row; but, to prevent it, earthing and training the stem, similar to Love-apple plants, are resorted to, to prevent the back row from injuring the other. I think they ripen sooner, and a greater crop of Potatoes is obtained, than if there were only one row. One thing ought to be observed, to prevent the Potatoes that are near the wall from being injured: when moles get into a garden, they commonly have a public road along the side of the wall, and in the formation of it they sometimes cut the stems of the Potatoes—or if they are a little below the sets, the earth becomes hard and dry, and prevents the Potatoes from growing as they should do. This may be easily ascertained by pushing a pointed stick into the ground now and then.—*Peter Mackenzie.*

Beans, a preventive to the attack of the Gooseberry Caterpillar.—As Mr. W. P. Ayres has mentioned my name in conjunction with the curative qualities of Chamomile, I am induced to send you these lines in order to correct a slight mistake in his letter. Mr. Ayres states, that at the suggestion of a friend I had planted Chamomile at the roots of the Peach trees; whereas it should have been, that I saw it in the Irish Farmers' and Gardeners' Magazine—and although quite as sceptical on the subject (and still remain so) as either Mr. Ayres or Mr. Culthorp, knowing that often from trivial causes arise good effects, I was willing to give it a fair trial; and in proof of what I have stated, namely, that a simple remedy will often effect a cure, I may mention a circumstance that occured while I lived at Carton. For several years I had been much annoyed with the Gooseberry caterpillar; in fact, so much so, that the bushes were completely stripped of leaves. A person from the Highlands of Scotland chanced to call, who stated that he had an acquaintance who always planted common garden Beans amongst his bushes as a remedy. Being aware that if they did no good, they would do little harm, I consequently adopted the plan, and although I cannot explain by what means the cure is effected, I can confidently assert, that I have never seen the leaves of the bushes destroyed where Beans have been planted amongst them. Perhaps some of your correspondents may be able to explain this circumstance.—*A. Christie, Orwell Park.*

Effects of Daniell's Manure.—When I sowed my Cauliflower seed three or four weeks ago, I strewed over the surface of the bed a small quantity of Daniell's manure, thinking its smell might prevent the attack of the fly. Now that the plants are up, I observe that wherever the manure has fallen a little thicker than on other parts, the plants are scorched and curled, in fact destroyed; whilst on those parts where none fell, the plants are looking remarkably well and luxuriant. I have tried that composition in several instances, and invariably without any benefit.—*Lusor.*

To preserve Apples.—As the time is now drawing near when all diligent gardeners begin to gather and store away their Apples, I send you the method of treatment which I have practised with uninterrupted success for fourteen years; having during that period had the management of upwards of 400 bushels. I gather the different sorts in the order in which they ripen, and lay them in heaps in a loft or room to perspire for a fortnight. They are then wiped and put, two or three in thickness, on the shelves where they are to remain. The best Apple-room I ever had was at the Hon. G. King's; it was built under the shade of an old Oak-tree, and was fitted up with shelves 2½ feet above one another, and 3 feet wide. No light or air was admitted, except through the doorway; and it was perfectly dry. In this place, I have kept the Cockle Pippin until the month of June without shrivelling. One very essential thing in keeping Apples is, that in wet weather due attention be paid to picking out those which are rotten. Much fruit is saved by doing so; and it is necessary that Apples should have a general searching in order to be effectually cleared. Many instances have come beneath my notice, where persons whenever they visited their fruit-room have been content with picking out only such decayed ones as first presented themselves to sight; but the inutility of this practice is easily perceived, as many still remain to contaminate those adjoining.—*G. Fielder, Gardener, Wadhurst Castle.*

To preserve Plums.—The following is an account of the manner in which I preserve Plums: the same method might perhaps succeed with other fruit, but of that I am not equally certain. The Plums should be gathered as soon as they arrive at their full size; but before they are perfectly ripe, and immediately after they are gathered, wide-mouthed jars should be filled up to the neck with them. These jars should be placed in a copper or boiler, up to the neck in cold water, which should be made to boil until some of the Plums begin to assume a whitish colour; when this takes place, they should immediately be taken out, filled with boiling water, and instantly tied down with bladder. All this should be done in as short a time as possible. When required for use, the top Plums will be mouldy; but upon removing these the under ones will be found quite good. There should not be a spot, crack, or bruise, on one of the Plums intended for preserving, or the jar will be spoilt. No sugar is required in the preparation.—*Gulnare.*

Cape Bulbs.—I have seen, at different times, in the *Chronicle*, directions respecting bulbs from the Cape of Good Hope. Having resided in that country for some years, I took, and still retain, great interest in bulbs; but unfortunately not botanically. I have always several in my possession, but having neither pit nor greenhouse, I seldom get anything but leaves for my care. The reason why, on importation to this country, they seldom bloom after the first year is, that they require at a certain period (and which exact period I should like to know) a degree of heat sufficient to generate the embryo of the bloom for the following year. When gathered in their native country, that embryo is within the plant, if collected either in bloom, or, which is better, immediately after; but in nine cases out of ten, you would not be able to find them after the flower had faded. Some years ago, I saw one kind of Cape bulb, like the Belladonna (if not that), in full bloom in September, on a south-west border, at Shropham Hall, the seat of the Rev. G. Leathes, in Norfolk. Mr. L. told me they were planted with the crown of the bulb 18 inches below the surface, and the flower was then the same height above ground; and he said that no frost in this country could reach a plant at that depth. Last autumn, by way of experiment, I planted 12 bulbs in the open ground, viz., four at 18 inches, four at 12 inches, and four at six inches from the surface, close to a warm and sheltered south-west boarded fence. As yet they have not appeared above ground, but they ought within six weeks. Unfortunately my sandy soil here is not like that of Norfolk. Are you aware that sea-water is a great preservative of Cape bulbs? Some that I brought home were accidentally dropped, with the basket they were packed in, into Table Bay: and I do not think that one of those bulbs failed to grow. I have been in the habit of receiving, from a friend at the Cape, bulbs in return for vegetable seeds; and I used often to plant them in moss well washed in the sea. They grew freely, but weakly, the moss not affording sufficient nourishment. I received a packet in the early part of the winter of 1835, which had been two or three months in England before they reached me. I had a number of little baskets made, in each of which I planted a bulb well saturated with sea-water. I then had a larger basket made, of white wicker-work, in which I packed the smaller baskets, filling up the interstices on all sides with moss well soaked in sea-water, and crammed in as tightly as possible. I then covered the whole with matting, and left the package in charge of a tradesman, who stowed them away for me with other luggage. It was nearly two years before I saw that package again. All the larger bulbs were fresh and good; they were moist, and grew freely, being principally those which I have now in my possession, with a few of the smaller sorts. The loss of those that perished I do not attribute to the packing, as I had sent several away to different friends without salting, and they had failed likewise. I have frequently gathered the Candelabrum (Brunsvigia Josephinæ), as well as the Hæmanthus, within 20 yards of the sea at Simon's Bay, where they were covered with salt spray. I gathered the blue Babiana on the same day, in full bloom, growing in loose white sand, in hard ironstone clay, in wet, rich, boggy earth, and in common soil as well.—*R. G.*

Transplanting Evergreens.—Not a few papers have been written on the advantage of transplanting Evergreens in spring, as well as in autumn; but it is neither of those seasons to which I purpose to allude. I reside near London, in rather a high situation; and in hot weather the soil gets excessively dry. After such a statement as this, few people will be prepared to hear that not less than 200 Evergreens, (Yews, Hollies, Laurels, &c.,) varying in height from 3 to 8 feet, were transplanted in July of the present year, and are looking almost as healthy as if they had not been removed. Some of them had a good deal of earth attached to them, others had not; and no further precaution was adopted, previous to their removal, than what is generally resorted to on such work being done—that is, digging up the plants, watering the pits previous to the plants being set in, and afterwards with an occasional watering during the continuance of the hot weather. Such a circumstance as this, viewed in connexion with those I set out with, will be the surest way to arrive at the best time for transplanting Evergreens. With respect to spring-planting here, all I can say is, that success is but partial; for as sure as we have cold easterly winds in March and April, so sure are we that our planting will be attended with failure. The easterly wind blows cold upon us; the air gets heated from our more vertical position with the sun, and its capacity for moisture is increased; if the latter is not supplied from the earth by evaporation, the air abstracts the moisture from the leaves of the Evergreens, no roots are made, and the plants either die, or dwindle on a miserable existence.—*C.*

Absorption by the Root.—The following was the plan adopted by me, many years ago, in order to ascertain and trace throughout the system of the plant the substances absorbed by the root. To the distilled water in which the roots were growing, acetate of lead, or other soluble material, was added, and the plant being subsequently macerated in solution of iodide of potassium, or chromate of potassa, discovered by the yellow lines the direction of the substances absorbed. I mentioned my method to the late Mr. Capper, of Bath, who, I believe, adopted it in his researches on the circulation of sap in the Vine.—*J. Murray.*

FOREIGN CORRESPONDENCE.

Malacca.—I have got the female of Phytocrene; a beautiful and singular one it is. This genus, I fancy, will range near Menispérmeæ; and perhaps, as Arnott remarks, it may tend towards Urticáceæ. I have likewise just obtained a Menispermaceous plant which approaches in some points to Phytocrene, and which is another instance of the presence or prevalence in Assam of the forms of vegetation occurring in these straits. Except in want of ravines with torrents, of cliffs and caves, Malacca presents most of the rich features of a botanical country. We have marshy lands in which the Nepenthes abounds, Mangrove swamps, Rice lands, and sandy littoral tracts, as well as undulations covered with thickets or low jungle. Then there is the dense forest, which occupies so much of the interior, with a few islands, and river banks, although the latter are very limited in extent. The flora is certainly not rich in Ferns or Orchidáceæ, many of which are lost by their growing on the huge trees which characterise our forests. Gramíneæ are also scarce; but Scitamíneæ abound, as do also Asclepiadáceæ, especially Dischídia or Blume's Leptostemma.—*W. G.*

PROCEEDINGS OF SOCIETIES.

FLORICULTURAL SOCIETY.

Sept. 20.—The fifth and last exhibition was held at the Crown and Anchor Tavern, and was well attended, notwithstanding the unfavourable state of the weather. The prizes were confined entirely to DAHLIAS, of which there was an excellent display; and numerous stands were exhibited, independently of those to which premiums were awarded. Collections of 36 blooms were shown by Mr. Headland of Cambridge, Mr. Gaines of Battersea, and by Messrs. Brown and Attwell of Uxbridge. The latter was justly thrown aside, it having been discovered that the centre of one of the blooms had been removed, and a partially-expanded flower inserted in its place. A stand of 12 was also exhibited by Mr. Domyer. Messrs. Paul and Son, of Cheshunt, contributed two boxes of Roses, which were particularly good, although the late heavy rains have not been much in their favour. Prizes were awarded to the following:—PROFESSIONAL FLORISTS: 36 *blooms*—1. Catleugh's Eclipse, Bedford Surprise, Lady Cooper, Rienzi, Royal Standard, Penelope, Indispensable, Unique, Tournament, Hope, Nicholas Nickleby, Pickwick, Burnham Hero, Suffolk Phenomenon, Climax, Fanny Keynes, Maid of Bath, Suffolk Hero, Metella, Hylas, Optima, Beauty of the Plain, Lady Ann

Murray, Marquess of Lansdowne, Duchess of Richmond, Dodd's Prince of Wales, Widnall's Eclipse, Amato, Hudson's Princess Royal, Springfield Purple, Rival Sussex, Widnall's Queen, Andrew Hofer, Ne Plus Ultra, Lady Middleton, Mr. Brown, of Slough; 2, Mr. Widnall, of Cambridge; 3, Mr. Stewart, of Salthill; 4, Pamplin's Bloomsbury, Lady Cooper, Girling's Prince of Wales, Dodd's Prince of Wales, Burnham Hero, Girling's Ploughboy, Northern Beauty, Adam's Prince Albert, Nicholas Nickleby, Indispensable, Bedford Rival, Hylas, Sir T. B. Milne, Andrew Hofer, Widnall's Queen, Grace Darling, Hudson's Princess Royal, Winterton Rival, Unique, Regina, Bedford Surprise, Mr. Stanley, Bridal Ring, Andrew Marvel, Rienzi, Grande Baudine, Duchess of Richmond, Gipsy Maid, Catleugh's Eclipse, Coronation, Exquisite, Ward's Euclid, Maria, Springfield Rival, Mr. Girling, of Stowmarket. AMATEURS, GROWING 200 PLANTS AND UPWARDS: 24 *varieties*—1, Andrew Hofer, Lady Middleton, Pickwick, Marquess of Lansdowne, Maid of Bath, Yellow Defiance, Grand Tournament, Grace Darling, Springfield Rival, Duchess of Richmond, Bridesmaid, Grande Baudine, Burnham Hero, Widnall's Queen, Regina, Lady Cooper, Penelope, Bedford Surprise, Beauty of the Plain, Widnall's Eclipse, Argo, Hope, Indispensable, Catleugh's Eclipse, Mr. Bragg, of Slough; 2, Phenomenon, Springfield Rival, Miss Abbott, Amato, Maria, Pickwick, Yellow Defiance, President of the West, Prince of Wales, Andrew Hofer, Bridesmaid, Duchess of Richmond, Bedford Surprise, Catleugh's Eclipse, Lord Dudley Stuart, Ward's Euclid, Maid of Bath, Grace Darling, Optima, Constancy, Conservative, Argo, Metella, Mr. Cook, of Notting Hill; 3, Indispensable, Yellow Defiance, Catleugh's Tournament, Haidée, Duchess of Richmond, Pickwick, Miss Johnston, Hudson's Princess Royal, Andrew Hofer, Maria, Rival Sussex, Bridesmaid, Optima, Prince of Wales, Maid of Bath, Bedford Surprise, Regina, Burnham Hero, Unique, Ne Plus Ultra, Catleugh's Eclipse, Widnall's Queen, and Metella, Mr. Procter, of Bermondsey. AMATEURS, GROWING LESS THAN 200 PLANTS: 12 *varieties*—1, Catleugh's Eclipse, Maria, Ward's Euclid, Marchioness of Aylesbury, Miss Abbott, Argo, Will Watch, Attila, Rose Unique, Haidée, Orange Perfection, Cyclops, Mr. Wildman; 2, Prince of Wales, Hope, Rival Sussex, Satirist, Lewisham Rival, Catleugh's Eclipse, Unique, Springfield Rival, Phenomenon, Widnall's Queen, Princess Royal, Andrew Hofer, Mr. Headly, of Cambridge; 3, Grace Darling, Ne plus ultra, Penelope, Fanny Keynes, Countess of Pembroke, Sir J. Astley, Springfield Rival, Unique, Ansell's Queen, Maria, Nicholas Nickleby, Pickwick. CLASS SHOWING: *Best dark*, Essex Triumphant, Mr. Turville. *Scarlet*, Catleugh's Eclipse, Mr. Brown. *Edged*, Princess Royal, Mr. Brown. *Rose*, Widnall's Queen, Mr. Brown. *White*, Empress of the Whites, Mr. Smith, of Hornsey. *Yellow*, Dodd's Prince of Wales, Mr. Brown. SEEDLINGS OF 1842.—6 *blooms*. 1ST CLASS: *Essex Triumphant* (Turville.) This fine flower was noticed last week in our report of the Salthill show. It now occupied the post of honour, a situation it worthily filled; in addition to which, it was placed first in class-showing as the best dark flower. As a test of its constancy, 36 blooms were exhibited in the room, uniformly good. The general form of the flower is excellent, its size medium, with great depth of petals; the eye being perfect in all the specimens. To these fine properties we may add, that the petals are finely formed, of good substance, and well arranged. The colour is of the deepest rich maroon, and being very uniform throughout, gives great grandeur to the appearance of the flower. 2. *Virgil* (Mountjoy).—Deep crimson, a flower of considerable depth and fine general form, with the centre very good and well elevated. The petals are well formed, of good substance, and well arranged. 2D CLASS,—6 *blooms*—1, *Beauty of Sussex* (Mitchell.) The petals are well formed, of good substance and arrangement. The flower is attractive on account of its colour, having a deep edging of mottled cherry upon a delicate rose ground; it is a full-sized flower, of good general form, with the centre well up, but thin. 2. *Hero of Stonehenge* (Whale).—This is a crimson flower, of good general shape, with the centre elevated, but closely filled with upright petals. The latter are of good form and fair substance, but the arrangement is rather confused. 3. *Great Mogul* (Brown and Attwell.)—A full-sized flower, of a dull shaded red; the petals are good, but rather flat; the substance and arrangement are both good. The eye is a little sunk, and the flower rather flat. 4. *Empress of the Whites* (Smith, of Hornsey.)—The blooms of this flower were inferior to those exhibited at Salthill; the form and substance of the petals are good, but the arrangement is slightly confused; the white is good, and the flower is well formed, of a medium size. 5. *Sir R. Sale* (Smith, of Hackney), a compact and well-formed crimson flower, the eye being well up, with great depth of petals. SEEDLINGS OF 1842.—The following four received 2d-class prizes, viz.: 1, *Queen of the Roses* (Hale), a bright and desirable colour. 2. *Aurantia* (Sparry), a dull orange. 3. *Cheltenham Queen* (Hodges), white.—4. *Washington* (Smith), purple. The following *seedlings* were also exhibited, but did not receive prizes:—1841. Venus (Gaines); Beeswing (Brown); Aurantia, Orb, Sphere, Victor (Widnall); Twyford Rival (Headland); Bianca (Smith); Pet Rival (Bushell); Prime Minister (Lawrence); Venus (Brown and Attwell); Rotherham North Midland (Evans).—1842. Triumph, decided to be Unique (Tyler); Crimson Perfection (Parsons); Emma (Bushell); Criterion of Perfection (Tayler); Comte de Paris (Drain); Sir R. Chester (Steyne). In the evening a meeting took place, Mr. Wildman in the chair—when several of the successful exhibitors attended, and received the amount of their prizes. Mr. Bragg, of Slough, on receiving the prize of five guineas, offered by Mr. Wildman for the best white Dahlia, announced his intention of offering the same sum towards a sweepstakes for the best white Dahlia of 1841 or previous years, to be shown in 1843, at the following exhibitions:—The Floricultural Society, the South London, and Salt Hill. Mr. Smith of Hackney, and Mr. Smith of Hornsey, likewise gave two guineas and a half each, making the prize ten guineas; entries 2*s*. 6*d*. each to form a second prize. Six blooms of a seedling Dahlia of 1841, named *Mrs. Jas. Richardson*, was sent for opinion, by Mr. Edwards, of York; it is fair to state, that on the present occasion this flower was shown in much better character than it appeared at the South London exhibition last week; the bloom being quite up in the centre and decidedly first-rate. The following was the decision of the censors:—Form, substance, and arrangement of petals, good; eye good; depth full; size medium; general form good; colour white, occasionally tipped; class of quality first-rate.

COUNTRY SHOWS.

Royal Caledonian Horticultural Society, Sept. 1.—The display of plants and flowers on this occasion was not extensive, premiums being only offered for Carnations and Hollyhocks; but the specimens produced were remarkably good. For the best 12 CARNATIONS, *Flakes and Bizarres*, the highest prize was awarded to Mr. D. Foulis, gr. to Alex. Blair, Esq., being Ely's Col. Wainman, Mrs. Ely, Volunteer, Queen of Roses, Admiral Napier, Duke of Bedford, Fair Flora, Wilson's William the Fourth, Sir R. Wilson, Sir H. Davy, Fletcher's Duke of Devonshire, and Cartwright's Rainbow. A 2d prize was voted to Mr. P. Thomson, gr., Craigiehall, for a collection consisting of Hercules, Champion, Worcester Rival, Jacques' Queen of Roses, Mr. Granger, Birmingham Hero, Game Boy, Princess Charlotte, Duchess of Kent, Duke of Wellington, Fair Flora, and Sylvia. For the best 6 PICOTEES, the prize was again found due to Mr. Foulis, the varieties being Annalby's Lord Norbury, Ely's Grace Darling, Fletcher's Jane, Ely's Mrs. Horner, Fair Helen, and Princess Royal. The show of HOLLYHOCKS was rich; the highest prize was once more given to Mr. Foulis, and a second premium was assigned to Mr. Alex. Foulis, gr. to Sir P. C. H. Calderwood, Durham. Several articles were sent for exhibition only; in particular, four beautiful Seedling Dahlias, raised in 1841 by Mr. Thomson, at Craigiehall; and some fine Hollyhocks, and large specimens of Jargonelle Pears, from Mr. W. Lothian. Specimens of a Seedling Gooseberry, of good quality, and remarkable for lateness (a desirable property in a season like the present), were sent by Mr. Somerville, gr. at Kippenross.

Wingham Horticultural and Floral Society, Sept. 13*th*.—Although the weather was not actually wet, it was not sufficiently inviting to tempt so large an assemblage of company as we have usually seen at this Exhibition; nor was the display of flowers so good as we have been accustomed to see. The following prizes were awarded:—BEST 3 FU'CHSIAS—fulgens, Thompsoniana, grandiflora maxima, Mr. Sankey. *Single do.*—Standishii, D. Denne, Esq. PETU'NIAS—picta, Victoria, superba, Mr. Sankey. SÁLVIAS—patens, splendens, fulgens, Mr. Sankey. BALSAMS—D. Denne, Esq. COCKSCOMBS—Mrs. Gregory. ANNUALS—Martýnia probóscida, Didíscus cærúleus, Phlox Drummondi, Mr. Sankey. PERENNIALS—Linária dalmática, Lychnis Bungeana, Hemerocallis japónica, Mr. Sankey. BEST CLIMBING PLANT—Mrs. Gregory. BEST BULB—Guernsey Lily, Mr. Dadds. BEST 3 GREENHOUSE PLANTS—Leschenáultia formosa, Melaleuca floribunda, Correa Harrísii, J. P. Plumptre, Esq., M.P. *Best Single do.*—Róchea falcata, Mrs. Dowker. BEST STOVE-PLANT—Euphórbia splendens, Mrs. Gregory. DAHLIAS, *best* 6—Lewisham Rival, Prince of Wales, Admirable, Pickwick, Lord Dudley Stuart, Beauty of the Plain, Rev. J. G. Hodgson; 2, Widnall's Queen, Egyptian Prince, President of the West, Maria, Hope, Argo, Rev. C. Baylay. *Best Yellow*—Prince of Wales, Rev. J. G. Hodgson; *Purple*—Pickwick, Rev. C. Baylay; *Crimson*—Wheeler's Maria, Capt. Swann; *Rose*—Widnall's Queen, Rev. C. Baylay; *Maroon or Dark*—Egyptian Prince, Rev. C. Baylay; *Scarlet*—Lee's Bloomsbury, Capt. Swann; *Lilac*—Lady Middleton, Mr. Sankey; *White*—Lewisham Rival, Mr. G. Denne; *Orange or Buff*—Pamplin's Bloomsbury, Rev. C. Baylay; *Edged or Tipped*—Phenomenon, Rev. C. Baylay. *Best Dahlia of any colour*—Admirable, Rev. J. G. Hodgson; *Seedling*—Mr. G. Denne. AFRICAN MARIGOLDS—Mr. D. Deverson. FRENCH MARIGOLDS—do. ASTERS—do.; 2, Mr. T. Quested. ZI'NNIAS—1 and 2, Rev. C. Baylay. ANNUALS—Lupinus mutábilis, L. élegans, Malva Zebrina, Agératum mexicanum, French Marigold, Zínnia élegans, coccínea, Clárkia alba, Golden Chrysánthemum, Phlox Drummondi, Erýsimum Perofskyanum, Sweet Pea, Tropæolum peregrinum, Rev. C. Baylay; 2, Mr. Sankey. BEST 12 PERENNIALS—Phlox tardiflora, Pentstemon campanulatus, P. gentianoides, P. róseum, Crucianella stylosa, Tritónia, Linária dalmática, Lobélia fulgens, Chrysocoma lynosyris, Gaillárdia bícolor, Sálvia patens, Stachys speciosa, Mr. Sankey. STOCKS—Mr. J. Dadds. FLORAL DEVICE—Mr. W. Branford. BOUQUET OF TENDER FLOWERS—J. Godfrey, Esq. BOUQUET OF HARDY FLOWERS—J. P. Plumptre, Esq. MELON, *Green-flesh*—Sir B. W. Bridges, Bart; (*netted Green*) Lady Montresor. GRAPES, *Purple, from the open air*, Black Cluster, Mr. Cooper; *White*, Sweetwater, Mr. J. Elgar; *Best Purple, grown with fire-heat* (St. Peter), J. P. Plumptre, Esq. M.P.; *White do.* (Muscat of Alexandria), Sir B. W. Bridges, Bart.; *Best Purple, grown under glass without fire* (Black Hamburgh), J. P. Plumptre, Esq., M.P.; *White do.* (White Nice), J. Godfrey, Esq. BEST COLLECTION OF GRAPES—Frontignan, Black Frontignan, Sweetwater, Hampton Court, Claret, White Nice, Black Hamburgh, White Muscadine, J. Godfrey, Esq. FIGS—(White Ischia), Rev. T. A. Mutlow. PEACHES—(Red Chancellor), Mr. Cozens; 2 (Red Magdalen), J. Godfrey, Esq. NECTARINES—(Elruge), J. Godfrey, Esq.; 2 (Roman), Mr. Cozens. PLUMS GROWN AGAINST A WALL—(Coe's Golden Drop), Rev. E. Gregory; *do., not grown against a wall* (Coe's Golden Drop), Mr. H. Branford; 2 (Diadem), Mr. J. Elgar. CHERRIES—(Morello), Mr. Cozens. BEST EIGHT PEARS, *grown against a wall*—(Williams's Bon Chrétien) Mr. J. Elgar; 2 (Seckle), Mr. J. Elgar. *Do. not grown against a wall*—(Williams's Bon Chrétien), Mr. Dadds; 2, Mr. Fostall. BEST EIGHT VARIETIES—(Brown Beurrée, Marie Louise, Williams's Bon Chrétien, Seckle, Winter Jargonelle, Capiaumont, D'Aremberg, unknown), Mr. J. Elgar. APPLES—*Dessert*, Summer Nonpareil, Mr. G. Knight; 2, Golden Pippin, D. Denne, Esq.; *Kitchen*, Hawthornden, Mr. D. Deverson; 2, Fair Maid of Wishford, Rev. E. Gregory; *Best Twelve sorts* (Irish Pitcher, Beauty of Kent, Keswick Codlin, Tokers's Incomparable, Ribston Pippin, Dutch Codlin, Scarlet Admirable, Kentish Fillbasket, White Lion, Emperor Alexander, Woodstock Pippin, and Fair Maid of Wishford,) Mr. J. Elgar. FILBERTS—D. Denne, Esq. COB NUTS—Mr. Harrison. WALNUTS—Mr. D. Deverson. CURRANTS—*White*, Mr. Harrison; *Red*, Mrs. Hudson. BEST BASKET OF FRUIT—Mr. J. Elgar. PEAS—Knight's Marrow, Mr. G. Denne. ONIONS—Rev. J. A. Wright. CELERY—Mr. D. Deverson. CARROTS—Rev. J. A. Wright. BROCCOLI—Mr. D. Deverson. CABBAGE—ditto. LETTUCE—ditto. POTATOES—*Kidney* (Sheep's-tail), ditto; 2, (Church's Kidney), Rev. J. M. Sayer; *Round* (Cockney), Lady Montresor; 2, Rev. J. M. Sayer. CUCUMBERS—(White-spine), Mr. Fostall. BASKET OF VEGETABLES—D. Denne, Esq. Numerous prizes were also distributed to Cottagers for their garden produce.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

EPIDENDRUM LANCIFÓLIUM. Lance-leaved Epidendrum. (*Stove Epiphyte.*) Orchidáceæ, § Epidéndreæ. Gynándria Monándria.—This plant, which has so much the habit of E. cochleatum, is readily known by its regularly ovate sharp-pointed lip, which is streaked with deep purple radiating lines upon a pale yellow ground. Any one who can grow the old Epidendrum cochleatum, or fragrans, can easily manage this with similar treatment. It should be kept in a cool stove along with other plants of like habits, many of which have been lately imported from the high land of Mexico and Guatemala. It grows well amongst brown turfy peat in a pot which is well drained, and may be watered and syringed freely during its period of growth, and should at no time be kept too dry.—*Bot. Reg.*

ILLI'CIUM RELIGIOSUM. Sacred Aniseed Tree. (*Greenhouse Shrub.*) Magnoliáceæ. Polyándria Polygýnia.—A young plant of this interesting species was presented by Mr. Makoy, of Liege, to the Royal Botanic Gardens at Kew; and in the greenhouse there, it flowered in great perfection in the month of March. By the Japanese this plant is held sacred; they strew wreaths and branches of it over the tombs of their friends, and their priests burn the bark as a perfume upon the altars of their deities. A singular use is made of the pulverised bark by the public watchmen: hollow tubes, graduated on the outside, are filled with this substance, which is lighted at one extremity, and burns gradually and uniformly; so that when the fire has reached a certain mark, the watchmen strike the hour upon a bell, and thus announce it to the public. The trunk is stated sometimes to attain the height of a Cherry-tree; the stems and branches are rounded and glabrous. The flowers, which are greenish yellow, and destitute of fragrance, proceed from the axils of the leaves, and are for the most part solitary.—*Curtis's Bot. Mag.*

PHARBITIS OSTRINA. Royal Purple Gaybine. (*Climbing Perennial.*) Convolvuláceæ. Pentándria Monogýnia.—This is a very beautiful climber, and was obtained last year by Messrs. Loddiges from Cuba. The roots are large and tuberous; the stem perishing every winter, but growing out rapidly in the spring to the length of twenty feet or more, and producing abundance of blossoms. It is of the easiest culture, and should be grown in a mixture of good sandy loam and leaf-mould, to which may be added a small portion of sandy peat if the loam is strong. It requires plenty of room for the tops, and should be freely supplied with moisture, both overhead and to the roots, during the growing season; but when the plant has done flowering, moisture should be gradually withheld, until the soil in the pots becomes dry. Then the roots should be removed from the soil, and be placed either in paper or in very dry sand, for a month or two. As the season returns, they must be again potted; receiving little water at first, but plenty of heat to start them. They are easily increased from cuttings of the young shoots.—*Bot. Reg.*

PLANT'S ANISANTH. Garden variety. (*Greenhouse Bulbous plant.*) Iridáceæ. Triándria Monogýnia.—This beautiful plant is a mule obtained by Mr. Plant, nurseryman, Cheadle, and is the produce of seed from Anisanthus splendens and Gladiolus Colvillii. It is a greenhouse bulb, and requires the same treatment as Antholyzas, Cape Gladioli, or Ixias. It thrives best when potted in a mixture of sandy loam, leaf-mould, and a little peat. The roots should be potted about October, and set in a cool close frame (where they are secure from mice and frost), till they have filled the pots with roots; afterwards they should be removed to a warmer situation to flower. After they have done flowering, they should be gradually rested by withholding water, and finally the roots should be removed from the soil; which is much better and safer than to allow them to remain in the pots, for they always start with greater strength the next season.—*Bot. Reg.*

DENDRO'BIUM SANGUINOLENTUM. Scarlet-spotted Dendróbium. (*Stove Epiphyte.*) Orchidáceæ. Gynándria Monándria—This is a plant from Ceylon, of great beauty, with pendulous stems like those of D. Pierardi, but of a delicate purple when young: the leaves too are stained underneath and at the edges with the same colour. The flowers are as large as those of D. aggregatum, of a clear fawn colour, with the tips of the segments and lip stained with a deep rich violet. There is, moreover, a scarlet spot in the middle of the lip. Of this fine plant there is a variety without the violet spots, and with somewhat larger flowers. Both kinds have recently flowered at Syon.—*Bot. Reg.*

ONCI'DIUM BARBATUM. Bearded Oncídium. *Stove Epiphyte.*) Orchidáceæ. Gynándria Monándria.—This very pretty and long-lost species has again appeared in the Glasgow garden, where it had been sent from Pernambuco. It has a graceful, panicled habit, and a curious bearded bright yellow lip, the side lobes of which are large and yellow, while the middle lobe is obsolete, fringed and spotted with crimson. It must be a very rare plant, for Professor Gardner never met with it during his long botanical journeys in Brazil.—*Bot. Reg.*

DRYMO'NIA PUNCTATA. Spotted Drymónia. (*Stove Creeper.*) Besleriáceæ. Didynámia Angiospérmia.—This curious plant has the habit of a Sinningia with a creeping stem, and was introduced from Guatemala by Mr. Hartweg. It has light green leaves with a crimson midrib, and the petiole stained with the same tint. The flowers are of a pale cream colour, dotted and spotted with violet. The lobes of the corolla are deeply fringed, and give the plant a pretty appearance; but its want of bright colour will prevent its being a favourite with cultivators. It has blossomed in a stove in the garden of the Horticultural Society.—*Bot. Reg.*

VANILLA PALMARUM. The Palm-tree Vanilla. (*Stove Epiphyte.*) Orchidáceæ. Gynándria Monándria.—This plant has now flowered, for the first time in Europe, in the collection of Messrs. Loddiges. The blossoms are pale green, of a delicate texture, and about two inches long. The lip is hairy at the base, has an elevated broad line in the middle, and one on each side where it touches the column. At the summit of the ovary is a narrow calycle, obscurely three-lobed, and of a fleshy texture. It is one of the few Orchidaceous plants which inhabit Palm-trees.—*Bot. Reg.*

STELIS ARGENTATA. Silver-studded Stelis. (*Stove Epiphyte.*) Orchidáceæ. Gynándria Monándria.—This plant is a native of Guayana, and has lately flowered with Messrs. Loddiges. The flowers are on long racemes, dull greenish purple, slightly hairy, and rather large for this genus; the petals are purple, and, as well as the labellum, have their truncated extremities covered with an appearance like minute particles of silver. It forms large tufts, and flowers very abundantly.—*Bot. Reg.*

E'RIA PA'NNEA. Cloth-like Eria. (*Stove Epiphyte.*) Orchidáceæ. Gynándria Monándria.—An Orchidaceous plant from Sincapore, with narrow dagger-shaped leaves of a pale yellowish-green, and a single greenish-yellow flower, woolly on the outside, and seated on a short scape covered with a whitish cloth-like substance. The labellum is purplish, slightly hairy, and has a broad patch of a mealy hairiness a little below its point.—*Bot. Reg.*

MISCELLANEOUS.

New American Plum.—About two years since, our attention was called to a new Plum, of superior quality, which originated in the city of Hudson. The original tree, of large size, is standing in the garden of Mr. Lawrence, in that city, and was raised from a seed of the Greengage. Although the Columbia Plum is celebrated in the neighbourhood where the original tree grows, it is as yet scarcely at all known to cultivators or nurserymen; and we (Downing, of the Newburgh nursery) are now endeavouring to propagate it largely. The tree is a most abundant bearer, and the fruit, when fully ripe, is of a beautiful colour and delicious flavour. The following are the characteristics of the variety:—Form almost globular; diameter of the fruit nearly two inches. Stem about an inch long, rather slender, inserted in a slight cavity; suture scarcely visible, on one side of which the fruit is rather larger than on the other. Colour brownish purple, or dark brown covered with purple bloom, dotted with numerous golden specks. Flesh adheres slightly to the stone, which is small, and considerably compressed. Skin thin; juice abundant, rich, and sugary; young shoots and leaves slightly downy; the leaves not glossy on the upper surface. The soil of Hudson and the vicinity is a stiff, heavy loam, in many places running into clay, which produces large and abundant crops of Plums. Indeed, on the North River, all our most productive orchards of this fruit are upon heavy clay soil. The Plum orchard of Mr. Denniston, of Albany, one of the largest in this country, is planted in a retentive clayey soil, and the trees bend under the heavy weight of their purple and golden fruit, when in other orchards, planted on light sandy soils, scarcely a fruit reaches maturity. We have therefore frequently recommended, with excellent success, the application of clayey loam as a manure for this tree on light sandy soils. It increases the retentiveness of the soil, and the roots are furnished with a more abundant supply of moisture and nutritive matter.—*Hovey's Magazine.*

Gardener's and Farmer's Foreign Library.—Hlubek, F. X., Ernährung. The Nourishment of Plants, and the Staticks of Agriculture. Prag, 8vo, with thirteen tables.——André, E. A., Züchtung. The Breeding of the fine-wooled Sheep. Prag, 8vo.——Weinar, S. Krenstwiesenbau. The Culture of Artificial Meadows. Prag, 8vo.

African Indigo.—Mr. Ansell, Gardener and Collector to the Niger Expedition, reports that he has just ascertained that the plant so extensively used by the natives for dyeing their cloths of the beautiful blue colour for which they are so remarkable, is not a species of Indigo, but of the genus Tephrosia, and near to the Tephrósia toxicária, and that it grows in great abundance in the neighbourhood of the Confluence.—*Friend of Africa.*—[It is as well to add that the Nubian Indigo is also a species of Tephrósia, and apparently T. Appollínea, as was ascertained by Mr. Hoskins when in that country.]

THE NATURALIST'S CORNER.—No. II.

(Continued from page 624.)

6. Respectable mariners have related that they have seen on the coast of Normandy, bees arriving across the water from the islands of Jersey and Guernsey, situated at a distance of more than fifteen miles. The bees come from these islands to plunder the flowers, and return to the hives laden with booty.—*St. Pierre.*

7. The Laplanders, possessing a country where Corn will not grow, make bread of the inner bark of trees; and Linnæus reports that swine there fatten on that food as well as in Sweden upon Corn.—*Lord Kames.*

8. Animals that walk appear to have no general likeness in the form of their bodies to those that creep, and still less to those that fly; yet in all of them, however differently the bones are fashioned to adapt them to these various uses, the skeleton consists of a skull and four extremities which have correspondence in their bones; so that although the parts are fitted for uses not at all similar, they are all links of the same chain. The bones of the fin of the seal, which is formed for swimming, and those of the bat, which is made for flying, resemble the human hand, which has so different an office.—*Sir Everard Home.*

9. The more we contemplate the works of nature, and observe the means she employs in her ordinary operations, the more will our admiration be excited. In the hands of nature nothing is lost:—vapours raised from the sea, and floating in the upper regions of the air, collect into clouds; these, on a reduction of temperature, yield their contents to the thirsty earth; the waters, after fulfilling their appointed office, pass from the mountains by a thousand rills into the plains; here, by their junction, they form rivers, which taking a circuitous course, empty themselves into the ocean. Hence we see nature engaged in running a perpetual round, and the waters, after cooling the atmosphere and refreshing the earth, return to that source whence they originally sprung: and thus is beautifully illustrated a passage in Holy Scripture (Isaiah, ch. 55, verses 10, 11), that not a drop of rain shall return unto Him void, but shall accomplish the purposes for which it was sent.

10. Dr. Paley, in his "Natural Theology," introduces the autumn Crocus, *Cólchicum autumnale*, as a striking instance of the compensatory system. "I have," says he, "pitied this poor plant a thousand times. Its blossom rises out of the ground in the most forlorn condition possible, without a sheath, a fence, a calyx, or even a leaf to protect it; and that not in the spring, not to be visited by summer suns, but under all the disadvantages of the declining year. When we come, however, to look more closely into the structure of this plant, we find that nature has gone out of her course to provide for its security, and to make up to it for all its defects. The seed-vessel, which in other plants is situated within the cup of the flower, or just beneath it, in this plant lies under ground, within the bulb. The tube of the flower extends down to the root. The germ grows up in the spring, upon a footstalk, accompanied with leaves; the seeds have thus the benefit of the summer, and are sown upon the surface. The order of vegetation externally is this:—the plant produces its flowers in September, its leaves and fruits in the spring following."

(To be continued.)

GARDEN MEMORANDA.

Horticultural Society's Garden, Turnham Green.—Great alterations are in progress in the house generally known as the curvilinear stove. Originally, it was separated by a back wall from another smaller house, chiefly used as a dry stove for the cultivation of Mammilláriæ, Melocacti, &c.; this wall being now removed, and two light iron pillars being substituted in its stead, the house is converted into a spacious span-roofed edifice, and its appearance thereby greatly improved. All the rain which falls upon it will be collected in two slate tanks, manufactured by Mr. Beck, of Isleworth; the water from the front being conducted into a reservoir beneath the floor, while that from the back will be conveyed into another, situated in the pit, which occupies the centre of the house. Another and much larger slate tank, for the growth of Aquatics, will fill one end of the building. The water in this will be heated by means of a small pipe, which proceeds from the boiler, and after dipping into the aquarium, passes back by the return pipe. On each side of the house, adjoining the glass, are small borders intended for the growth of climbing plants. The building is to be heated by two of Shewen's boilers, of different sizes; the second, or smaller one, being only requisite in cases of extreme cold. These boilers are a great improvement upon the conical ones, originally invented by Mr. Rogers. In the latter, the fuel is supplied at the top, from whence also the smoke makes its escape, and with it a great portion of the heat. This defect is remedied in the boilers constructed by Mr. Shewen; in these the top is arched over, and the cavity which contains the water extends *above* the fire as well as around it; the fuel is admitted on one side of the boiler, and an iron pipe or chimney carries away the smoke on the opposite side; so that by this means, a great saving of heat is effected. The flow pipe also, instead of issuing from the side of the boiler, rises from the summit, which adds greatly to the circulating power of the water. The pipes are four inches in diameter, and have open gutters, about a foot wide, cast upon them; the water for evaporation being thus brought into immediate contact with the heated pipe; whereas, when the trough is affixed to it in the usual manner, there must necessarily be a slight space existing between the two, however closely fitted, as well as a double thickness of material, which cannot but diminish the force of evaporation. Amongst the Orchidaceous plants we observed in bloom the pretty Brasavola venosa, its large white labellum traversed in all directions with numerous veins, and the green strap-shaped divisions of its perianth rendering it a conspicuous object; Cœlógyne Cummingi, a new and handsome species, with flowers of the purest white, and having the labellum strongly marked with yellow, interspersed with a few brown spots: Oncídium pergameneum, yellow mottled with brown, resembling On. reflexum in the general appearance of the flowers, but differing from it in the great width of the leaves; a new variety of Gongora, sent over by Hartweg, with beautiful pale yellow blossoms densely spotted with purple, the colour of the lip almost approaching to orange; the highly-prized Odontoglossum grande, with several fine species of Cattleya, the singular Cypripédium venustum, and a pale variety of Catasetum maculatum. The greenhouse is gay with the several species of Achimenes, amongst which the new one, A. pedunculata, chiefly attracted our attention. In the flowers, which are borne in great profusion upon long peduncles, it bears more resemblance to a Gesnera than to an Achimenes; these are of a brilliant scarlet on the outside; the throat is yellow, with three distinct lines of dark red spots diverging from the centre through each division of the corolla. A. rósea and the well-known A. coccínea are also flowering freely; the former is a pretty variety, with deep rose-coloured flowers, the mouth of the tube being yellow, and marked faintly with red. Last, but not least, the noble A. grandiflora, now pretty generally known, the same plants of which have continued to flower uninterruptedly for several months. Nearly allied to these is a handsome new plant, called Niphæa oblonga, with numerous white flowers, having the mouth of the tube filled with a bundle of yellow stamens. In the stove, Gesnera mollis, a strong-growing variety, is producing whorls of innumerable scarlet blossoms; the mouth of the corolla is studded with glands, each tipped with a viscid secretion resembling minute drops of dew. With it is a pretty hybrid Ipomœa, raised by Messrs. Lee, not very distinct from I. Horsfálliæ in the foliage, but considerably lighter in the colour of the flowers. The plants in the conservatory are looking well; it is in spring, however, that this house presents the gayest appearance, when the great number of Leguminous plants wich it contains are in bloom. The most striking one at present flowering in this extensive division is Kennédya splendens, a handsome scarlet climber. The sweet-scented Mandevilla is also expanding its numerous clusters of chaste white; with the showy Hedýchium Gardnerianum, whose stems are each terminated by a spike of rich yellow flowers, with prominent scarlet pistils. Amongst the new plants in bloom in the hardy department, are Convólvulus longifólia, from Hartweg, the corolla of which is white, and tinged with purple in the centre, and Cuscuta milensis, with white flowers and orange-coloured stems, from the Berlin Botanic Garden. Bérberis tenuifólia is also flowering for the first time; the racemes are very long and slender, and are produced five or six in a cluster. In the pits we noticed Roscóea purpúrea, a Scitamineous plant, generally cultivated in the stove, but here found to be nearly hardy. The late warm summer has brought most of the autumn Pears into use earlier than usual. The Flemish Beauty is a delicious melting kind, and requires to be gathered before it separates readily from the tree; otherwise it loses this valuable property. The Fondante d'Automne is also an excellent melting Pear. Drapiez d'Eté is good, and bears considerable resemblance to the Doyenné kinds in appearance and in texture of the flesh. The Dunmore is a fine melting fruit, and deserves the character given to it at p. 671 of last year's *Chronicle*. The samples of Beurré Diel, from standards are uncommonly handsome and free from cracks; many of this kind from the wall-trees measure upwards of 12 inches in circumference. The Wormsley Pippin is found to be an excellent Apple, and an abundant bearer; the flesh is firm, and highly flavoured; its size is too large for dessert, but its quality as a stewing Apple is first-rate.—*R. A., Sept.* 19.

CALENDAR OF OPERATIONS *for the ensuing week.*

If the finest gardens in the kingdom are closely inspected, the analysis will show that one important item of their beauty consists in handsome specimens of trees and shrubs. To obtain these, whether as single plants or in groups of mixed species,—in which every individual ought to be allowed room to assume, in some degree at least, its natural character,—timely thinning is essential. We too often see trees and shrubs, upon the purchase and planting of which considerable sums have been lavished, suffered to ruin themselves irremediably, through tardiness in bringing into use those indispensable auxiliaries—the axe and the saw. This is not the proper season for pruning and thinning; but, as suggested at p. 604, the necessity for, and the effect of, any alteration, can be much better appreciated now than after the leaves have fallen. In garden scenery, where every member of a tree comes more distinctly under notice than in the distant landscape, the shade of colour, form, and other peculiarities of leaves, are necessary to be considered, in forming pleasing combinations, as well as the general outline of the tree: all these minute points ought therefore to be studied now, and unsuitable trees or branches marked for removal in winter. So, likewise, when the planting of conspicuous places with a view to ornament is contemplated, the particular kind of trees which, singly or in masses, would have the best effect in each particular situation, should be ascertained by observation and comparison while they wear their summer dress.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—Where suckers and crowns have been struck on a dung hotbed, some of them may have filled their pots with roots, and will consequently require to be sorted out and repotted; afterwards they may be set in the houses or pits, where they can have more room to grow. A brisk bottom-heat must be applied to the crowns and suckers which have not yet formed roots, taking great care that they do not suffer from too much moisture. If there is much drip in the frame, raise it at the back to give the lights a greater pitch. Where leaves are not used to supply bottom-heat, a sufficient quantity of fresh bark should be got ready for the renewal of the beds against winter. The pits should now be regularly covered at night, observing to let the plants have light early in the morning.

Vinery.—Whenever the atmosphere is foggy and damp, fire should be made in those houses containing ripe Grapes, not for the purpose of warming but of drying the interior air. It will be better, therefore, to set the fires on every damp day, at the same time giving plenty of air, when that can be done without letting wet into the house. Many berries will be found damaged by wasps and flies, and these should be cut out whenever they are observed, lest by rotting on the branches they contaminate others.

Peach-house.—Before wet weather sets in, the sashes should be put upon the house intended for early forcing; afterwards the trees may be pruned, dressed with the composition formerly described, and tied to the trellis, at the first convenient opportunity.

Fig-house.—Unless there happens to be ripe fruit of the second crop yet remaining upon the trees, the foliage should frequently be washed with the engine, to remove, if possible, every trace of red-spider. Trees in pots should be prepared for early forcing, by shifting, if that process is required, or by top-dressing with rich soil.

Cucumbers and Melons.—Fire-heat should be applied to late Melons in wet and dull weather, to assist the swelling of the fruit, and prevent canker. In fine days give air liberally to these and to growing or bearing Cucumber plants, shutting them up warm and covering the pits at night. Stop the main shoots of the plants intended for winter fruiting, that a sufficient number of laterals may be obtained to cover the trellis.

Out-door Department.

Artichokes.—These in all likelihood will throw up heads in abundance now, having in many places been prevented by drought from producing the usual crop earlier in the season; a good stock might therefore be obtained to dry for "bottoms," which make an useful dish in winter when green vegetables are scarce.

Broccoli.—If the transplanting is concluded, the standing plants should be cleared of dead and broken leaves, and earthed up till they stand firmly enough to resist strong winds.

Cauliflowers.—Continue to prick out the largest plants till a sufficient number are obtained for the earliest spring crop.

Carrots should be taken up, dressed, and stored away in a dry shed. When left too long in the ground, they often throw out innumerable fibres, to the great detriment of the roots.

Endive.—The plants from the last sowing will now be large enough for transplanting at the foot of some of the walls, where they are not likely to be disturbed by the removal of the wall-trees.

Mustard and Cress should be sown under glass after this time, as a supply cannot be depended upon from the open ground.

Onions.—Hoe among the young plants, and continue to dry and house those from the last spring sowing.

Potatoes.—Take these up as soon the haulm begins to wither; in some soils they are much injured by grubs at this time of the year.

Orchard.—Persevere in gathering fruit as it ripens, which will be somewhat earlier this year than usual, owing to the greater warmth of the summer. In doing this, recollect that the well-keeping of Apples and Pears depends materially upon careful gathering and storing. Reject all that are grub-eaten or otherwise damaged, for if such are taken into the fruit-room they will cause much unnecessary trouble by-and-by in sorting, &c. Dress Strawberry plantations before winter, by cutting off the runners and weeding among the plants. New plantations of Gooseberries and Currants may be made now.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Keep the house much drier than formerly, so that the shoots and leaves which have been formed during the summer may be hardened and able to resist the dull and damp winter months. In the Orchidaceous house, shade may gradually be dispensed with; a little air can be given when the sun is bright, and this with a drier atmosphere will prevent the young pseudo-bulbs or flower-stems from damping, which they are now apt to do.

Greenhouse and Conservatory.—Plants which have been taken into the houses should have all the air possible, leaving the sashes open all night in fine weather. Be regular in watering, by which the necessity for a great quantity at one time will be avoided. Judicious watering is a great point in the successful management of pot-plants, which can hardly be expected to thrive in soil that nearly approaches mud at one time, and dust at another. Pelargoniums, which have been headed down and repotted some time, will perhaps require to be shifted again. If fine plants are wanted, they must not be crowded.

Pits and Frames.—The plants in these should now be arranged, so far as practicable, to make room for the wintering of those which are to be taken up from the flower-garden. In doing this, take care to place soft-wooded plants where they will be least liable to suffer from damp. Forward Cinerarias, intended for early blooming, should be repotted and taken to the greenhouse, placing them near the glass, and where they will get a great deal of air. Chinese Primroses, to flower early, must also be encouraged. Thin young Mignonette in pots, and be moderate in watering it.

Out-door Department.

In case it has not yet been done, lose no time in collecting all the ingredients necessary to form composts for florist's and other flowers. Examine dried bulbs and tubers occasionally, and plant very small offsets of choice Tulips, as these often shrivel and die when kept too long out of the ground. Various species of Fungi now spring up about the lawns, especially in places where at some former period trees have grown. These should be constantly picked up, for however interesting they may be when closely examined, they do not by any means contribute to the beauty of the lawn. New Dahlias for next season ought to be selected while in bloom. This is as necessary when border-flowers only are wanted, as it is in procuring expensive varieties for prize-showing; because many, of which the blossoms individually are beautiful, are, from their habit of hiding the flowers among the leaves, not at all showy plants.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Besides the work mentioned last week, seeds of all kinds of trees and shrubs which are now ripe should be collected and laid up for sowing in spring.

Forest and Coppice Woods.—See last Calendar.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending Sept. 22, 1842, as observed at the Horticultural Garden, Chiswick.

Sept.	Barometer.		Thermometer.			Wind.	Rain.

REPORT ON COVENT GARDEN MARKET,

For the week ending Sept. 23, 1842.

The supplies of Fruit still continue to be unusually large, and trade in this department is very dull. *Fruit.*—Amongst the Pines are some handsome Providences and Queens, from 3*s.* to 5*s.* per lb. We observed some unusually fine Black Hamburgh Grapes, from 2*s.* 6*d.* to 3*s.* 6*d.* per lb. Muscats are from 2*s.* to 4*s.* per lb. English Melons have advanced a little in price, being from 1*s.* 6*d.* to 4*s.* each. Nectarines are no longer to be obtained; but Peaches are not scarce, from 3*s.* to 9*s.* per doz. The dessert Plums consist of Coe's Golden Drop and the Imperatrice, which are selling at 1*s.* per punnet. Damsons are uncommonly cheap, and may be had at 2*s.* 6*d.* per bushel. Figs have risen to 1*s.* 6*d.* and 3*s.* per doz. Of Apples there is a good assortment, at an unusually low price: the best are the Yellow Ingestre and Ribston Pippin, at 4*s.* per bushel; the Downton and Wyken Pippins, at 3*s.*; the Kerry Pippin, at 5*s.*, and the Alexander, at 2*s.* 6*d.*, per bushel. The principal Pears are the Gansell's Bergamot, Marie Louise, and Brown Beurrée; the former from 6*s.* to 10*s.*, the latter from 2*s.* to 4*s.* per half-sieve. Walnuts are plentiful, from 4*s.* to 6*s.* per bushel. Filberts fetch from 60*s.* to 80*s.* per 100 lbs. A few Berberries are offered, at 3*s.* 6*d.* per half-sieve. *Vegetables.*—The price of most kinds remains nearly the same as given in our last report. Brussels Sprouts have made their appearance, at 2*s.* per half-sieve; they are, however, small at present. French Beans are becoming less plentiful, and fetch from 2*s.* to 3*s.* per half-sieve. Red Celery is very good, and is selling from 1s. 6d. to 1s. 9d. per bunch; the White is not so firm, and fetches from 9d. to 1s. per bunch. Field Mushrooms are abundant, at 3s. 6d. and 4s per bushel. Tomatoes are also plentiful, and sell from 2s. to 2s. 6d. per half-sieve. *Flowers.*—The display of cut flowers has lately been remarkably good, consisting of Gloriosa superba, Stephanotis floribundus, Amaryllis Belladonna, Gardénia radicans, and a variety of Caméllias, Ericas, Cinerárias, &c.

PRICES, Saturday, Sept. 24, 1842.—FRUITS:—

Pine Apple, per lb. 3s to 5s
Grapes, per pound, 1s to 3s 6d
— Muscats, per pound, 3s to 4s
— Spanish, 1s to 1s 6d
— Portugal 1s to 2s
Melons, English, each, 1s to 4s
— Dutch, 6d to 1s 6d
Peaches, per doz. 3s to 9s
Figs, per doz., 1s 6d to 3s
Plums, dessert, per punnet, 1s
Damsons, per hf. sieve, 1s to 3s
Apples, dessert, per bush., 3s to 5s
— Kitchen, 2s 6d to 5s
Pears, dessert, per hf.-sieve, 1s to 5s
Berberries, per hf.-sieve, 3s 6d

Mulberries, per gallon, 9d to 10d
Cucumbers, per doz., 1s to 3s
Oranges, per doz., 1s to 2s
— per 100, 5s to 20s
Lemons, per doz. 1s 3d to 3s
— per 100, 9s to 20s
Almonds, per peck, 7s
Sweet Almonds, per pound, 3s
Filberts, English, per 100 lbs. 55s to 70s
Walnuts, Shelled, per bush., 16s to 24s
— Green, 3s to 4s
Nuts, per bushel—
— Brazil, 20s
— Barcelona, 24s
— Cob, per 100 lbs., 60s to 65s

VEGETABLES.

Cabbage, per doz. 1s to 1s 3d
— plants, per doz. 1s 6d to 2s
— Red, for pickling, 1s 6d to 2s 6d
Brussels Sprouts, per hf.-sv. 2s
Broccoli, per bunch, 9d to 1s
Cauliflowers, per doz., 4s to 6s
Beans, Kidney, per hf. sv., 2s to 3s
— Scarlet, per hf.-sv. 1s 6d to 1s 9d
Potatoes, per ton, 40s to 70s
— per cwt. 2s to 3s 6d
— per bushel, 1s 6d to 2s 6d
— Kidney, per bu., 2s to 2s 6d
Jerusalem Artichokes, per half-sieve, 2s 6d to 3s
Turnips, per doz. bun., 1s 6d to 3s 6d
Carrots, per doz. bun., 4s
Red Beet, per dozen, 6d to 1s
Parsneps, per bunch, 6d
Horse Radish, per bundle, 2s to 5s
Radish, per doz. hands (24 to 30 each) 9d to 1s
— Turnip, p. doz. bch., 9d to 1s
Spinach, per sieve, 1s 6d to 1s 9d

Leeks, per doz. bun., 1s 9d to 2s
Shallots, per lb., 8d to 1s
Onions, per doz. bch., 5s
— Green, p. doz. bun. 3s to 4s
— Spanish, per doz. 1s 6d to 5s
— for Pickl., per hf.-sv. 2s to 3s 6d
Garlic, per lb. 4d to 6d
Lettuce, Cabbage, p. sc., 1s to 1s 3d
— Cos, 1s to 1s 6d
Endive, per score, 1s 3d to 1s 9d
Celery, per bd., (12 to 15), 9d to 2s
Small Salads, per punnet, 2d to 3d
Watercress, per doz. sm. bun. 4d to 6d
Parsley, per doz. bun., 2s
Tarragon, per doz. bun., 2s to 3s
Mint, per doz. bunches, 2s
Basil, per doz. bunches, 2s to 4s
Vegetable Marrow, per doz., 6d to 8d
Tomatoes, per hf. sv. 1s 6d to 2s 6d
Capsicums, green, per 100, 9d to 1s 3d
— Ripe, 3s 6d to 4s
Mushrooms, Field, per bus., 3s 6d to 4s

Notices to Correspondents.

J. S.—Apply at once, through your newsman, for the back Numbers you want, or you will not be able to have them, as we are nearly out of print.

A Young Lady.—Ipomœa rubro-cæru'lea is a perennial climber, and requires the temperature of a stove. The exact proportion of Alum which should be applied to Hydrángeas to change the colour of the flowers has not yet been ascertained; but experiments upon this subject are in the course of trial at the Horticultural Society's Garden, the result of which will shortly be made known. The consequence of allowing Pelargóniums to grow year after year without pruning will be, that the plants will become unsightly, as the lower part of the stems will become entirely destitute of leaves. We would advise you to cut them down immediately. We never heard of Soot being adulterated. Lime is sometimes mixed with Bone-dust: in order to ascertain whether the latter is genuine or not, sprinkle a little strong vinegar over it, and if any effervescence takes place, you may be sure that it is adulterated with lime.—‡

A Reader.—The only work with which we are acquainted that treats upon the cultivation and preparation of Coffee, is Porter's Tropical Agriculturist. A separate work by the same author is devoted to the culture of the Sugar Cane.—‡

H. Rd.'s Beetle is so mutilated from not being enclosed in a quill or pill-box, that it is impossible to speak with certainty as to the species. We imagine from its economy that it is the Hylurgus piniperda, against the ravages of which we know no remedy.—*R.*

Dinanais is referred to the Amateur's Garden of last week.—*

Ynys.—We have written to Mr. Frost, the gardener at Dropmore, respecting the best method of increasing Arauca'ria imbricata, who informs us, that he has succeeded in striking them readily from cuttings with a gentle bottom-heat. At the same time he is of opinion that when handsome plants can be obtained at the nurseries for five shillings each, it is not worth while to cut a plant to pieces to make cuttings of it; moreover, that the latter are many years before they form a leading shoot, and that consequently much time is lost in rearing a promising specimen.—‡

John Shand.—The following is a list of Fruit-trees suitable for an Orchard:—Dessert Apples—Early Red Margaret, Early Harvest, Kerry Pippin, Wormsley Pippin, Oslin, Golden Reinette, King of the Pippins, Pitmaston Nonpareil, Claygate Pearmain, Blenheim Pippin, Hughes's Golden Pippin, Court of Wick, Pearson's Plate, Ribston Pippin, Margil, Maclean's Favourite, Reinette du Canada, Adams's Pearmain, Herefordshire Pearmain, Golden Harvey, Braddick's Nonpareil, Boston Russet, Court-pendu Plat, Old Nonpareil, Scarlet Nonpareil, Sturmer Pippin. Kitchen Apples—Hawthornden, Keswick Codlin, Tower of Glamis, Alfriston, Royal Russet, Bedfordshire Foundling, Northern Greening. Pears.—Citron des Carmes, Dunmore, Franc-réal d'E'té, Flemish Beauty, Aston Town, Fondante d'Automne, Marie Louise, Beurré Bosc, Louise Bonne (of Jersey), Althorp Crassane, Hacon's Incomparable, Thompson's, Winter Nelis, Winter Crassane, Glout Morçeau, Passe Colmar, Knight's Monarch, Ne plus Meuris, Easter Beurré, and Beurré Rance. For Stewing—Berzi d'Heri, and Catillac. Cherries—Mayduke, Knight's Early Black, Elton, Royal Duke, Bigarreau, Kentish, Florence, Morello, Büttner's October Morello. Plums—Royale Hâtive, Nectarine, Washington, Greengage, Purplegage, Kirke's White Magnum Bonum, Coe's Golden Drop, Ickworth Imperatrice, Shropshire Damson. The Siberian and Tartarian Crabs will answer for preserving; the Cherry Crab bears very abundantly, and the fruit of Biggs's Everlasting Crab hangs very late on the tree. We cannot name one nurseryman in preference to another; the above trees may be obtained of any respectable firm.—‖

Flora.—There is no reason to fear that your Lawn will be worn out by having the grass swept up with a besom. If there are any bare places in it, they have been probably caused by the excessive heat of the summer. A little seed scattered over such vacancies will soon restore their verdure.—‡

Malus.—Your Apples are—No. 2, Hollandbury; 3, Belle Harvey, 4, Beauty of Kent; 5, Passe Pomme d'Automne; 6, Pomme de Neige; 8, Old Pomme Roy; 10, Kerry Pippin; 11, Borovitsky; 12, Norfolk Beaufin; 13, Keswick Codlin; 14, Crimson Queening. The large Pear so highly coloured on the sunny side is the Vicar of Winkfield, the Monsieur le Curé of the French. It has sometimes been grown to an enormous size.—‖

D. D.—It is too late in the season to attempt to strike cuttings of the Ghent and American Aza'leas. They will not strike in the open ground, but must be potted in silver sand, and covered with a bell-glass, placing them afterwards either in a cool part of the greenhouse or in a frame where they can be shaded during the heat of the day. This operation should be done as early in the season as growing shoots can be obtained.—‡

Tyro.—Your plant is one of the varieties of the Marvel of Peru.—†

J. C. L.—The specimen sent is Catasètum discolor, with green flowers. A good plan of packing cuttings is to tie some damp moss round the lower parts of them, and after surrounding the whole with paper, to secure them in a small hamper, with moss well moistened.—‡

Warwickshire.—If your Guernsey Lily is planted out of doors, you must take great care to protect it from the frost. When the leaves are destroyed before they have decayed naturally, the bulb also perishes. You had better spread some dead leaves or litter over the border as soon as there is any appearance of frost, or you might take up the bulb and pot it in dry soil; it might then be kept in the greenhouse, or in a room out of the reach of frost. After Ixias and Oxalises have flowered, water should be entirely withheld, and the pots kept in a cool and dry part of the greenhouse. In the early part of November they should be potted into a mixture of peat and silver sand, with a trifling addition of loam; they must be regularly supplied with water when they begin to grow, otherwise the foliage of the Ixias will soon assume a yellow appearance.—‡

Worcester.—Ropiness in cider is caused by the growth of one of those curious plants which botanists call Mycoderms. It does not appear to us that the cause of ropiness is understood; by some it is alleged that the acidity of fluids brings it about; but on the other hand it appears in fluids that are perfectly free from *all* acidity. In wine it is referred by Chaptal to a deficiency of sugar, and he says that it is gluten, half-decomposed, and imperfectly dissolved in wine, which produces ropiness. What is true of wine will probably be true of cider, but M. Chaptal's statement seems to us to throw very little light upon the subject. A case is mentioned by Parmentier, where half a vat of Champagne, drawn off the March after the vintage, all became ropy, while the remainder, bottled in the following September, remained clear and unaffected. The preventions are, 1, to dissolve sugar in the must, when it is too weak and watery; 2, not to deprive the Grapes of their stalks; 3, to let the fermentation be completed in the casks, and then to draw off the wine into a sulphured cask, fining it thoroughly before bottling. If the wine becomes ropy notwithstanding, Chaptal directs it to be treated thus. Take four pints of good wine, boil it, and dissolve in it 8 to 12 ounces of cream of tartar and as much sugar. When these substances are dissolved, the mixture is sufficient for mixing with 150 bottles of ropy wine. The whole is poured into a cask and well bunged down. Then an air-hole is bored in the side of the cask and stopped with a spike. That done, the cask is rolled about for five or six minutes, and then placed on its stand with the bung downwards. If there is reason to fear that the cask will burst, the air-hole is opened for a moment and then replaced. After standing two days, the liquor is fined in the usual way, and again bunged down closely. In four or five days the wine is clear, and may be drawn off, but this must be done very carefully in order to avoid disturbing the lees.—†

M. C.—Your Pears are—No. 1, Crassane; 2, St. Germain; 3, Williams's Bon Chrétien; and 4, Old Colmar.—‖

J. Smith.—The dark Pansy, No. 1, is good in colour and texture, but too small; 2, is also good in colour, with good substance of petal, but the form is not first-rate; the upper petals are too elevated, and those at the side rather small; 3, a fine yellow, with a distinct and well-marked eye; it has the same fault as 1, in being undersized.—*

A. M.—Your plant is the Verbena officinalis.—†

A. E.—The climbing Cucurbitaceous plant which is found upon the West Indian mountains, and called there the Chow Chow, is probably the Momórdica Balsámina. The seeds of the crimson Cánna from Madeira will not be of use to us. No. 3 is the white-flowering variety of Clitória Ternátea. The division between the genera Convólvulus and Ipomœa is founded upon structural peculiarities, different from those which formed the basis of the Linnean distinction.—†

Broughton.—One of your plants is Catasetum laminatum; the other is a variety of Gongora maculata. The single flower is Catasetum integérrimum.—†

W.—The Rose is probably R. alpina; the other plant seems a bad specimen of Galega officinalis; but the specimens are so small, that it is impossible to say with confidence.—†

B. B. B.—We will look for the papers and return them. Perianth properly signifies the envelope of a flower which consists of calyx and corolla so alike as to be undistinguishable by colour and form, as in a Crocus. It is rarely used in the present day, and is, in fact, an unnecessary term.—†

We have received from the publishers a copy of "*The Act for the Relief of Insolvent Debtors; with Notes, Observations, and an Index*"—which will be found very useful to those who happen to be so unfortunate as to have occasion to study it.—†

T. S. P.—We regret to say we are ourselves annoyed by rats (water-rats) without being able to discover any remedy for the evil. Professor Henslow's plan for destroying wasps, in an article in another part of our *Chronicle* to-day, might perhaps prove useful. It is extremely difficult to name correctly some kinds of plants, unless very good specimens are supplied; from what you now state, we presume you have the Láthyrus tuberosus. If so, the tubers are eatable; they are named in some gardening books "Dutch Mice." Blue vitriol will produce no effect; you should employ green vitriol; but bleaching powder is much more effectual in destroying the smell of drains, and will do no harm. Climbing Roses *will* make long straggling shoots; there is no help for it.—†

J. G.—No. 1 is Fearn's Pippin; the seedling, No. 2, is too green at present for us to form any correct estimate of its merit.—‖

Rus.—The best thing you can do with the ground intended for Cauliflowers is to trench it well two spits deep, throwing into the bottom of the trench any refuse vegetable matter which may be at hand, and burying a small quantity of manure beneath the top spit. Trenching land is not so much attended to as it deserves to be; a portion of every garden should be so treated yearly. Where such has been the case, we have never known Cauliflowers to fail.—‡

J. R.—Send a Post-office order for 6s. 6d. and it will be handed to our agent, who will execute your order.

O. P.—Send the numbers to the office and they will pay you what you ask.

O. P.—Of your plants, No. 1 is Zannichéllia palustris; 2 and 3, Senécio vulgaris; 4, Mentha arvensis.—‡

J. B.—Your Nut is the Spanish.—‖

H. H.—Your specimen is certainly Rosa cinnamómea.—†

Oliver Twist.—The plant is Heimia salicifólia.—†

X. Y. Z.—You have done right in cutting down Fuchsia corymbiflo'ra, if it had become straggling. You may winter your Heaths in a cold frame, provided you can protect them from the frost, and keep the interior free from damp. A free circulation of air must be allowed them on all favourable occasions. You have been misinformed; there is no such thing as a blue Rose.—‡

S. S. S.—Your Pears are—No. 65, 83, Easter Beurré; 70, a deformed specimen; 71, Colmar; 80, St. Germain; 82, Beurré Diel; 84, Passe Colmar; 78, unknown.—‖

W. B. B.—We fear your Honduras Cactus is not distinct from Céreus látifrons of the Botanical Magazine.—†

Galnaor.—Can you not guess the meanings of the marks?—†

Clericus.—Your specimen having no flowers, we can only say it is some Acanthaceous plant. The moss is Hypnum and not Sphagnum, and is unfit for the cultivation of Orchidaceous plants. Sphagnum grows only in bogs, and is white and spongy. It is of no consequence whether the stems of Lilium lancifólium are cut down or not when they are dead; but as they are then unsightly, they are better removed.—†

Hardwick's Cratægus is C. coccinea, of which there are several slight varieties; this seems to be the common form, with few or no spines, and very smooth bark.—¶

M. C.—The Solanum is S. pinnatifidum; the other plant is Anagyris indica.—†

A. G.—The new edition of the Horticultural Society's Fruit Catalogue, which is now in the press, will give a description of all the principal fruit-trees now in cultivation.—‡

T. S. P.'s fly is not a Hornet, but Tabanus bovinus; the most essential difference between these insects is, that the former has four, the latter only two wings. The specimen transmitted to us is a male, which sex inhabits flowers; the females, however, will *bite* horses and cattle very severely, but cannot *sting*.—*R.*

W. W. E.'s flies have died of a disease which is common to dipterous insects, especially the *Muscidæ*, in the autumn. Sometimes they may be seen sticking to the glass of a window in the same manner, and are generally surrounded by minute whitish particles, as if the body of the animal had burst with violence, and scattered its contents all round. We believe the subject has been discussed in Kirby and Spence's Int. to Entom.—*R.*—They are surrounded by parasitical fungi.—†

G. W.—Judging from the leaves you have sent, neither the one nor the other belongs to Vanda Roxbúrghii, but it is not in our power to tell you what they may be; you must wait patiently until they flower. You have been keeping your Epidendrum cinnabarinum too warm. The Indian Dendróbia like a warm house, and that is the reason yours do so well; but D. speciosum will not do well amongst them: the advice given to your friend was therefore bad, and of course both of you failed. You had better pursue the same treatment, with regard to D. speciosum, which you formerly adopted—viz., to winter it in a temperature of 65° by day, and not exceeding 55° by night. Copper wire will injure the roots of the plants; we have not observed the effects you describe, which are rather curious. We will attend to your suggestion in the forthcoming papers upon the management of these plants.—§

W. M.—When the Orchidaceous plants which you have named have finished their season's growth, they ought to be kept nearly, but not quite, dry for the winter. Combretum also requires less water during the winter months. Lílium speciosum and its varieties should be kept perfectly dry after the stems have died off. They are nearly hardy, and will do very well in a cold frame, if you do not allow them to suffer from damp.—§

Y. Y.—The Hops which you have sent, and which were grown within 500 yards of the wash of the sea, on the most eastern point of the coast, where the soil consists of little else but sand, are very fine.—†

A Novice.—The Pear is the Marie Louise, and is fit to gather.—‖

Mr. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3d. each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5s. for every 25 copies.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

The French papers are actively engaged in discussing the new treaty between this country and the United States. They all agree in regarding it as a virtual concession of the right of search on the part of Great Britain, and contend that France can no longer consider herself bound by any conventions on a subject whose principle has been rejected by an inferior naval power. They declare that the American Government has been treated with greater deference than their own, and demand an immediate share in the concessions exacted by the United States. The republican papers suggest that the American Cabinet might have obtained even more advantageous terms in the present embarassments of England, and express their hope that the affairs left unsettled by the treaty may yet lead to a rupture.—From Spain we have fresh rumours of a modification of the Cabinet, but no change is expected until the opening of the Cortes on the 1st November. Disturbances have again occurred in some parts of the provinces, but they seem to have been of a local character and unconnected with political objects. A special Ambassador has left Madrid for Belgium and Holland; the purpose of his mission is the subject of much speculation, and public opinion is divided between the negotiation of a marriage between Queen Isabella and a Prince of the House of Coburg, and proposals for a modification of the tariff.—From Portugal there is little news beyond the contemplated prorogation of the Cortes, and the passing of the Budget for the present year. The Tariff Question has made no progress, and nothing new has transpired on the subject.—From Germany we learn that the King of Hanover has recovered from his recent illness, and returned to his own capital. The accounts from Cologne continue to be filled with details of the festivities in honour of the King of Prussia, who seems to have completely won the affections of his subjects in the Rhenish provinces. Letters from Hungary inform us that the liberal policy recently introduced into the Diet is still making extraordinary progress: in the ensuing Session the nobles are resolved to abolish capital punishment, to adopt the principle of publicity in criminal proceedings, and to abolish their own privileges by admitting the burgher class to a participation in the election of their magistrates. The influence of this example could not long be confined to Hungary; and we accordingly find, by advices from Transylvania, that the Diet of that nation has granted to every man an equal right to participate in the general affairs of the country, and has given the peasants power to possess and dispose of property of any kind.—From Turkey we have intelligence of a change of Ministry; the Grand Vizier has been deposed by the Sultan, on the score of incapacity; and the diplomatic body, who have long regarded him as the chief obstacle to any settlement in Syria, now look forward with certainty to a speedy arrangement of the affairs of the Lebanon. A new insurrection has broken out in Servia, and Prince Michael has been compelled to seek safety in flight; the restoration of his father, Prince Milosch, is considered to be the chief object of the movement.—From the Cape of Good Hope we have official accounts of the successful relief of Capt. Smith and his handful of troops at Port Natal. The Commander of the relief force speaks in the highest terms of the gallantry of this little party, who maintained their position for a month under circumstances of no ordinary privation, reduced to horseflesh for food, and hemmed in by a desperate and active foe. The new commander executed his task with great skill; the rebellious Boers made a vigorous attempt to oppose his landing, but were at length driven from their positions, and our troops took possession of the territory with scarcely any loss.

At home, the completion of the most abundant harvest within the memory of man has suggested the propriety of a general thanksgiving; the Ministerial papers state that the proposal is under the consideration of Government, and that there is little doubt of its adoption. The manufacturing districts were again disturbed in the beginning of the week, but the hands have returned to work in Stockport and other places, and there are good reasons for believing that the strike will soon terminate from deficiency of funds.

Home News.

COURT.—The Queen and Prince Albert arrived at Windsor Castle about noon on Saturday, on their return from Scotland. Her Majesty and the Prince, with the Prince of Wales and the Princess Royal, continue in excellent health.—His Imperial Highness the Archduke Frederick Ferdinand of Austria arrived at the Castle on Wednesday, on a visit to the Queen, accompanied by Baron Lebzeltern, Count Caroly, and Prince Esterhazy.—On Thursday the Queen Dowager, attended by the Earl and Countess of Denbigh, arrived at the Castle from Bushy Park, on a visit to Her Majesty.—The Duke of Cambridge has left Woburn Abbey, where his Royal Highness had been staying on a visit to the Duke and Duchess of Bedford, to honour Lord Ravensworth with a visit at Ravensworth Castle.—The Countess of Mount-Edgecumbe has succeeded the Duchess of Norfolk as the lady-in-waiting on the Queen; and Mr. Ormsby Gore has succeeded Capt. Meynell as the groom-in-waiting on Her Majesty.

Arrival of Lord Ashburton.—The Warspite, 50, Captain Lord John Hay, arrived at Spithead on Friday afternoon, bringing home Lord Ashburton, from his mission to the United States. His Lordship left the Warspite between two and three o'clock, and landed at Gosport, the ship saluting him when he left her, and the batteries upon his landing. The Warspite has been seventeen days from America, having left on the morning of the 5th inst. She was becalmed two days, or would have made the run in fifteen days. Lord Ashburton, upon landing at Gosport, immediately proceeded to his residence at Anglesey.

Foreign.

FRANCE.—*The Journals.*—The Paris papers are chiefly occupied in discussing the treaty concluded between England and the United States. In the opinion of the Republican *National*, the latter, although the treaty was highly honourable, and conformable to their interest, had not derived all the advantages they might have expected from the embarrassed position of Great Britain, which was betrayed by her excessive anxiety to arrive at the conclusion of peace. It blames the American Government for not demanding full satisfaction for the destruction of the Caroline, and flatters itself with the hope that the affair of the Creole, which was left unsettled, may yet lead to a rupture. The *Courrier Français* states that the Government of the Union had, by that treaty, given a new consecration to the grand principle of the inviolability of the flag, and "that it was impossible to suppose that, in presence of such a compact, either Cabinet could long submit to the humiliation of the right of search, and the protocol should still be left open, in order that France might adhere to the deplorable treaty of 1841." The *Commerce*, after presenting its readers with a gloomy picture of our situation, and bestowing a few words of praise on the activity of our statesmen, their devotion to their country and its interests, expresses indignation at the United States "being allowed the honour of showing to the world how the pretensions of England can be resisted." "Is not France," it exclaims, "as great and as powerful as the American republic? Does she occupy less space and hold an inferior rank among nations? and yet, since the revolution of July, we have been at the mercy and placed under the control of England. We have submitted to the right of visitation, which the Americans have rejected once more; we have even to a certain extent voluntarily undergone that humiliation, after a public insult, after the signature and execution of the treaty of the 15th July. What is the cause of this difference between the two countries? It is simply this—the American Cabinet depends for support on its own citizens against foreigners, whilst the French Cabinet stands in need of foreign aid to make head against the interior." The *Journal des Débats* expresses its opinion, founded on the notes exchanged between the British Plenipotentiary and the American Secretary of State, "that the question of the right of visitation, which, owing to the nature of the relations existing between the two countries, is inseparable from the question of neutrals, is more removed than ever from a satisfactory solution. The United States not only have not obtained any satisfaction on the most irritating point of their relations with Great Britain, but the English Plenipotentiary even refused, in a categorical manner, to enter into any arrangement on a question which, it is true, can only present itself in time of war, but which always leaves the door open for a rupture." The *Presse* declares that France can no longer tolerate the right of visitations exercised, even in virtue of the conventions of 1831 and 1833, nor suffer that the United States, who occupy a rank inferior to that of France as a naval power, should be treated with greater deference. "In the interest of peace, as well as of our national dignity," it says, "the principle of the conventions of 1831 and 1833 must be abrogated. We have a right to claim our share of the concessions made to the United States. If it should not be spontaneously conceded, we must take it ourselves. Thus it is incumbent on us, whenever the British Admiralty shall demand warrants for its officers, to deny them peremptorily, and to withdraw successively those that have been already issued. We have no other line of policy to pursue." In addition to this question, the journals have another subject for discussion in the gum trade, which, on all hands, is admitted to be expiring, and the colony of Senegal indebted little short of a million sterling. This is the trade which England is accused of seeking to disturb by the right of search.

The Post-office.—The *Courrier Français* announces, that Lord Lowther has visited Paris for the purpose of making new arrangements for the conveyance of the Indian mail, which is no longer to proceed through France after the expiration of the convention signed by the Post-offices of the two countries. "The mails," it says, "will hereafter be landed at Venice or Trieste. This will be highly prejudicial to our country, and by no means advantageous to the English; but although the distance be longer by that road than through France, their correspondence will follow it in preference, in order to avoid the delays and vexations of every description which their couriers have experienced in France. Such is the result of the impediments opposed to commercial and political relations by a narrow-minded and vexatious Administration." On the other hand, *Galignani's Messenger* announces, that M. Dubost, one of the heads of the French Post-office, has left Paris for London. "This gentleman," it says, "is charged by the Government to negotiate a new Post-office treaty on a much larger and more liberal basis than the existing one. The arrangements contemplated in M. Dubost's mission extend also, we understand, to the more rapid transmission of the Indian mail from Marseilles, and to the putting an end to the vexatious delays and difficulties which the couriers of the London press have hitherto experienced in carrying their despatches through France." M. Dubost is said to have always opposed in the Council the system pursued by the Administration with regard to the expresses of the London papers, and denied its legal right to prevent their free circulation through France.

The Capital.—The Prince de Joinville left Neuilly on the 14th for the Palace of the Tuileries, and set out in the evening for the Château d'Eu, to take leave of his family, previously to his embarkation in the Belle Poule frigate. The *Commerce* states, on the authority of a letter from the Château d'Eu, that Marshal Soult would be shortly appointed Governor of the Invalids, and that General Dode de la Brunerie, the director of the fortifications of Paris, would succeed the Marshal in the War Department. It also states that the French Government had at last resolved on granting, at the request of M. Piscatory, the million of francs demanded by the Greek Cabinet.—M. Jalley, the sculptor, has been entrusted with the execution of the marble statue of the late Duke of Orleans, voted by the Chamber of Peers. This artist is already favourably known by his statues of Louis XI. and Francis I., at Versailles; of Bailly and Mirabeau, in the Chamber of Deputies; of Marshals Lobau and Gerard, at present in his studio, but intended for Versailles; and by the beautiful statues of Prayer and Modesty, in the Museum of the Luxembourg.—The cause of Baron de Bode, which has been so long before the Courts, is now decided. The Baron having emigrated to Russia during the French revolution, his property was confiscated. Napoleon offered to restore it to his sons, the proprietor having died in his exile, but on condition that they should return to the service of France. They refused. After the fall of Napoleon, the eldest son, who resided in England, claimed an indemnity from France, as a subject of Great Britain. At last, after a period of twenty-six years, he has obtained his demand, and out of the 130 millions paid by France to England as an indemnity, he has obtained 20. During this space of time the members of this family, now possessed of immense riches, have had to suffer the most painful privations.—The library of the late M. Sismondi, author of the History of the Italian Republics, which is so particularly rich in historical works, is bequeathed to Professor Rossi, of Paris, after the death of Madame Sismondi.—The celebrated violinist, Baillot, died a few days ago in Paris, and was interred on Sunday last in the cemetery of Montmartre. The funeral was attended by most of the members of the Académie Royale de Musique, and by several distinguished literary and scientific men.—The papers speak in terms of praise of an invention of Colonel de Villiers, director of the artillery of Mons, for securing gunpowder from accidents in removal and storeage. This system possesses several advantages over that at present in use:—1, complete security in removal, even through fire, as the case will pass through a mass of lighted straw for 90 feet without any danger of explosion; 2, the case will take up a fifth less space; 3, it will hold 100lb. of powder, or 3,000 ball-cartridges, which can thus be more easily removed; 4, it will preserve powder safe and dry in the very worst stores; and 5, although the price of this case is greater than that commonly in use, yet the difference will be soon defrayed by the sums saved in repairs.

The Provinces.—Some of the votes of the French Council-General of Departments have just been published. The departments on the borders of Switzerland complain that their iron-foundries have greatly suffered this year. They attribute this to the introduction of English iron by the Rhine, the duty having been reduced on the eastern frontier from 66 fr. to 44 fr. per 1,000 kilogrammes—the treaty with Holland, and the progress of steam navigation on the river, having also much facilitated the means of transport. The council of the Doubs demand the re-establishment of the old duty of 1836 on the frontier of the east.—A singular instance of the mode of appeal in French criminal trials has just occurred, and may be received as a striking contrast to our own law in regard to the freedom of a culprit from being tried twice for the same crime. A man called Langlois was tried at Rouen for having suborned a person to fire at his father, who was wounded in the shoulder. He had also attempted to poison his parent. The jury admitted attenuating circumstances, and Langlois was accordingly condemned to the galleys for life. The Procureur-Général appealed against the sentence as too mild, and Langlois was tried again at Evreux. He was here condemed capitally, and executed at Forges on the 14th, in the presence of 3000 persons.—A manuscript of the 16th century has been found at Limoges, in which is detailed the ancient mode of enamel painting. It is to be sent to the manufactory at Sèvres, and great hopes are entertained of its also giving some valuable hints on the old manner of painting on glass.—The scientific world is much interested by the meteorological observations collected by M. Platow de Tchichatcheff, a young Russian officer, in an ascent he has just accomplished to the top of Nethon, the culminating summit of La Maladetta, the highest point of the Pyrenees.

The Navy.—The Toulon papers mention that the Ville de Marseilles, ship-of-the-line, which is to convey Baron de Langsdorf, the French Minister Plenipotentiary, to Rio Janeiro, is likewise to assist at the feasts which are to be celebrated there on the occasion of the marriage of the Emperor Pedro II. with a Princess of the Royal Family of Naples. Another ship of the line, in which it was believed that Admiral Casey would hoist his flag, was likewise to proceed to the Brazils from Brest. The papers add that the Belle Poule frigate, under the command of the Prince de Joinville, would also leave for that destination. One of the sisters of the Emperor, who is said to be affianced to the Prince, is to take passage in Admiral Casey's ship, and their marriage will be celebrated on their arrival in Paris.

Algeria.—A telegraphic despatch announces that General Bugeaud has set off for Oran in great haste, on learning that Abd-el-Kader was once more in force, and on the field, and that he had attacked General Lamoricière near Mascara. The Governor-General is about to despatch another expedition against the Emir. The papers hint that the Arab tribes, in their late summer submission, were merely flinging dust in the eyes of the Governor-General in order to save their harvests. General Bugeaud has published a manifesto on the state of Algeria, in which he suggests that it should be made a Military colony, and declares there is no keeping it, even during peace, with less than 80,000 men.

SPAIN.—The Madrid papers of the 12th have been received. Rumours continued to be current respecting a modification of the Cabinet, but they were somewhat discredited in consequence of the report that the Minister of Finance had at last succeeded in obtaining an advance of funds, so as to enable him to satisfy in some measure the claimants of the State. Should there be any change of Ministry it is not expected to take place before the opening of the Cortes on the 1st Nov. Some disturbances had occurred at Cordova, in consequence of the municipality refusing to confirm the election of certain officers in the National Guard of that place. The Ayuntamiento declared that the election was illegal, and therefore invalid; whereupon the National Guard threatened to put every member of that body to death. Ultimately the municipality was forced to yield; nor did the political chief deem it necessary to interfere in the affair. Sixteen out of twenty-three town councillors have tendered their resignation. An inquiry is to be instituted by order of the Government. Señor Arguelles, the Queen's guardian, and Count Ofalia, are stated to be seriously ill. Señor Olozaga left Madrid on the 10th for Belgium and Holland, taking Paris on the way. The object of his mission is said to be a negotiation with those Governments for a modification of the tariffs, with the view of giving extension to the commerce of Spain. Some papers, however, assert, that the object of the mission is not only to negotiate a treaty of commerce with Holland, but has reference to the marriage of Queen Isabella, who, according to this journal, is to have a Coburg for a husband. It is said in other quarters that the Government, desirous of restoring its navy, has authorised him to propose an exchange of a certain number of Dutch ships for an adequate quantity of timber from the forests of Spain.—The funeral obsequies of Lope de Vega, the Spanish poet, have been celebrated with a magnificence unparalleled in the history of literature. The grandees and other lords of Spain marched at the head of the procession. The ceremonies lasted 9 days, and were heightened in their effect by the music of the Chapel Royal and the pomp of public worship. On each of these days a different Bishop officiated, and in the funeral orations pronounced over his tomb, exalted no less the purity of his life than his surpassing talents.—By advices from Valencia we learn that that part of the country had been visited by dreadful hurricanes, which had caused considerable damage and loss of property. At Alcira and Cariagente the hail fell in torrents, and it is stated that some hailstones were picked up weighing *eight pounds!* The Regent has ordered an inquiry to be instituted in order that assistance may be rendered to the victims of Alcira, which is called the garden of Spain. It is computed that the damage and loss of property exceed eight millions of reals.—A duel at Cadiz between the political chief of the city and the editor of the *Globe* paper has excited much interest both at Cadiz and Madrid. The political chief S. Riesch was killed by the journalist Señor Llorente, who immediately fled to Gibraltar. The friends of the deceased proceeded to the newspaper-office and burnt all its contents.

PORTUGAL.—We have Lisbon news of the 12th inst. The Chamber of Peers had passed the Bill of Ways and Means for the present year. The Deputies were occupied with the measure lately introduced, endowing the Douro

Wine Company with an income of 150 contos of reis, derived from the duties on the export and consumption of wine at Oporto; and regulating the powers and obligations of the company, which is to open deposits at various foreign stations, and to purchase 20,000 pipes of wines of second and third qualities from the Douro wine-growers, at stipulated prices. The bill had nearly passed the Chamber of Deputies, and when agreed to by the Peers, the Cortes, it was expected, would be prorogued.—The tariff question had not made any further advance. The Ministry remained unchanged, save that Senhor Campelo, *ad interim* Minister of Marine, was stated to be ill, and Baron Tojal had been provisionally charged with his functions. Discussions had taken place in both Houses respecting the slaver Gloria, and it was supposed Senhor Campelo's illness was very much connected with his anxiety to escape from the discussions he might expect in both Chambers for his conduct in this affair.—The Queen and court have returned from Cintra to Lisbon for the season. The murder of a judge at Medoes had excited great sensation, and had led the Government to introduce a bill, to try cases of the kind by military tribunals, which was fully expected to pass into a law.

Belgium.—The two last acts of the session of the Chamber of Representatives are the chief topics in our Belgian news. By one of these a law passed approving the long-talked-of convention between the town of Brussels and the State. The public places, museums, collections, &c., of the capital will now pass into the hands of the Government, besides much real property belonging to the town—that is, as soon as the law has been assented to by the Senate, and received the Royal sanction. Brussels will therefore be relieved of the enormous debt caused by the revolution, from which, without the sale of its public places, it would never have been freed, and the capital will be enriched, beautified, and enlarged. As to the latter, some progress is already made—the *quartier Léopold* already rises from its foundations, and the boulevards that surround the town will soon cease to exist; the fosse will be filled in, the walls cast down, and the several gates be made to recede far from their present position. The last act of the session was the granting power to the Government to raise a loan amounting to 29,250,000 francs. Of this sum 24 millions are assigned for the railways; two millions for the making and improving the roads of Luxembourg; one million and a half for the *entrepôt* at Antwerp; and the remaining sum for the deepening of the canal from Ruppel to the canal of Bois-le-Duc. This vote will afford great relief to the working population of Flanders. More than 10,000 workmen are sure of employment for some years on the railroad from Ghent to Antwerp, for which all the preliminary preparations are made. The Provincial Council of Bruges has just come to a resolution ordering that statues of the illustrious men of the province of which Bruges is the capital shall be erected in the towns and villages in which they were born, and has voted the necessary funds for that purpose.—The *Echo du Monde Savant* states that a person possessing a large flock of sheep has cured the whole of them, which had the pleurisy, by giving to each animal an ounce of arsenic mixed with salt; and that he has used the same remedy on a cow, without the least indication of poison. M. Orfila, who is now at Brussels, will, it is said, ascertain whether the flock of animals so cured would be poisonous when used as food for man.

Hanover.—Accounts of the health of the King of Hanover have been received in town up to Friday last. His Majesty had recovered from the effects of his recent illness, and intended to take his departure from Dusseldorf on the following day, on his return to Hanover. The statement of the French papers, as communicated from Magdeburg, that the King has contracted a morganatic marriage with the widow of the Chief President, Von Beulwitz, is unfounded. The King has lately several times honoured the lady with a visit, who, notwithstanding her advanced age, retains her beauty and graceful manners. The journals, too, have spoken of her elevation to the rank of Countess of Dieplitz, which is supposed to have caused the report of the intended marriage of the King.

Germany.—The German papers speak of the *fêtes* on the Rhine as gay and popular, but still less brilliant than was expected, and productive of disappointment to those who looked for political excitement. A supplement of amnesty was expected from several princes; a mild, if not a liberal, law on the censorship was expected from Prussia; but the subject of politics seems to have been avoided by a mutual understanding, and it is agreed on all hands that there could not have been a fitter altar for the oblivion of political jealousies between Germans than the reconstruction of the great German Catholic cathedral by a Protestant Prince. Prince Metternich struck the stone at the same time with the King of Prussia; and the young Austrian Archduke, who attended the *fêtes*, was presented with a regiment by the King of Prussia. The people of Aix-la-Chapelle gave the King and Princes a dinner. The health of the Archduke was drunk, and was expected to lead to difficulty, as Aix-la-Chapelle was the ancient scene of the coronation of the Emperors, and was once peculiarly Austrian. The Archduke, however, got nobly out of the difficulty. He said, that since political arrangements and necessities had abstracted Aix-la-Chapelle from its allegiance to the Imperial House, he rejoiced in their loyal affection being transferred to so excellent a monarch and noble a race as those of Prussia.—On the 11th the people of Cologne gave a grand entertainment to the King and Queen of Prussia. The new market was formed into an artificial garden, at the entrance into which was erected a triumphal arch, surmounted by the Eagle and the seven banners. On the south side was a pavilion in the Moresque style, 60 feet long and 45 feet high, at the bottom of which was a fountain, casting out Eau de Cologne from amidst a bed of flowers. After remaining here some time, the royal party went through the streets, resplendent with illuminations, to the Tempelhaus or Rheingasse, so famous in story, the court-yard of which was converted into a ball-room. His Majesty opened the ball by dancing a Polonaise with the wife of the Burgomaster, and the Queen next did the Burgomaster the honour of dancing with him. A supper followed the ball, the Burgomaster's wife being admitted to the royal table—the only one who had the honour, besides the illustrious personages who accompanied their Majesties.—The *Augsburg Gazette* has just published a long treatise, running through a series of 23 numbers, on the German Customs Union and its future prospects. The writer recommends the extension of the Zollverein to the North Sea, to the countries situate at the mouths of the Rhine, the Ems, the Weser, the Elbe, and the Trave, which would comprehend Holland and Denmark; the accession of the Hanseatic towns, not as free ports in the manner England desires, but only with free magazines, such as exist in England, France, Holland, and in the United States; the creation of a system of general navigation; a treaty with Austria, comprising Hungary and Transylvania. The grand union would then extend to 70 millions of souls. The writer cautions Germany also against commercial alliances with England, France, and Belgium, whose efforts would only tend to ruin German industry; and, lastly, advises treaties of navigation and commerce, based on principles of complete reciprocity, with the independent states beyond the seas.—Letters from Dresden state that the ravages of the fire which broke out on the 31st August, in the Saxon and Bohemian Switzerland, and which continued on the 8th, extended almost the whole way from Winterburg to the Prebitscher, where the noblest pine-forest, intermixed with oak and timber of all kinds, has been destroyed to the extent of half a league. The appearance of the ground is said to be most extraordinary. On the scorched ground stand thousands of leafless trunks, of all ages and sizes, turned to charcoal from the root upwards, and stretching out their branches, blackened by flames, and the smoke in the ravines, formerly concealed from the eye by the thick foliage of the forest: thousands of them are witnesses of the dreadful conflagration; some still standing, others lying over each other, an impenetrable chaos.—The fires in the provinces of Saxony continued to be very serious; at Oschatz, on the road between Dresden and Leipzig, a third part of the town, in which are the largest and finest buildings, as well as the part inhabited by most of the woollen-cloth manufacturers, is reduced to ashes, together with the Senate-house, and other public edifices. The number of houses destroyed is 144, and that of the persons burnt out is from 1,500 to 2,000.—Letters from Salzburg state that the statue of Mozart was inaugurated with great ceremony on the 4th inst., in the presence of the Empress-mother, the King and Queen of Bavaria, Prince Luitpold, the Princesses Hildegarde and Alexandra, and other illustrious personages. A hymn, written for the occasion by Count Ladislas de Pirker, Archbishop of Erlan, in Hungary, and set to music by the Chevalier Neukomm, was performed by an orchestra of 2,000 professional and amateur musicians, who, as the Archbishop was confined to his house by indisposition, repeated the performance under his windows. Mozart's own Requiem was executed on the 5th, in the cathedral by the same performers.—The "Gazette of Upper Germany" announces that it has been decided to make Rastadt a fortified place of the first class, and that the works are to be commenced in the course of the autumn. It states that this determination to raise an imposing fortress opposite to Strasbourg has given very general satisfaction.—Nothing as yet has been done in the Baden Chambers, after a great deal of debating, but to affirm the principle of executing the railways by a Government loan. The shareholders of the Vienna and Warsaw Railway have given notice to the Polish Government that they are unable to finish their contract.—Letters from Trieste state that the Imperial Government will in the next spring commence the railroad between Vienna and Prague, which will run into that of Moravia, called Ferdinand Bahn. At the same period, the road from Vienna to Trieste will be continued between Marzuchlag and Gratz. There is no mention, however, of working upon the branch which is to lead from the Adriatic towards Styria.—We learn from Pesth that no topic is at present more frequently discussed by the Hungarian press, than the emancipation of the burghers, and the abolition of the immunity from taxation enjoyed by the nobles. These questions are to form the prominent subjects of discussion of the legislative session which is to open next spring. Of their own accord, and merely from patriotic motives, the nobles, it is said, will sacrifice their own privileges, and raise the burghers to their own level. At present the burghers enjoy no political rights in Hungary, have no voice in the election of their magistrates, no participation in the enactment of the laws. The reformers of Hungary are now resolved to remove this great reproach to the liberal policy which has been adopted in other departments of the state. The construction of a rail-road, at the public expense, to connect the plains of Pesth with the sea-coast at Fiume, is spoken of. A commission sitting at Pesth has also drawn up a liberal penal code, into which the penitentiary system of Philadelphia is to be introduced, while all corporal and capital punishments are to be abolished, and the principle of publicity adopted in all criminal proceedings. This will form the third great topic of discussion in the ensuing Diet. Transylvania has also followed the enlightened example of Hungary, in giving to every man an equal right to participate in the general affairs of the country, in abolishing capital punishment, and giving the peasants power to possess and dispose of any property they may acquire. In regard to the long-disputed question of mixed marriages in Hungary, the Bishop of Grosswaradin, who is one of their most decided opponents, has resigned his see, and has been created by the Pope an Archbishop *in partibus*. From this it is inferred, that the question of mixed marriages will be decided in the next Diet in favour of the Protestants. The prelate has made an immense sacrifice to his principles, as the revenue of his Bishopric amounted to 200,000 florins, about 20,000*l*.

Italy.—Letters from Pisa of the 5th inst. state, that the town was thrown into general consternation on that day by the following dreadful accident. While upwards of 200 persons were assembled at an amphitheatre, near one of the gates of the town, engaged in the game of pallone, a wall suddenly sank under them, brought down other parts of the building, and buried them in its ruins. Immediate exertions were made, and the dead body of a child was first taken out. 56 persons were found severely injured, the lives of several being despaired of. The rest escaped, some with slight bruises, the others unhurt. Many of the sufferers belong to the first families of Pisa.

Russia.—Advices from St. Petersburgh of the 3d inst. announce, that on the 31st the Emperor published a manifesto, ordering that the daughter of the Czarewitch, whose birth on the previous day was announced in our last, should receive, in every circumstance, the title of Grand Duchess and Imperial Highness.—A scientific expedition, undertaken with the aid and under the direction of the Academy of Sciences of St. Petersburgh, was on the point of leaving the capital, on an exploration of the extensive region of Siberia comprised between the rivers Pjasida and Chatanga and the Icy Sea, which has never yet been trodden by the foot of man. M. Widdendorf, Professor of Zoology in the University of Kiew, was to direct the expedition, and had received for that purpose a gift of 13,000 rubles from the Emperor.—A Russian ship of the line, a new 74, going from Archangel to the Baltic for her stores, was lost on Sunday week on the coast of Norway, off Christiansand, with about 400 men. The wind was a high northerly gale, off the land, and it is not known whether she sprung a leak or was out of her reckoning, but many reports, all unfavourable to the captain and officers, were in circulation at Gottenburgh.—The Malta papers of the 27th announce that the Russians had experienced another check in Circassia. The insurgents surprised at night and cut to pieces a body of about ten thousand men, encamped under the walls of Mazga, and made themselves masters of that fortress, which they entered together with the fugitives. Such was the rapidity with which the mountaineers came on, that the Russians had no time to form; nearly the whole of the troops in the camp were put to the sword, and a number of officers were made prisoners.—According to private letters from Kalisch, changes are about to take place favourable to the inhabitants of Poland. The Emperor, it is said, has issued an ukase, which directs that in Warsaw, and probably in all Poland, the Polish language shall be again used as the channel of instruction in the schools, and that 12,000 Polish troops shall be organised and commanded by Polish officers, except the staff officers, who are to be Russians. It is believed that the Poles will be indebted for this change, if it should take place, to the visit of the King of Prussia to St. Petersburg.

Turkey and Syria.—The accounts from Constantinople, dated the 31st ult., are of considerable importance. They state that on the 30th Izzet Mehemet, the Grand Vizier, was deposed, and Raouf Pasha, former President of the Council, elevated to his post. Halil Pacha, brother-in-law to the Sultan, had been appointed President of the Council in Raouf's place. The overthrow of Izzet had caused great satisfaction to the whole of the diplomatic body, who saw in him the promoter of the policy that prevailed of late in the councils of the Sultan, to the detriment of the empire. The Hatti-Scheriff dismissing him, alleges as a reason his incapacity to bring to a good termination the important negotiations entrusted to him. The change is attributed entirely to the Sultan. Selim Bey had returned from Syria, bringing with him memorials calling on the Porte to name a Mussulman Governor for Lebanon, which he had prevailed on the majority of the Maronites themselves to sign. Fresh disturbances had taken place on the Persian frontiers, and the increasing discontent in the European provinces had induced the Divan to order a concentration of troops at Nissa and Monastir. Baron de Bourqueney had declared to Sir Stratford Canning, who had questioned him respecting the presence of the French squadron under Admiral Lasusse at Beyrout, that its stay there would be merely temporary, and that it was even probable it had already left the coast of Syria. The "pious embassy" departed for the Holy cities of Mecca and Medina the 23d ult. with the usual solemnity, after receiving from the Sultan the sacred carpet and the other presents destined for the tomb of the Prophet. The *cortége*, composed of a large number of pilgrims of all classes, set out preceded by the bands of several regiments of the guards. The first wife of Sultan Mahmoud, the mother of the wife of Said Pacha, and of the unmarried sister of the reigning Sultan, accompanied the caravan. This is the first time a Sultana has ever proceeded on a pilgrimage to Mecca.—The Greek population of Smyrna have just lost their patriarch Anthimos, at the advanced age of 96.—Accounts from Belgrade state that Prince Michael of Servia has met the same fate as his father, and been driven into exile. The party of the emigrants, commanded by Voutchilch, attacked and got possession of the arsenal of Kragujewitz. Prince Michel tried to dislodge them in vain. After two days' fighting the Prince was abandoned by his troops, and obliged to take refuge first at Belgrade, and, not considering himself in safety at that place, he had repaired to Semlin, and invoked the protection and aid of Austria. The Consuls of Great Britain and France had accompanied the young Prince in his flight. The insurrection has been planned and carried into execution for the restoration of Prince Milosch. Its leader was one of his ex-Ministers, openly encouraged by Russian agents, by Chekil Effendi and the Pacha of Belgrade.

United States.—The packet-ship Cambridge arrived at Liverpool on Thursday from New York, from whence she sailed on the 1st inst., bringing papers to that date inclusive; they are, however, only one day later than those previously received by the Britannia steamer, and they contain no intelligence of importance. The Swedish Minister was among the passengers. Lord Ashburton's reception by the citizens of New York was a brilliant affair, and attended by all the British, French, City, and other authorities. At Boston his Lordship was visited by a large body of the Massachusetts legislature, preceded by their Sergeant-at-Arms, and appropriately addressed by the Hon. W. J. Hubbard, of the Senate.

Cape of Good Hope.—We have Cape papers of the 20th July, containing the official despatches from the British camp at Port Natal, dated the 30th June, giving the particulars of the relief of Capt. Smith and the gallant handful of troops under his command. This important service was accomplished by Lieut.-Col. Cloete, assisted by her Majesty's frigate Southampton, commanded by Capt. Ogle, R.N., and Capt. Durnford of the 27th Reg., with 100 men and two small howitzers. Colonel Cloete speaks in the highest terms of the conduct of Capt. Smith. The gallantry, he observes, with which Capt. Smith defended his post for a whole month, under no ordinary circumstances of privation, is highly creditable to him and his party. They were reduced to horse-flesh for food, closely hemmed in by a desperate and vigilant foe, with no less than 20 wounded within his closely confined camp. The relief was effected within the incredibly short space of one month, although the distance to Natal from Cape Town is 1,500 miles, and although Capt. Smith's despatch, announcing his situation, was delayed by having had to pass through hostile hands. Capt. Smith states, that nothing could exceed the patience and cheerfulness of the troops under the privations they suffered, and had it been necessary, they could have held out for a longer period without a murmur. His loss was one serjeant, two privates killed and three wounded; one Cape rifleman and one civilian killed, exclusive of his previous loss formerly detailed. The number of boers who defended the landing and possession of the harbour against the relief attack of the Southampton was 350 men, but their loss has not been ascertained. This intelligence has given unqualified satisfaction, as various discouraging rumours, which we noticed in our last, had prevailed at Cape Town in the early part of the month respecting Capt. Smith and his small detachment of troops, the general notion being that the whole of them were either made prisoners or killed; it was, moreover, doubted whether the experience of Lieut. Colonel Cloete, who was despatched on the same service, was such as could be fully confided in. Subsequently, on the receipt of the above intelligence from the scene of warfare, this gloomy state of the public mind was effectually relieved. The new commander was found to have executed the task assigned him in the most meritorious manner, and with the greatest success. Both officers and men acquitted themselves with admirable gallantry, and the only mistake said to have been committed, was that of undervaluing the strength of the enemy in the first instance, an error often committed by English commanders during the last war. The position of the rebellious boers seems to have been very serious; they persisted in their revolt, and being of course unsupported by any lawful authority, the savage Aborigines threatened to fall upon them for the purposes of plunder. If their revolt continued, little doubt was entertained that they would be exterminated by the natives.

CITY.

Money Market, Friday. — Business has been very heavy during the week, and little improvement took place yesterday. Consols closed at 92¾ to ⅞ for money, 93 (sellers) for the account. New Three-and-a-Half per Cent. Annuities were 100⅞ to 1; India Sock, 249 to 51; India Bonds, 36*s.* to 38*s.* prem.; Exchequer Bills (2*d.*) 49*s.* to 51*s.* prem.; do. (2¼*d.*) 51*s.* to 53*s.* prem.

Metropolis and its Vicinity.

Arival of her Majesty.—From the late hour of her Majesty's landing on Saturday, we were only enabled to announce her safe arrival in our last. It was generally expected that the Trident would have reached Woolwich on Friday evening: and several persons of rank connected with the Court and Admiralty remained in attendance at the Dockyard during the night. The troops were under arms, and the yard was a scene of bustle and excitement until day-break. As the morning advanced, the Dockyard became crowded with company. The Earl of Haddington, first Lord of the Admiralty, was early in attendance, with the Earl of Jersey, Lord Bloomfield, and several other noblemen and official personages. Shortly after nine the Black Eagle and Rhadamanthus Government-steamers made their appearance, and no long period elapsed before the distant sound of firing gave evidence that the Trident, which had been at anchor off the Nore for four hours and a half, in order to allow the Black Eagle to arrive first with the ladies in waiting, was not far in their wake. The approach of this splendid vessel, and her stately trim, were much more imposing than the scene at her Majesty's departure. A fine easterly breeze was blowing; and from the state of the tide, half-flood, a considerable number of fine large steamers accompanied the Trident on her progress up the river. Three large vessels, in particular, two ships, and a barque, in tow of tug-boats, and gaily dressed with flags, gave an imposing appearance to the fleet; while the steamers around, being all large sea-going boats, formed a much more majestic escort than the flotilla of river craft which accompanied the Royal George to the Nore. At ten o'clock the Trident was opposite the Dockyard, and surrounded with a numerous fleet of boats. An Admiralty barge, steered by Sir Francis Collier, was shortly at the gangway; the accommodation ladder, covered with green cloth, was rigged out, and at half-past ten her Majesty and the Prince landed, amid the cheers of the assembled multitude, and the salutes of the cannon. The royal standard was then struck on board the Trident, and hoisted in the Dockyard; the troops, which were drawn up in double lines, presented arms; and the royal carriage drove rapidly along amid the loud acclamations of the crowd. Her Majesty looked somewhat pale, but was animated and cheerful; she wore a tartan satin dress. The Prince, who was in plain clothes, appeared rather sun-burnt. A numerous party of police patrolled the route taken by Her Majesty, and the utmost excitement prevailed along the whole line. The Royal carriages proceeded through Deptford, Peckham, and over Vauxhall-bridge, through Hyde-park, to the terminus of the Great Western Railway, where Her Majesty arrived at a quarter-past 11. The directors of the Company, to prevent delay, had directed a special train to be in readiness for Her Majesty's use from 7 o'clock on Friday evening; and the principal officers of the Company were kept in attendance during the night. Her Majesty and the Prince were received by Mr. C. Russell, M.P., the Chairman of the Company, and by other officers, and immediately left for Windsor, where they arrived at half-past 12. Previously to Her Majesty's return, the Lord Mayor received a letter from Sir J. Graham in answer to one from his Lordship, requesting to be informed whether it would please the Queen that he should meet Her Majesty, as Conservator of the Thames, on her return to London. It stated that, as the time of Her Majesty's arrival was uncertain, she wished all ceremonies of the conservancy of the river Thames to be dispensed with.

Buckingham Palace.—The works in progress for the erection of a new Conservatory at the Palace have been suspended. The furniture in the state apartments has been covered up, and some of the rooms dismantled, as, according to the present arrangements of the Court, Her Majesty will not come to town until the latter end of January.

Court of Aldermen.—On Thursday a Court was held, avowedly for the purpose of confirming the Sheriff's nomination of Mr. Burdon to the office of keeper of White-cross-street Prison. Mr. Burdon was unanimously approved by the Court, and every member took the opportunity to express their respect for the memory of the late Mr. Barrett, to whose family they wished to vote a letter of condolence. Sir P. Laurie observed that it was most gratifying to find that no demand was made upon the funds of the corporation by the family of the deceased, who was remarkable for high principle and the most active humanity. The matter was referred to a committee. —A long discussion then took place with reference to the ensuing mayoralty. Alderman Thomas Wood, the first candidate in succession for that office, had been accused by the "Mining Journal" of certain suspicious proceedings in connexion with the Talacre Coal Company, which suspicions were, as several members of the Court maintained, confirmed by the Court of Queen's Bench. Alderman Wood offered a full explanation of the circumstances, but several members of the Court expressed dissatisfaction, and said that they would vote against any candidate where the charges were left so doubtful as in the present case. After a long discussion, Sir P. Laurie moved that the Court should go into committee on Saturday or Monday on the subject. Alderman T. Wood approved of the motion, and said he should submit all the papers to the committee. He was determined to have inquiry, and had never refused to give all the information in his power, and never would refuse to answer any questions. The question was then put and negatived, four hands having been held up for it and five against it. The matter remains for future discussion.

Public Meetings.—On Wednesday the first general meeting of the West India Mail Steam-packet Company was held at the London Tavern, and was most numerously attended. Among the parties present were the leading merchants connected with the West India Colonies, Mexico, and the Havannah, and the greatest anxiety appeared to be manifested to see what course the proceedings would take, since the misfortunes which have attended the operations of the company have been a fertile topic of discussion among all engaged in business with those parts. Mr. J. Irving, M.P., was in the chair. The report ran to a great length, and took a general review of the history and proceedings of the Company. It stated that the combination at first acted upon involved a steam service of 684,816 miles in the year, and though it was tried with 14 vessels, yet the directors became satisfied that it could not be performed with certainty without one, if not two, more steam-vessels. The plan now to be employed involves the employment of only 12 steam-vessels, and a steam service of only 392,976 miles in the year. The report described this change as a very important improvement in the position of the Company, the payment from the Government continuing the same; and it expressed the belief of the directors that the contraction of the work will not be attended with a corresponding or any essential diminution of the income from passengers, freight of money, &c., whilst the expense of conducting the same will be reduced. In regard to the financial position of the Company, the report stated that the capital under the charter consists of 15,000 shares of 100*l.* each; 14,840 have been subscribed, and upon which calls amounting to 50*l.* per share have already been made, and the sum of 725,645*l.* has been received, leaving 16,355*l.* in arrear, 9,000*l.* of which is due upon shares which are the subject of litigation. Besides the 725,645*l.* thus actually received from shareholders, the directors have found it necessary to raise by way of loan the further sum of 260,000*l.*; and there still remains to be paid to builders and others about the sum of 20,000*l.*; and they estimate the amount expended in the nature of capital at rather more than 1,000,000*l.* In regard to the actual working of the undertaking from the 1st of January up to the 31st of August in the present year, it appeared that the cost for working for that period amounted to 209,489*l.*, and that the earnings during that time were 214,296*l.*, leaving a balance of only 6,807*l.* towards providing for cost of insurance, wear and tear, and return on capital. It also appeared that the sum expended on account of capital exceeds the amount raised upon the shares by about 275,000*l.*, which latter sum it will be necessary to provide; and it is intended forthwith to make a call of 10*l.* per share, by means of which and by the sale of such of the vessels as will not be required for the reduced service, the directors hope that the undertaking can be satisfactorily carried out without making further calls upon the shareholders. The report concluded by stating, that the expense of working the entire service under the old system would have amounted to upwards of 360,000*l.* per annum, exclusive of insurance, wear and tear, and interest on capital; whilst the charge under the restricted system is estimated at about 235,000*l.* The ultimate income, it is said, must at all times be uncertain; but the directors were of opinion that their receipts from passage-moneys and freight, together with the 240,000*l.* which will be continued to be received from Government, will be adequate for a dividend on the future operations of the Company. After the reading of this report, a long and angry discussion ensued, which ended in a motion for the printing of the report and bye-laws, and the adjournment of the meeting, which was carried on a division by a large majority. During this discussion the chairman admitted, in reply to Dr. Bowring, that the accounts had not been audited, and several proprietors warmly urged the immediate dissolution of the company as the only means of preventing greater misfortunes.

Christ's Hospital.—On Wednesday, being St. Matthew's Day, the annual orations were delivered, in presence of the Lord Mayor and other civic authorities, by the senior scholars of Christ's Hospital, in the great hall of that ancient institution. In the morning, the Lord Mayor, Aldermen, and Sheriffs, with the Governors of the several Royal Hospitals in the metropolis, attended Divine service at Christ's Church, Newgate-street, where a sermon, appropriate to the occasion, was preached by the Rev. W. Harrison. At the conclusion of this service, the civic functionaries and Governors repaired to the great hall of the Hospital, where a very crowded assemblage of visitors had already arrived. There was a large attendance also of the metropolitan clergy, and of members of the leading mercantile families of London, who have always exhibited a laudable energy in advancing the interests of an institution which is at once an ornament and an honour to their city. The Latin Oration, on the benefits of the Royal Hospitals, was spoken by Mr. G. E. Pattenden, second Grecian; the English Oration, on the same subject, by Mr. P. H. Hamill, first Grecian; the Greek Oration, on the same subject, by Mr. W. H. Brown, fourth Grecian, Classical Medallist, and "Thompson Exhibitioner;" and the French Oration, on the same subject, by Mr. W. Romanis, third Grecian, and "Times" Scholar; all of whom are proceeding to Cambridge. The Recitations then followed, and passed off in the most satisfactory manner. At the conclusion of the ceremony the usual subscriptions were entered into for the benefit of the scholars proceeding to the University.

The River Navigation.—The harbour-masters have given notice to the captains of steamers, that in future they will only be allowed to run at half-speed in the Upper Pool, and that any violation of this regulation, or racing between rival steamers, will be seriously noticed, and the offenders summoned before the magistrates.

The Markets.—At Guildhall, on Tuesday, a conversation took place between Sir Peter Laurie and Mr. Venables, of Newgate Market, respecting the importation of foreign cattle. Mr. Venables said that the importation was increasing. There were some very fine Spanish cattle in Smithfield market on Monday. The price paid in Spain was very low, and the importers had made a good profit. An importation from Spain had not been expected, on account of the length of the voyage, but they came in good condition for killing. No foreign meat, however, was equal to our own. In regard to the cattle of Belgium and Holland, what had been received from that quarter was certainly very fine, but they put ten beasts to graze on a plot that would be given to three in England. An acre of land would only support one beast and a sheep. Sir P. Laurie asked what reduction had been effected in the price of meat? Mr. Venables replied a halfpenny a pound. Prices, he said, would never rise again above the present level, and it was clear they must go lower in a year or eighteen months. Large quantities of American salt pork were coming in. It was a very superior article, and the sale would be extensive. At the Barnet fair just closed no cattle could be sold but at a reduction of 3l. a head on the last year's prices. On the last day of the fair 22,000 cattle remained unsold, while on the same day of the last year not one head remained unsold as early as 2 o'clock. In regard to the unsold beasts, they would be driven about to other fairs, and sold at the same reduction of 3l. a head. The graziers were suffering now, but ultimately the landlords must bear the loss.

The New French Church.—The French Protestant Church, which has lately been built as a substitute for the one which formerly stood in Threadneedle-street, on the site now occupied by Mr. Moxhay's new building, is nearly completed, and will be opened for divine service in the course of next month. It is built under the powers of the Charter granted by Edward VI. to the French Protestant Consistoire, which commends the order to the care and protection of the Archbishops and Bishops of this realm. The cost incurred in its erection, including site, is estimated at between 7,000*l.* and 8,000*l.*, which has partly been defrayed out of the funds at the disposal of the order for supporting their aged members, and partly out of the compensation made them by the city authorities on the removal of the old church in Threadneedle-street. It is built in the florid Gothic style. M. Martin and another French divine have been appointed to officiate by the Consistoire, in whom the patronage is vested.

Wood Pavement.—A portion of Piccadilly, extending from Albemarle-street to Bolton-street, is now laying with wood pavement, in consequence of which that portion of this extensive thoroughfare has been for some days closed up, and carriages have been compelled to go a long way round. The wood pavement is laid 18 inches lower than the foot pavement, and the carriage way between Bond-street and Albemarle-street has been taken up and relaid on an inclined plane, so as to accord with the height of the wood pavement.

The Registration.—Two cases of some interest connected with the Registration have been brought under the consideration of the Revising Barrister for Marylebone. The first was a question of considerable importance, which will affect the votes of all assessors and collectors of the Income Tax; it was argued on the claim of a Queen's tax collector, and a newly appointed assessor and collector under the Income-tax Act, for a house his own property. Mr. Ivimey, the solicitor of the Marylebone Reform Association, who has objected to the whole of the assessors on the same ground, said the question was whether an assessor under the Income-tax Act is legally qualified to vote, inasmuch as they were employed in the collection of the Income-tax, in receiving the duties on houses, without the protection afforded by the Act of Parliament to assessors and collectors of land-tax. The claimant said the commissioners of income and property were selected from land-tax commissioners exclusively. They consisted of seven persons, and he received his appointment from two of the seven, precisely as he did under the land-tax commissioners. He had no salary whatever as an assessor, but was to receive a poundage as a collector. The Revising Barrister said the point was of course a perfectly new one, and of such importance that he must take time to consider his judgment. In the second case, a tradesman claimed in respect of a house in Wells-street, and was resisted on the ground that he had tendered the payment of his rates in light gold, which the collector had refused to take, and that, therefore, he had not made a good and legal tender within the meaning of the Reform Act. In answer to various questions put to him, the claimant admitted that he had made no offer to the collector to make up any deficiency that might arise in the event of the gold proving to be light. The solicitors on both sides observed, as this case would affect a large number of votes, they were willing to leave the matter entirely in the hands of the Court. The Revising Barrister said that, notwithstanding a proclamation had been issued by the Queen with reference to the light coin, still he conceived that a tax-collector had no right to refuse her Majesty's coin. He considered it would be exceedingly hard on the voter that he should lose his vote in consequence of the money tendered being a fraction under the proper weight. He held the tender of light sovereigns to be a perfectly legal tender, and should allow the claim.

City Omnibuses.—Some omnibuses of a novel description have lately been plying between Islington and Chelsea. They are provided with a small brass box on the left side of the door, in which are placed three drums marked with figures; the first with units as far as nine, the second with tens as far as ninety, and the third with hundreds as far as nine hundred. Passengers entering the vehicle press upon some iron rods, similar in their action to the toll-gates on Waterloo-bridge. These rods are connected with a brass tube under the roof, which, acting like a key upon the drums, cause each passenger to mark his number, so that the proprietors are enabled at the end of the day to ascertain how many persons their omnibus has carried, without trusting to the conductors. The rods also serve the purpose of assisting passengers to their seats, and of preventing the liability to accident by the omnibus suddenly moving on. They are about to be started on the Hampstead-road, and to the Bank, and are called by the proprietors "Indicators." By the new Act relating to stage-coaches and omnibuses, which comes into operation on the 3d of October, the average space allotted to each passenger is required to be sixteen inches, measuring in a line lengthways on the front of each seat. Children below five years of age, sitting in the lap, are not to be deemed passengers within the Act. The number of passengers which such carriage is constructed to carry, is required to be legibly painted both inside and outside, for the information of travellers.

The Fire Brigade.—Within the last few days, Mr. Braidwood, the superintendant of the fire brigade, has caused to be distributed to every policeman in the Metropolis and its suburbs, printed instructions for the purpose of preventing the spread of fire on occasion of its outbreak. The instructions contain the situation of the whole of the stations of the fire-engine establishment, where there is constant attendance of engines and firemen night and day. It then proceeds:—"Any police constable who first discovers a fire, without having his attention called to it by any one, is allowed by the establishment a sum not exceeding ten shillings, provided no human lives are lost. Upon a discovery being made, it is exceedingly prudent to prevent the flames from spreading, to keep shut the doors and windows of the premises, after the escape of the inmates, till the engines have arrived, or water is procurable to be thrown on to the fire, as nothing causes it to burn so rapidly as the admission of air."

Deptford.—On Saturday, the Priscilla timber-ship, of Plymouth, was towed up to this dockyard from the Downs, having made her passage across the Atlantic under circumstances of peculiar difficulty. She has been engaged in the timber trade for some time past. It appears that, in shipping her last freight at Quebec, great want of caution must have been observed, for, during the voyage, while under sail on the larboard tack, her cargo shifted, and threw the vessel completely on her beam-ends. The weather was fortunately calm, or the ship must inevitably have been lost. Much skill was necessary in navigating her home, as the result of making any sail after the accident occurred, except under circumstances of the greatest caution, must have been her total loss. Her appearance in passing up the river attracted much attention; the masts, instead of being perpendicular, formed an angle of about 45 deg., and she is still the subject of much observation by all persons passing up and down the pool. An accident of this nature, with a similar result, is of rare occurrence; the loss of timber ships under similar circumstances is notorious, and legislative interference has been frequently suggested as to the mode of loading vessels in the colonies.

Fires.—On Thursday morning, shortly before 1 o'clock, an alarming fire broke out in Whitbread's brewery. The firm have long been in the habit of manufacturing their own gas, and the private watchman observed a strong glare of light through the windows of the building containing the apparatus. The private engines were got out and several others soon arrived, when, a good supply of water being obtained, the progress of the fire was confined to the building. The accident is supposed to have originated through the gasometer having been overcharged; the damage is considerable.

Accidents.—Mr. Hardinge, son of the Right Hon. Sir H. Hardinge, Secretary at War, met with a serious accident on Monday morning. He was on his way to town from the family seat in Kent, and on landing from a steamer at Hungerford, by some means his foot was jammed between the vessel and the pier. The injuries he sustained were very severe, and immediately on being conveyed to the family mansion in Whitehall-gardens, two medical men were called in. It was judged expedient by those gentlemen, in order to obviate fatal consequences, that the affected leg should undergo amputation above the ancle, which operation was performed with every success. —Intelligence has been received in town of an accident to the Right Hon. W. E. Gladstone, Vice-president of the Board of Trade. It appears that he was on a visit to Hawarden Castle, and during a shooting excursion on Wednesday, the 14th, whilst in the act of reloading one barrel of his gun, the other by some means was discharged, shattering the fore finger of the left hand to such a degree, that his medical attendants decided upon amputation, which was immediately performed.—The local papers mention a melancholy accident, which has led to the death of the youngest son of the Hon. G. C. Norton, the magistrate of Lambeth-street Police-office. It appears that on Monday week he was riding a small pony, which became unmanageable and ran away with him, at Chapelthorpe, near Wakefield. Before proceeding far he fell from his pony, and on examination his face and arm were slightly grazed. The boy soon recovered his usual spirits, and the wounds appeared to be doing well. On Friday he was sent out as usual; on Saturday symptoms of lock-jaw were visible, and he died on Sunday.

Mortality of the Metropolis.—The number of deaths from all causes registered during the week ending Saturday, Sept. 10, was 864: males, 407; females, 457; weekly average, 1838-39-40-41—males, 467; females, 445. This mortality was distributed over the different districts as follows: South districts, 197; East districts, 194; Central districts, 170; North districts, 167; West districts, 136.

Provincial News.

Manchester.—Accounts were received in town on Saturday of another outbreak at Salford. It appears that on Thursday an attack was made on Messrs. Garstang's factory, in that town, which was at an early hour visited by a large mob of men and women: the hands were turned out, and the windows broken. The mob thence proceeded to the factory of Messrs. Morris, on Oldfield-road, where a number of strangers are employed as weavers instead of the turn-outs. At this place, however, they were repulsed by the hands of Messrs. Morris, who were armed for the purpose of self-defence. The men also took three of the ringleaders into custody, and handed them over to the police. After this the mob held a meeting in the Chartist-room, George-street, when resolutions were come to that they would not resume work until they obtained the wages they had in 1839. In the course of the afternoon reports were received at the Town-hall, Manchester, that mobs were collecting in various parts of the town, particularly in the neighbourhood of the large factories in the Oxford-road, belonging to the Twist Company, Messrs. Birley and Mr. Marsland. A number of windows were broken, and the mob threatened to turn out the hands. On the arrival of the police, it was found that the mob, after breaking the windows, had proceeded towards Gaythorne. The superintendent went in that direction at a rapid pace, and found a mob of from 700 to 1,000 persons on the point of leaving the mill of Messrs. Fernley, having broken about 100 windows. On his making his appearance, the mob turned round, and were requested by a man, who seemed to be the leader, to face the police. They halted, and seeing this, the superintendent hastened to fetch his force. On their appearance the mob fled in all directions, but the leader was chased through various courts and narrow streets, and after a run of twenty minutes was taken into custody and lodged in the New Bailey. In the evening the police succeeded in capturing several other parties known to have taken an active part in the riots. The town continued in a state of great excitement until a late hour of the night. In the neighbourhood of the factories and on the Ashton road large bodies, principally of young females, marched in procession, singing that they would not go to work until they obtained the advance. In the course of Friday meetings of the turn-outs were held in various parts of the town, at which a man named Massay said he had marked several families who had gone to work in the Regent's-road mill. The meetings were, however, dispersed by the police, and several of them, on the remonstrance of Col. Wemyss, separated. In the course of the afternoon a man named Lyons, one of the persons who attempted to turn out the hands at the factory of Messrs. Morris, in Salford, died from the wounds inflicted on him by the hands in the encounter. This affray seems to have produced a considerable degree of exasperation amongst the turn-out power-loom weavers and the Chartists, who plainly asserted that the man was a mere passive spectator, and had met his death by unfair means. The inquest was adjourned to Wednesday; but, in the mean time the coroner issued his warrant for the funeral. This gave rise to another attempt to break the peace, on Monday; and the inhabitants generally were much alarmed for the result. As soon as the coroner issued his warrant to make the friends of the deceased rioter inter the body, the weavers determined to get up a manifestation of strength, by forming a procession with the body to the grave, and the magistrates immediately put forth a proclamation, declaring such processions illegal, and their intention to suppress it if attempted. Notwithstanding this caution an immense number of persons congregated and formed in line after the corpse. They were met by the magistrates and the police, about a quarter of a mile from the place of burial, when they were dispersed, the relatives of the deceased alone being permitted to follow the corpse. In the interior of the burial-ground where the deceased was to be interred, a large concourse of persons was assembled, who behaved with decorum. The Rev. Mr. Schofield, having mounted the monument erected to the memory of the late Mr. Hunt, delivered a funeral oration. The crowd then joined him in singing a hymn, after which the solemnity was concluded. During the time occupied in the funeral service, the mob, which had been cut off from the procession, taking advantage of the absence of the police, who were watching the chapel of Mr. Schofield, repaired to the power-loom mill of Mrs. Ritson, in Canal-street, about a quarter of a mile distant, where they speedily demolished the windows and window-frames with sticks and stones. The whole of the lower part of the windows and frames were smashed, and upwards of 200 panes in the upper story. The mob were off before the arrival of the police. In the course of the evening another mob broke a number of windows in the factory of Messrs. Morland, in Oxford-road, and afterwards escaped with impunity. Nothing has since occurred to excite apprehension, and many weavers have returned to work.

Stockport.—On Monday morning the inhabitants witnessed the novel sight of a general resumption of labour in this town. All the factories are now at work, and nearly with a full complement of hands. In all parts of the town there has existed the most protracted distress and the most prolonged turn-out. It is, therefore, to be hoped that industry will now resume its wonted course, and extend comfort and plenty.

Ashton.—A man named Pilling, the leader of the Chartists of this town, and six or seven of his associates, have been arrested and committed for trial on a charge of conspiracy. They were apprehended at a Chartist meeting in Charlestown, and as Ashton has been considered the centre of the recent outbreak, it is expected that the seizure of the parties under whose directions it was carried into effect, will be productive of the best effect.

Stafford.—Mr. Maule, solicitor of the Treasury, arrived last week in this city, to make arrangements for the special commission, which commences on the 1st of October. According to the arrangements there are to be three courts, over which Mr. Justice Tindal, Mr. Justice Park, and Mr. Sergeant Rolfe, are to preside. The Attorney and Solicitor-General, and Mr. Sergeant Ludlow, Mr. Godson, and three others, are to prosecute for the Crown. Mr. Herbert has received instructions to conduct 30 of the cases, amongst which are those against Mr. O'Neil and Mr. Linney.

Glossop.—The turn-out in this hitherto peaceable vale is not yet at an end: most of the mills are still idle. It will be in the recollection of our readers that Mr. Cooper, an extensive manufacturer in the neighbourhood of this town, had his hands turned out, and his factory stopped, about three weeks ago, and that on the 24th ult. he and two of his sons gave evidence before the magistrates against several of the rioters, who were in consequence committed to Derby gaol for trial. On their way home Mr. Cooper and his friends and two of his sons were attacked by a furious mob, severely beaten, and one of Mr. Cooper's sons left in a field in a state of insensibility. Connected with this attack, a person of the name of Howard, a boy about 18 years old, has been committed by the magistrates to Derby gaol to take his trial for the offence. A respectable looking man, named Koe, has been apprehended on several charge of conspiracy, attending illegal meetings, &c. The evidence established the fact of his attendance at the meetings, which the magistrates declared to be illegal; they committed him for trial, but took bail for his appearance.

Preston.—In obedience to the writ for the Special Commission on the 1st October, the High Sheriff has issued summonses to about 100 jurymen in different parts of Lancashire. On Friday two of the rioters in the tumultuous proceedings on the 12th of August were apprehended, and committed for trial. Along with several others, who are well known, and for whose apprehension warrants have for some time been issued, they had kept out of the way until the restoration of tranquillity emboldened them to return into the town. The prisoners who were wounded in the collision with the troops are still in the House of Correction, and it will be some time before they can leave the institution; but in consequence of their sufferings the Recorder has informed them that although some of them have been recognised as amongst the most active leaders of the mob on the fatal occasion, their prosecution will not be proceeded with.—In connexion with the new military arrangements for the northern districts, Preston is to become the future depôt of a large assemblage of troops. There have hitherto been no barracks in the town; and the troops now there, consisting of about 130 Rifles, are quartered in temporary barracks in a factory in Water-street. A site of 25½ acres on Fulwood-moor, the property of the Duchy of Lancaster, and in the centre of the former race-course, has been selected by Government for the erection of cavalry and infantry barracks capable of containing 2,000 troops. An active correspondence has lately been carried on with the Board of Ordnance, and it is expected daily that estimates for the contracts for the works will be published.—All vestige of the Guild for another twenty years passed away on Friday night, when a tradesman's fancy and dress ball was held at the Guild-rooms in the Corn Exchange, and at which about four hundred persons attended. The total sum received on the occasion of the Guild was about 2,500*l.*, and after the payment of all expenses there will remain a surplus of about 300*l.*, which will be devoted to the public charities of the town. A sum of 50*l.* has been awarded to the different Catholic, and one of 65*l.* to the Protestant schools, being in the proportion of about 3*d.* per head for each scholar, and a large sum will be given to the House of Recovery. The quantity of dresses sent down for the occasion was very great, the stock of one habit dealer weighing upwards of 25 cwt. Notwithstanding the large influx of strangers, the number of robberies was less than usual; the police apprehended forty suspicious characters during the week, who were committed for trial, or held to bail, besides which many others were detected and ordered out of the town. Two females still remain in custody on suspicion of the late Bank note robbery. A strange story has been going the round of the papers, copied from the "Lancaster Guardian," stating that the Duke of Brunswick was arrested here by mistake, on Thursday, as one of the parties implicated in the robbery, and that the Magistrates had made the most ample apologies for their error. The whole statement has been contradicted by Baron Andlar, Equerry to his Highness, as entirely untrue and without foundation, and the Duke has directed legal proceedings to be taken against the parties with whom it originated.

Bolton.—The spinners who gave notice to the masters a fortnight ago that they would cease work unless they obtained advanced wages, turned out on Saturday as they completed their weeks' work. Four hundred spinners, affecting five times that number of other descriptions of hands, turned out. The notices of 64 other spinners will expire this week. This will produce a great amount of distress in the borough, unless steps be taken to bring about an amicable settlement of the dispute.

Brighton.—It is said that her Majesty and Prince Albert intend to honour this town with a visit about the end of October, and to remain at the Pavilion about a month or six weeks. The Inspector of the Household at Brighton, who is the agent for the Lord Chamberlain at the Pavilion, will, it is expected, receive the usual directions from his lordship to prepare the Pavilion for the reception of the Court after the contemplated visit of her Majesty next week to Claremont. The Princess Royal derived much advantage from the air of Brighton at the last visit of the Court, and Prince Albert expressed himself pleased with the place.

Devizes.—The Wiltshire papers mention with great satisfaction the proceedings taken by Mr. Starky, one of the county magistrates, in regard to a woman, named Easter, who was sentenced to death at the last assizes. The case was reported in this Paper at the time, and our readers will remember that she was found guilty of the murder of her child on very slight and contradictory evidence, and to the surprise of the whole court. Mr. Starky, from a conviction of the woman's innocence, prepared a memorial and forwarded it to the Secretary of State, signed by the high sheriff and other gentlemen. Sir J. Graham at first said he saw no reason to go further than to commute the sentence of death to that of transportation for life. The magistrates, however, feeling that if the woman were innocent, she ought to be set at liberty, again communicated with Sir J. Graham, who thereupon had a conference with Mr. Justice Wightman, the judge at the trial, and the result is, that the woman has received a free pardon, and has set out to rejoin her husband.

Dover.—The result of the inquiry into the "cropping case," which has recently made the prison of this town so notorious, has just been published. The inquiry was conducted by Mr. Russell, inspector of prisons, who examined all parties with great fairness, and at the close of the proceedings addressed a few remarks to Messrs. Fitzjames and Gladstone, expressive of his deep regret that they should have been subjected to what certainly appeared to him an undue und unnecessary rigour on the part of the gaoler. He could not, however, discover from the evidence he had taken, any actual malice towards them on the part of the gaoler; and though he chose to strain, as he certainly did, some of his prison regulations to the utmost, instead of using a prudent discretion in carrying them into practice, yet it might certainly be said he had acted within the letter of his instructions, and was, therefore, probably free from the imputation of guilt. At the same time, he observed that the gentlemen themselves ought to have been aware that singing and uproarious conduct of any kind could not for a moment be tolerated in a prison; and that the gaoler, as far as that was concerned, was perfectly right in checking it. Subsequent to Messrs. Fitzjames and Gladstone leaving the room, Mr. Russell had the gaoler and turnkey before him, animadverting in strong terms upon their past conduct, and cautioning them for the future. He likewise called the attention of the magistrates to the revision of their prison rules.

Harwich.—The Shearwater, Government steam-vessel, which left Granton-pier with part of the Royal suite shortly after the Trident, met with an accident during her passage of a very serious character. Shortly after three on Friday morning, when off between Flamborough-head and Shields, she came into collision with a large collier. Her figure-head, a great portion of the cutwater, the bowsprit, and her paddle-box on the larboard side were carried away. The collier was so much damaged that it was not expected she would reach Shields in safety. The Shearwater, instead of proceeding to Woolwich, was obliged to put into this port. Among the members of the Royal household on board, were the Earl of Liverpool and the Earl of Hardwick. An inquiry has been instituted by the Admiralty into all the circumstances of the case.

Liverpool.—The local papers contain long accounts of the depression which the shipping interest, in common with the other great interests connected with trade, is now suffering. Freights from foreign ports, besides being scarce, are lower than they have ever been known before; while at home freights are not only low, but cargoes with difficulty made up. So scarce, indeed, is employment for shipping, even at rates which will scarcely pay freight and charges, that the number of ships laid up in Liverpool alone is beyond all past experience. In most of the docks there are unemployed vessels, and vessels on sale; but the Brunswick-dock, large as it is, has more than half its space occupied by ships of large tonnage, with brooms (the sign of being on sale) at their mast-heads. The west side is wholly filled with tiers of vessels on sale, and on the adjoining quay all traffic has ceased. It is said that one firm alone has from 10,000 to 12,000 tons of shipping thus laid up.—The papers have for some time noticed that large numbers of people who had emigrated to the United States had returned in the ships from New York. They continue to arrive in considerable numbers. The greatest number brought by one ship, up to last week, was 250 by the Hottinguer; but the packet-ship New York has since arrived with upwards of 300, many of whom would have starved from want of provisions had not the captain supplied them out of the ship's stores. Among the passengers were a party of British sailors who had been some years in the American navy, which they left, they say, lest if hostilities should break out between Great Britain and the United States, they might be brought into conflict with their own countrymen.—On Friday morning the most destructive fire that has occurred here for a quarter of a century broke out in the bonded stores in Paisley Street. Fifteen warehouses, filled with colonial produce, were destroyed; and the loss is said to amount to 250,000*l.*

Norwich.—The following are the details of the performance of Spohr's new oratorio, the success of which we briefly announced in our last. The crowd assembled in front of the hall was so great, that within ten minutes of the opening of the doors, every part of the building was completely filled. Before the performance began, Professor Taylor addressed the audience, and said, in the name of the committee, that they had occasion, for the first time, to regret that the size of the hall was insufficient for the company who wished to be present, and that those who found themselves unpleasantly crowded, if they chose to leave the hall, should receive tickets of admission to either of the subsequent performances they might prefer. It has since been announced, that besides the two thousand persons who filled the hall, five hundred at least could not obtain admission. The first part of the day's performances consisted of several fine specimens of church music, beginning with the chorus from Joshua, "Ye Sons of Israel," one of Handel's most sublime efforts. The great object of expectation was, of course, "The Fall of Babylon," the new oratorio by Spohr. Although the elector of Hesse Cassel refused permission to the illustrious composer to superintend the performance of his work, it fortunately happened that this superintendence was committed to able hands; and Spohr's confidence in his friend, Professor Taylor, was amply justified by the result, for a more perfect performance, and a more enthusiastic reception was never witnessed. At its commencement the scene lies on the banks of the Euphrates, near Babylon. A chorus of Jews are bewailing their captivity, and crying to Jehovah for deliverance. The prophet Daniel joins in their prayers and predicts their approaching restoration. The scene changes to the Persian camp; and, amid the most animated strains of martial music, the soldiers of Cyrus invoke the vengeance of Heaven on the criminal and devoted city. Within the city, a Jewish mother is represented watching and weeping over her sleeping child, doomed to a life of bondage in a strange land. Her husband enters, bringing joyful tidings. Their inspired prophet has seen, in a vision, the redemption of the Hebrew race. In the second act, the scene is laid in the banquet-hall, in the palace of Belshazzar. The Assyrian monarch is feasting amid the magnificence of his court, when the joyous strains are interrupted by the murmurs of the Jewish captives. The King addresses them in terms of anger and contempt; and, by way of insult, commands the rich and sacred vessels, which once adorned the Temple, to be brought before him and employed in their unholy festivities. While he is exulting in fancied power and security, the hand-writing appears on the wall. The revellers fly in terror. The King calls for his soothsayers to explain the prodigy; and, on their confessing their inability, Daniel, the Jewish captive, is called for. While he is speaking, the distant march of the Persians is heard, and a soldier, with breathless haste, announces to Belshazzar that the foe is upon him. Cyrus, by turning the course of the Euphrates, has been enabled to enter the city; the Babylonian empire is destroyed; and the deliverance of the chosen people is celebrated in songs of pious rejoicing. The music was characterised by all the peculiarities of the composer's manner, and is described as the greatest effort of his genius. The performance is admitted to be faultless, and the complete success of the oratorio will no doubt console Spohr for having been deprived of the gratification of witnessing its triumph. On Friday Professor Taylor's version of Handel's *Samson Agonistes* was presented., The first object of the Professor in this new arrangement was to restore, as far as possible, the text of the *Samson Agonistes*, substituting the language of Milton for that of the mere versifier who had converted the magnificent work of the poet into the miserable libretto, which has so long interfered with the success of Handel's music. This could not be completely done; for in many instances it was necessary to retain the inferior words for the sake of the music, from which they could not be separated. The position of scenes and incidents is changed, and those parts which are unworthy of the greatness of the subject are expunged, while their places are occupied by loftier matter; the additions are made from the poetry of Milton as well as from the music of Handel. Several of the most beautiful songs have been selected from Handel's forgotten Italian operas, and the additional choruses have been taken from such of his oratorios as are never performed entire. Some of the additional pieces exist only in manuscript. *Samson*, as thus reconstructed, is a regular, consistent, and interesting drama; and, in every part of it, the union of poetry and music is complete. The performance was one of a most extraordinary character, and will long live in the memories of those who were so fortunate as to witness it. The oratorio was given with an earnestness and expression which appealed irresistibly to the heart. Every feeling had its just developement, whether the pathos of distress, the prayer of faith, the wail of misery and death, the anticipations of celestial happiness, each and all were depicted with a truth and intensity which left nothing to desire. The music and the expression of it were unparalleled in grandeur and sublimity. The personages of the drama were represented by Mr. Hobbs, Mr. Phillips, Mr. Balfe, Mr. Bradbury, Miss Hawes, Madame Caradori Allan, and Miss Rainforth. It is unnecessary to add that the success of Mr. Taylor's attempt was most complete. The whole festival is described by the *Morning Chronicle* as a triumph; the triumph of zeal, energy, and judgment on the part of the conductor—of ready co-operation on the part of the committee—and of astonishing ability on the part of the performers. It has placed the Norwich Festival on a firmer basis than ever, and enabled it to continue, with increased spirit, its inestimable services to the cause of music." From a statement in the *Norwich Mercury*, of the attendance at this festival as compared with that of 1839, it appears that, in 1839, the number of persons in the patron's gallery at all the performances was 852, and in the body of the hall 5,365—total, 6,217; in 1842, the number in the patrons' gallery was 949, and in the body of the hall 6,370—total, 7,319; exhibiting an increase of receipts amounting to nearly 700*l.* above the festival of 1839.

Portsmouth.—On Sunday afternoon the Archduke Frederick of Austria landed at this Dock-yard from the Austrian frigate Bellona, of which His Imperial Highness is in command, and which arrived at Spithead on the previous evening. As the barge which conveyed his Highness to the shore passed the Parade Battery, the guns of the fort fired a Royal salute, and, as soon as it entered the harbour, the men-of-war manned their yards and saluted. The Admiral Superintendent Parker, with the captains and commanders of the different ships in commission here, were at the Queen's Stairs to receive him with a guard of honour. The men who formed this guard were of the Royal Marines, and the majority of them had been in Syria, and were decorated with the Turkish medal. The selection of these men was in compliment to his Highness, who was also engaged with our fleet on the coast of Syria, in command of an Austrian ship of war. Commodore Sir C. Napier accompanied the Prince on shore, having gone on board the frigate in the forenoon.

His Highness, upon landing, was conducted to the Admiral's house, where he remained a short time, and then re-embarked for the purpose of paying a visit to the Lieut.-Governor, Sir H. Pakenham. As the barge repassed the St. Vincent and Victory, these ships manned their yards. His Imperial Highness proceeded to London on Monday by railway, on a visit to Her Majesty. One of the carriages used for the conveyance of the Royal Family was sent down to Gosport by the Directors of the South Western Railway, to convey him to the metropolis. The Bellona will be brought into the harbour, and taken into dock to have some repairs, during the absence of the Archduke.—On Thursday, the imposing ceremony of presenting new colours to the 16th Regiment took place on Southsea-common, in the presence of a large assemblage of persons, who had come from all parts of the county to witness it. They were presented by Lady Pakenham after the observance of the usual forms.

Railways.—The traffic of the principal railway companies for the past week presents the following returns:—Brighton, 4,228*l.*; Manchester and Leeds, 4,884*l.*; Midland Counties, 2,772*l.*; Edinburgh and Glasgow, 3,339*l.*; Great North of England, 1,291*l.*; South-Western, 6,712*l.*; Birmingham, 16,253*l.*; Eastern Counties, 1,058*l.*; Great Western, 13,999*l.*; Birmingham and Derby, 1,503*l.*; Blackwall, 1,042*l.*; York and North Midland, 1,903*l.*; North Midland, 4,862*l.*; Birmingham and Gloucester, 1,881*l.*; Greenwich, 752*l.*; Croydon, 373*l.*; Northern and Eastern, 1,316*l.*—In railway affairs there is little to notice this week, as the autumnal meetings are now over. At the half-yearly meeting of the Ulster Company, the receipts for the half-year, from 1st March to 31st August, were stated at 10,344*l.*, and the expense of working the line 5,531*l.*, (about 50 per cent.,) leaving a balance of 4,817*l.*, out of which a dividend of 9*s.* per share was declared, leaving 88*l.* to be added to the reserve fund. The total amount already expended in the works and providing stock is 314,300*l.*

IRELAND.

Dublin.—There is little in the Dublin papers but the expected struggle between Mr. Hamilton and Mr. Smith for the representation of the University. As Mr. Hamilton comes forward expressly in opposition to the national system of education and the Maynooth grant, some interest has been excited in political circles by the recent charge of the Primate at his annual visitation at Armagh. His Grace, who is well known to be opposed to the national system, informed his clergy that he had received an assurance from Government that the subject of education should be taken into their consideration before the next session of Parliament, and that, in the course of the session, some measure would most likely be introduced to remedy the existing system.—A similar expectation was held out to the clergy of Ossory and Ferns by the Right Rev. Dr. O'Brien in his visitation address.—The weekly meeting of the Repeal Association took place on Monday; the proceedings consisted merely of reports from the repeal missionaries in the provinces; the amount of rent for the week was 53*l.*

SCOTLAND.

Edinburgh.—The following particulars of her Majesty's embarkation will complete our account of the royal progress in Scotland. As we announced last week, the Queen and Prince Albert embarked at Granton Pier on Thursday. Owing to a circular having been issued by the Lord Provost, the public were made fully acquainted with the details respecting the embarkation, and consequently there was no disappointment, as on the occasion of the landing. As early as seven o'clock hundreds were making their way to the vicinity of the pier, and the whole line of road was densely thronged. The royal procession entered the city by Preston-street, shortly before nine. From thence the route was by the South and North Bridges, where barricades were erected to prevent the pressure from the crowd. On her Majesty's passing across High-street to the North Bridge, a salute of 21 guns was fired from the Castle heights, and, as the crowd had greatly increased, the pace of the horses was slackened. The slopes on the side of the Queensferry-road were covered by thousands of persons. At half-past nine the royal carriage arrived at the pier amidst the long-protracted cheers of the multitude congregated in all directions and places that could command even a glimpse of the pier and the Frith. Her Majesty walked down the platform leaning on the Duke of Buccleuch. Prince Albert gave his arm to the Duchess, who accompanied them in the carriage, and they proceeded through the line of Archers amidst the cheers of the people to the vessel. The Earls of Liverpool and Morton, and several of the Royal suite followed. At the foot of the gangway stood Sir Edward Brace, with Captain Bullock and Commander Crouch on his right and left; the other officers of the vessel were stationed on the larboard side of the deck. Lord Adolphus Fitzclarence received her Majesty and the Prince on board, and the Admiral and his officers saluted her Majesty in the usual form, all which was graciously acknowledged. Sir Neil Douglas, Mr. Sheriff Speirs, Sir Philip Durham, and Mr. R. W. Hamilton, were also on deck. The cheering was now deafening, during which her Majesty stood conversing with Admiral Brace and those immediately around. The Queen and Prince Albert were then conducted into the saloon, and in a few minutes afterwards re-appeared on deck, when her Majesty expressed herself highly gratified with the accommodation provided. The band of the Enniskillens repeated the national anthem at this moment. Her Majesty then proceeded to take leave of her noble host and hostess, and other distinguished individuals, cordially shaking the Duke of Buccleuch by the hand, and saluting the Duchess, the Countess of Cawdor, Lady Mary Campbell, and Lady John Scott. The Trident had the Royal standard flying at her main, the Admiralty flag at the fore, and the flag of Admiral Sir E. Brace at the mizen. At half-past nine the Duke and Duchess of Buccleuch, the Earl of Morton, Viscount and Lady Emlyn, Lord Adolphus Fitzclarence, the Earl and Countess of Cawdor, Lord and Lady John Scott, Sir Philip Durham, and others, came on shore. As the vessel was getting under weigh, her Majesty stood for some time on the quarter-deck, no one being immediately around her, and surveyed the scene with a most lively expression of countenance. Every one was delighted, and the whole spectacle was animating and imposing in the extreme. The Prince then joined her Majesty, calling her attention to the seaward prospect; and the Admiral and his officers having taken their respective stations, the vessel got under weigh. The Queen and Prince came close to the starboard quarter, and with much earnestness acknowledged the cheers of the thousands on the pier and in the steamers and other vessels around, who lingered in their places watching the progress of the noble vessel as it advanced down the Frith. The Trident, in passing the sloops of war and the yacht, was received with a Royal salute. As she moved down the Firth, she took the lead of all the other vessels. Nothing could surpass the animating scene. Crafts of every kind were afloat, gaily decorated with flags. The spectacle will long be remembered by the thousands who were present, and is described as the most imposing sight connected with her Majesty's visit to Edinburgh. A day or two before the embarkation, the Lord Provost and a deputation of the corporation presented the freedom of the city to Prince Albert, Sir R. Peel, Lord Aberdeen, and the Duke of Buccleuch. The burgess ticket of the Prince stated that the freedom was presented—"In testimony of the respect entertained by the magistrates and council for the public and private virtues by which his Royal Highness adorns his exalted station." That presented to the Duke of Buccleuch expressed "the sense entertained by the citizens of Edinburgh of the virtues which adorn his high rank—the patriotic improvements he has accomplished—and the manner in which his Grace has discharged the duty of host of her Majesty the Queen on her visit to this metropolis." Those to Sir R. Peel and Lord Aberdeen expressed their sense of the manner in which they had discharged their duty as Ministers of the Crown, in their attendance on her Majesty during her visit to Scotland. Previously to her Majesty's departure, Lord Aberdeen addressed the following letter to the Lord Advocate:—"My Lord—I have received the Queen's commands to signify her Majesty's most gracious approbation of all the arrangements made for her reception, and that of his Royal Highness Prince Albert, in Scotland. I am to request that your lordship will communicate to the sheriffs and magistracy of the different counties through which her Majesty has passed, the sense entertained of the judicious measures adopted by them for the preservation of order and regularity during the progress of her Majesty in this portion of her dominions. The Queen will leave Scotland with a feeling of regret that her visit on the present occasion could not be further prolonged. Her Majesty fully expected to witness the loyalty and attachment of her Scottish subjects; but the devotion and enthusiasm evinced in every quarter, and by all ranks, have produced an impression on the mind of her Majesty which can never be effaced."—It is said that her Majesty and Prince Albert contemplate an annual visit to Scotland, not merely for personal gratification, but for the health of her illustrious children; and that Craigmillar Castle, the property of Mr. L. Glenour of Inch, will be fitted up for her Majesty's accommodation.

Drummond Castle.—The accounts received since our last describe the success of Prince Albert in his sport in Glenartney Forest. It seems that his Royal Highness "stalked" the deer in the ordinary way. He walked admirably and with much spirit. There was no attempt to drive the deer for him. He did not succeed in getting near a herd, and did not obtain what could be termed a good shot once in the day. It is a proof, therefore, of his skill as a marksman, that he killed a stag and two hinds, which were secured, and wounded two or three more, which may probably be recovered. He was attended by Lord Willoughby d'Eresby and Mr. Campbell, of Monzie, whose experience in the sport was of much service to the Prince. Lord Willoughby d'Eresby's forester and his Royal Highness's yager accompanied the party. The Prince was engaged in the forest several hours. His success at Taymouth on the 9th inst. has been already before our readers. It appears that the spoils are to be preserved as relics of the event, and that the Marquis of Breadalbane has forwarded a capercailzie, a blackcock, three red grouse, and three hares, shot by the Prince on the braes of Taymouth, to Edinburgh, to be stuffed. The capercailzie is said to be a remarkably fine specimen of that rare bird.

THEATRICALS.

Haymarket.—A new piece called "Alma Mater, or a School for Coquettes," called a comedy in the bills after the modern fashion, was brought out on Monday with the most extraordinary success. The audience literally roared their applause—they shouted at every fall of the curtain, they shouted when the piece was announced for repetition, and at the close they repeated their shouts for the appearance of the author. Had the piece been one of the highest productions of dramatic genius, the success could not have been more distinguished. Notwithstanding this success, it displayed no inventive power; but, on the contrary, is a resuscitation of characters which have become so familiar to the stage, that every one was an old acquaintance. The plot seemed secondary to the main object of raising a laugh by extravagant incidents and smartness of dialogue, and was consequently of a very meagre character. An uncle has two nephews, the one all study, and the other all idleness; he is also guardian to a widow and her two children, a girl and a boy, with the first of whom both his nephews are in love, while he himself has formerly been in love with, but now hates, the widow. The scene is laid at Oxford. The scamp marries the girl, and the student becomes, according to the comedy, a wrangler. The widow entraps the uncle. An Irish Major in "her Majesty's heavies" philosophises on duelling; a swindler, who makes love both to the widow and her daughter, is discovered before he has accomplished any of his schemes; and a college Dean makes his appearance in a character which no University ever witnessed within the memory of man. There were of course the frolics of under graduates at Oxford, Champagne suppers, hooting the bull-dogs, and brow-beating the Dean! The young lady ill-treats her lover, and bids him make love to her mamma, which he obeys to her great indignation; and the whole concludes with the honour of wrangler being conferred upon a gentleman who was insensible from champagne the night before, and a resolution against matrimony of 20 years' standing being broken in the person of *Sir Samuel Sarcasm* (Mr. Farren) by a single glance from the *Widow Venture*. The proprieties of the piece may be imagined by the wranglership obtained at Oxford, by the matriculation of a three years' man, and by the appearance of the collegian's sister at the student's supper. In this and other respects the piece, in spite of the laughter it provoked, has no heart, and never passes beneath the surface of the society it professes to represent. The manager, however, had brought out the piece with all the appliances of capital scenery; the audience were too much delighted to criticise the means by which they were pleased, and the play was announced for repetition amidst a vehemence of applause which could hardly have been surpassed if the piece had been a work of the very highest class.

Miscellaneous.

The Antarctic Expedition.—The *Guernsey Star* of Sept. 15, contains the following account of this expedition, which may interest our readers:—"The Alarm, Capt. Stewart, left Guernsey last year for the Falkland Islands, and departed from thence at the end of May last for Buenos Ayres. A gentleman of Guernsey having received a letter by her, giving some account of Capt. Ross and the vessels under him, engaged in a scientific voyage of discovery towards the Antarctic Pole, has favoured us with the following extract:—"Capt. Ross and the Antarctic expedition are now here. The Erebus and Terror came in contact, on endeavouring to escape an iceberg, in the seas of the Southern Pole. The expedition will positively be here for five or six months, to repair the vessels and to make observations. Capt. Ross has erected an observatory at the old French fort built by Bougainville. A most interesting series of observations are carrying on, which will greatly interest the scientific world. Those upon the pendulum are noted every quarter of an hour. Astronomical observations are also carefully made by the officers. Thermometers are placed both above the ground and under it; mine, with my barometers, are now doing duty with the rest, and have the honour to be registered also. The anemometers, showing the direction and force of the winds, will add much to the valuable information afforded by Capt. Sullivan, R.N., respecting these islands. Pluviameters are also carefully registered, and we are now about the end of your Guernsey November. A tide-gauge is by the jetty, and an excellent magnetic observatory, where the dip, intensity, and variation of the needle are carefully registered by able observers. The officers relieve each other in regular watches on these duties; and I never met with such devotees of science. You would be delighted to see Capt. Ross's little hammock swinging close to his darling pendulum, and a large hole in the thin partition, that he may see it any moment; and Capt. Crozier's hammock is close alongside of it. The floor of this room is mother earth, from our want of timber. Capt. Ross has been so kind, at my request, as to add to these observations another series, to ascertain the rate of evaporation in these islands; and Hooker, the botanist, is also so good as to draw up a report on the grasses, the prevailing gramineæ being considered as unknown in Europe. The splendid tussack grass is the gold and glory of these islands. It will, I hope, yet make the fortune of Orkney and Irish landowners of peat bogs. Every animal here feeds upon it with avidity, and fattens in a short time. It may be planted and cut like the guinea grass of the West Indies. The blades are about six feet long, and from 200 to 300 shoots spring from one plant. I have proved, by several experiments, that one man can cut 100 bundles in a day; and that a horse will greedily devour five of these in the same time. Indeed, so fond of it are both horses and cows, that they will eat the dry tussack thatch from the roofs of the houses in preference to good grass. About four inches of the root eats like the mountain cabbage. It loves a rank, wet, peat bog, with the sea-spray over it. Indeed, when the sea beats with the greatest violence, and the sea-spray is carried furthest, then the tussack-grass thrives best on the soil it loves. All the smaller islands here, though some of them are as large as Guernsey, are covered with tussack, which is nutritious all the year. The whole of the gentlemen on the expedition are delighted with the Falkland Islands, and express themselves as being more pleased with them than even with New Zealand. Some think them in every way better for colonization, even with the drawback of wanting timber trees there. When the observations made during their voyage are published, you will be surprised at their favourable account of the climate.

In addition to all these scientific observations, the surveying department is exploring and examining different harbours, sites for different objects in a new settlement, &c. The botanist and I started from Port William, where I had been eight days, at seven o'clock in this winter morning, and on foot; arrived at Government House by four o'clock in the afternoon, examining the country we travelled over, where there is a good deal of mossy bog. No one has done this before in one day during the winter, yet the distance as the crow flies is not far. I have tamed a guanacoe from Patagonia. He lies down before the fire, with his head on my knee like a dog, though he is now as tall as a donkey. I hope to get more in the Falkland Islands. They browse on the poorest land, and their flesh is like venison. Their wool is thick, but I fear not so valuable as that of the alpaca. The monkey from the Cape de Verds has hitherto kept his health, and is quite lively. I hope soon to give a favourable account of my adding to our domestic breed of animals the valuable fur seal. In going from Fort Sussex to Mount Osborne I passed several herds of wild cattle. The day was most beautiful, and so clear that I saw from Cape Dolphin to Cape Carysford, all over Berkley Sound. Lively Island appeared at our feet. The potatoes came here in beautiful order by the Alarm, from Guernsey. The onions, I fear, were packed in the sea-sand, as I lost them, and the plants, fruit-trees, &c. The fruit-trees should have been packed in moss, and pressed down in it."

The Aroostook Mountains.—This important tract of country, which has just been ceded to Great Britain, has been examined by some of our eminent geologists. Dr. Jackson, the geologist of Maine, gives an interesting account of his examination of the mountain region of the disputed territory near the Penobscot Forks, which gives a graphic feature of that part of the country, and makes it one of the most sublime and imposing formations. Mountain Katahdin is a lofty precipitous cone of pure granite, whose treeless summit—having no vegetable growth but a few bushes of the mountain cranberry and spicy blueberries—was attained with great labour, by clambering almost perpendicular crags. It was ascertained to be 5,300 feet elevation, the highest in Maine. What is remarkable is, that in this granite formation was found diluvial limestone, with shell impressions, showing the sea had been there; and in the same region limestone with scoriaceous trap melted and imbricated into its seams in an elegant manner; showing, also, that volcanic action had been at work. From one high mountain, the Sugar Loaf Cone, he saw around him no less than 50 lofty peaks, and 17 mountain lakes, cascades of 200 feet fall, &c. Why, this Aroostook country must hereafter be called the Alpine Regions of Maine!—*New York Herald.*

SPORTING.

Doncaster Races.—The particulars of the race for the *Gold Cup* of 300 sovs. on Thursday, of which we gave the results in our last, as received by the express of that morning, present little room for comment. The betting was 7 to 4 on Beeswing, 3 to 1 agst Charles XII., 7 to 1 agst Attila, and 12 to 1 agst The Shadow. The race may be described in two lines. Beeswing took the lead at starting, was never approached within two lengths, and won in the very commonest of canters; The Shadow was second at the stand, where Charles XII. passed her; Attila was several lengths in the rear from the start to the finish.

Friday.—The racing commenced at an early hour, and was brought to a conclusion in time to permit the vistors to reach the trains at Swinton and Masborough. The attendance was unusually large for the last day, and the sport (made the more interesting by the defeat of Blue Bonnet), was excellent. It commenced with—*The Scarborough Stakes* of 30 sovs. each. One mile. (9 Subs.)—Won by Sir C. Monck's Brother to Garland (Lye): beating Mr. Clark's Master Thomas and Mr. Ramshay's Moss Trooper. The favourite made all the running, and won easy by a length. The third was beaten nearly two lengths.

The Park Hill Stakes of 50 sovs. each. The second receives 100*l.* out of the stakes. St. Leger course. (29 Subs).—Won by Colonel Cradock's Sally (Templeman), beating Lord Eglinton's Blue Bonnet, Lord Chesterfield's Dilbar, Lord G. Bentinck's Firebrand, Sir R. Bulkeley's f by Bay Middleton. Betting—The betting open at 2 to 1 on Blue Bonnet; but on her taking her canter before starting it was obvious that she was not "fit," that the field immediately obtained the call at 5 to 4; Sally, who was very much fancied, rising to 6 and 7 to 4: Blue Bonnet, however, came again, and at the close it was 5 to 4 on her, 9 to 4 agst Sally, 5 to 1 agst Dilbar, and 10 to 1 agst each of the others. Sir R. Bulkeley's mare was restive at the post, and caused three false starts; at the fourth attempt she was led up, and they got off well. Firebrand made play at a moderate pace to the Red House, where she gave up, and Blue Bonnet went on with the running, Sally waiting on her; at the distance the latter challenged, got her head in front of the stand, and, after a long set-to, won by a neck. Dilbar was a bad third.

The Innkeepers' Plate of 100*l.*, added to a Sweepstakes of 15 sov. each, 10ft., for all horses but two-yr-olds. Red House in. (12 Subs.)—Won by Mr. H. Stebbing's ch. c. Edmond (G. Francis); beating Mr. F. Walker's Billingham Lass. The following also started, but were not placed:—Mr. Dawson's Our Nell; Sir R. Bulkeley's Cerito; Lord Milton's L'Uccello; Mr. Clark's William le Gros; Mr. Peck's Paragon: Mr. Price's Marion; Lord G. Bentinck's Yorkshire Lady. Billingham Lass made the running to the distance, where Edmond challenged, and, after a fine race, won by a neck. Marion was a good third.

The Town Plate of 100*l.*, the second to receive 48 guineas. Heats, 2 miles.—Won by Mr. Goodman's The Shadow (Rogers); beating General Sharp's Lara, and Captain Harcourt's Arnagill. Betting—5 to 2 on The Shadow, who won both heats in a canter. This was the last race of this well-arranged and successful meeting.

Improvement of the Races.—The committee of the Town Council, consisting of Mr. T. Johnson the Mayor, Sir Isaac Worley, and Councillors Moray and Webb, with Mr. Mason the town clerk, had an interview in the morning with the noblemen and gentlemen of the Doncaster Racing Club, consisting of Lord Chesterfield (in the chair), the Marquis of Normanby, Lord Kelburne, Colonel Peel, Colonel Cradock, Sir W. B. Cooke, &c. On the committee being introduced, Lord Chesterfield rose and expressed the thanks of himself and noblemen and others, supporters of the Doncaster races, for the liberal subscription of 1,000*l.*, guaranteed by the corporation for 1843; and, on behalf of himself and friends, expressed their determination to do everything in their power to render the races as effective and attractive as possible. The noblemen present would take into consideration the means of providing for certain incidental expenses attendant on the races, and thus relieve the corporation from certain payments; but inasmuch as some of the stakes were now subscribed to, many of such expenses could not be provided for altogether prior to the races of 1844. The suggestions of the Town Council were exceedingly proper for the consideration of the gentlemen of the racing club, who would deliberate on them at a future meeting of the club, when more members would be present, and would inform the town clerk of the result. At a subsequent meeting Mr. Clarke was re-appointed judge, and Mr. Martin clerk of the course, and the Earl of Eglinton consented to act as one of the Stewards. It is said to be in contemplation to run the Yorkshire Handicap on Wednesday instead of Monday.

Law.

Cr[illegible]minal C[illegible]rt.—The Sessions for the present quarter commenced on Monday, but the early trials presented little public interest. The Court was occupied on Monday and Tuesday with the trial of *Percival Hamilton Chamberlayne, Geo. Fuller, Jane Sophia Matilda Fuller*, and *William Napier Reeve*, on a charge of conspiring together to convict Thomas Alley Jones of a felony. The prosecutor was, at the last session, tried and acquitted on a charge of stealing a pair of snuffers and tray, and other trifling articles, the property of a bankrupt named Fuller. The evidence was very lengthy, but altogether of mere personal interest, and the case ended on Tuesday night, at twelve o'clock, in the conviction of Percival Hamilton Chamberlayne and George Fuller, and the acquittal of the other prisoners. The sentence was deferred.

Post-office Forgery.—James Samuel Brown, late a clerk in the General Post-office, was indicted for feloniously forging and counterfeiting certain orders for the payment of money. The Attorney-General having stated the nature of the evidence against the prisoner, called the following witnesses: Mrs Blundell deposed that her husband keeps the post-office at Camberwell, and she proved that she paid eight money-orders upon a letter of advice, which purported to come from Sittingbourne in Kent. Robert Poulten deposed that on the 24th of August he drove the prisoner about the town; and, among other places they called at, was the post-office at Camberwell. The prisoner had a cash-box with him, and when he left him he gave him a shilling out of it, and witness then saw that there was a great quantity of gold in the cash-box. The money-orders were then produced, and they were all proved to be forgeries; and they appeared to be in the prisoner's handwriting. On the day the money was obtained it was proved that the prisoner had asked and obtained leave of absence from the Post-office. This was the case for the prosecution. Mr. Phillips addressed the jury, and said he should not attempt to contradict the evidence adduced for the prosecution, and he would at once inform the jury that the defence he was instructed to make was, that the prisoner was of unsound mind, and incapable of distinguishing between right and wrong. He should produce testimony to that effect, and when the jury had heard the facts the witnesses he was about to call would depose to, he had no doubt they would say by their verdict that the prisoner was not accountable for his acts at the time he committed the offence imputed to him. Witnesses were called who proved that about 12 years ago the prisoner received an injury on the head, and since that time his conduct had been very eccentric, and frequently productive of severe personal injury to himself. Dr. Sutherland, Dr. Philip, and Mr. M'Murdo, the surgeon of Newgate, were next examined, and they all expressed their opinion that the prisoner was decidedly of unsound mind. Mr. M'Murdo, on being questioned by Sir F. Pollock, said that he had been thirteen years surgeon to the gaol, and had frequently opportunities of seeing prisoners who simulated insanity, and he was quite sure that was not the case with the prisoner. Mr. Justice Wightman said the question the jury would have to decide was, whether at the time the prisoner committed the offence he was in a condition of mind to distinguish between right and wrong. The medical testimony appeared to be very strong upon the subject. The Attorney-General said he, of course, had no other desire than to perform his duty to the public. A defence of this kind ought to be closely inquired into; but, at the same time, when it was made out satisfactorily, it was clear that a prisoner ought to have the advantage of it, and that he ought not to be convicted of an offence of the commission of which he was unconscious. Mr. Justice Wightman having briefly addressed the jury, they immediately returned a verdict acquitting the prisoner on the ground of insanity, and he was ordered to be detained during her Majesty's pleasure.

MARK LANE, Friday, Sept. 23.—On Monday a large proportion of the supply of English Wheat was left unsold, which has since been disposed of at rather declining prices. Foreign is offering on the terms realised on Monday, but scarcely any transactions have taken place. Two or three Cargoes of Mediterranean Wheat have been sold for exportation. The demand increases for fine Malting Barley beyond the supply, and is improving in value. Peas and Beans are unaltered. Fine English and Foreign Oats are rather dearer, whilst Irish are cheaper.

GAZETTE OF THE WEEK.

INSOLVENT.—H. T. Harrison, Tavistock-row, Covent-garden, hotel keeper.

BANKRUPTS.—E. H. Labatt, Mincing-lane, merchant—J. Bromley, Knottingley, Yorkshire, vessel owner—J. Jenkins, Cardiff, draper—J. Spence, Alford, Lincolnshire, gas manufacturer—H. Adams, Totnes, Devonshire, merchant—G. Olden, Salisbury, grocer—J. E. Beerbohm, and W. E. Slaughter, Fenchurch-street, merchants—W. Chapman and C. M. Woodyer, Wapping, coal merchants—W. Brocksopp, High-street, Southwark, grocer—J. Reid, King William-street, City, chemist and druggist—J. J. Iselin, St. Bennet's-place, Gracechurch-street, merchant—J. Thompson, Oxford-street, London, dealer in paper hangings—W. H. Parkes, Birmingham, hosier—S. Chew, Clipston, Northamptonshire, flour and malt dealer.

SCOTCH SEQUESTRATIONS.—J. Lunn, Edinburgh, builder—J. Robertson and Co., Alva, manufacturers—P. Robertson, Edinburgh, tailor—J. Thomson, Annan, draper—G. Wauchope, Edinburgh, ivory turner.

BIRTHS.—On the 20th inst., at Cheltenham, the lady of Pio Cianchettini, the composer, of a son—On the 13th inst., at Carrigaholt Castle, county Clare, the lady of H. S. Burton, Esq., of a son—On the 20th inst., at No. 3, Lower Eccleston-street, the lady of W. G. Rose, Esq., of a son—On the 16th inst., the lady of G. Worth, Esq., Montagu-street, Portman-square, of a son—On the 18th inst., at Edinburgh, the lady of Major Black, 53rd Regiment, of a daughter—On the 5th inst., at Florence, the lady of J. N. Tyndale, Esq., of Blandford-square, London, of a son—On the 13th inst., at Paris, the lady of G. Graham, Esq., of Drynie, of a son—On the 20th inst., the wife of J. Shephard, Esq., of a son—On the 16th inst., Mrs. John J. Osborn, 25, Ely-place, of a son—On the 21st inst., at Hadley, Middlesex, the wife of the Rev. T. H. Winbolt, of a daughter.

MARRIED.—On the 21st inst., at Paddington Old Church, P. Burrowes, Esq., surgeon, second son of the late T. F. Burrowes, Esq., of Demerara, to Amelia Seymour, eldest daughter of F. Alven, Esq., of 32, Great Ormond-street, Queen-square—On the 21st inst., at St. Nicholas Church, Brighton, T. G. Vernon, Esq., of Tewkesbury, to Euphemia Harriet, second daughter of Sir R. Graham, Bart., of Esk, Cumberland—On the 20th inst., at St. George's, Hanover-square, Capt. Egerton Leigh, of the Queen's Dragoons, to Lydia, daughter of J. S. Wright, Esq., of Rempstone Hall, Notts—On the 20th inst., at St. Matthew's, Brixton, J. R. Barrett, of Copthall-court, Esq., to Sarah Ann, eldest daughter of George G. Barton, of Raleigh-lodge, Brixton-hill, Esq.—On the 22d inst., at North Cray Church, William, third son of J. Angerstein, Esq., to Mary Ann, only child of the late W. Nettleship, Esq.

DIED.—On the 18th inst., at Ealing, Sophia Amelia, the wife of Wm. T. Rogers, Esq., aged 32—Lately, at Boulogne, Sir W. Ouseley, brother to Sir G. Ouseley, Bart., and son of R. Ouseley, Esq., of Limerick—On the 1st of July, at sea, on board the Scotia, the Rev. Jas. J. Tucker, Chaplain on the Bengal Establishment—On the 17th inst., at her residence, Gosmore, near Hitchin, aged 80, Harriet, youngest daughter of the late Rev. T. Dove—On the 19th inst., at 30, Duke-street, St. James's, Capt. E. R. Sibly, R.N.—On the 17th inst., in Great Cumberland-street, Lady Ormsby Rebow, wife of J. G. Rebow, Esq., and only child of General Slater Rebow, of Wivenhoe-park, Essex, aged 38—On the 18th of July, at Rio de Janeiro, David Stevenson, Esq.—On the 19th inst., at Fell Heill, near Ripley, Surrey, Caroline Easter, wife of J. A. Thrupp, Esq., of Spanish-place.

TO FLORISTS AND GARDENERS.

TO BE LET on LEASE, a small NURSERY, of about half an acre of Land, with Dwelling-house, Greenhouse, and Hothouse, for 63 Years. Rent 28*l.* a year. Stock to be taken at valuation, which will be about 60*l.* For further particulars, inquire of W. Cox, Florist, Lark-hall Lane, South Lambeth.

UPWARDS of 160,000 WHITETHORN QUICK for sale at Manor Cottage, near the Almshouses, Lee, Kent. It is of two, three, and four years' growth. The price will be very moderate, particularly to any person who could take the lot. Inquire for the Gardener.

TO FLORISTS, NURSERYMEN, and OTHERS.—To be Let on Lease, a very desirable walled-in Garden, with Cottage, Greenhouses, large ranges of Brick Pits, &c. Rent low, and nothing of the kind in the neighbourhood; the Stock, Glass, &c., to be taken at a fair valuation. For particulars apply on the premises, Chester Gardens, near Chester-street, Kennington Cross.

HODGSON and ABBOTT'S PALE ALE.—The above celebrated Beer, so strongly recommended by the Faculty, is to be procured only from E. Abbott, Brewery, Bow, Middlesex. The Trade not being supplied, the Pale Ale cannot be genuine if procured elsewhere.

City Office, 98, Gracechurch-street.

NEW ZEALAND COMPANY.—NOTICE IS HEREBY GIVEN, that the BOOKS for TRANSFER of STOCK in this Company will be closed on Saturday the 1st Day of October next, and will be reopened on Tuesday the 11th Day of October. By order, John Ward, Secretary.

New Zealand House, Broad-street Buildings,
22d September, 1842.

NEW ZEALAND COMPANY.—NOTICE IS HEREBY GIVEN, that a SPECIAL GENERAL COURT of PROPRIETORS of the NEW ZEALAND COMPANY will be holden on Monday the 10th day of October next, at One o'clock precisely, at this House, to consider of a DIVIDEND on the Company's stock. By order, John Ward, Secretary.

New Zealand House, Broad-street Buildings,
22d September, 1842.

SHIPS FOR NEW ZEALAND, under Charter to the New Zealand Company, to sail as under mentioned, viz.—

FOR NELSON AND WELLINGTON:
INDUS, A 1, 425 tons, from London, 1st October.
FOR WELLINGTON AND NELSON.
PHŒBE, 471 Tons, from London, 15th November.

For further particulars apply at the New Zealand House, Broad-street Buildings.

EMIGRATION to NEW ZEALAND. IMPORTANT TO FARMERS AND SMALL CAPITALISTS.

THE COURT of DIRECTORS of the NEW ZEALAND COMPANY having received numerous applications for passages from persons of the above description, and being desirous of facilitating the emigration to New Zealand of persons of the Labouring Class, of good character, but who do not fall within the regulations entitling them to a Free Passage; and also of Small Capitalists, to whom the costly accommodation usually provided for Cabin Passengers would be unsuitable: Notice is hereby given that Cabin Passages to Wellington and Nelson may be obtained in a First-class Ship chartered by the Company, to sail from the port of London positively on the 15th of November next, on the following terms:—

The price of a Chief Cabin passage, with a liberal dietary, will be Fifty Guineas for a married couple, and Thirty Guineas for a single adult person; and that of a Fore Cabin passage will be Twenty Pounds per adult. The prices for children will be in the proportions fixed by the Passengers' Act, or as the Directors may fix, in the case of large families.

Families who may desire it, may have extra space for their accommodation, upon payment of a proportionate additional sum. One ton freight will be allowed to Chief Cabin, and half a ton to Fore Cabin Passengers, free of charge; extra freight will be allowed by the Directors in their discretion, at the rate of 45*s.* per ton measurement, and 25*s.* per ton dead weight.

The Company will appoint an experienced Surgeon, and will provide medicines and medical comforts.

Applications for Passage or Freight to be addressed to the Secretary of the New Zealand Company, Broad-street Buildings, London, on or before Saturday, the 15th of October next.

A Deposit of 10*l.* will be required for every Chief Cabin Passage, and of 5*l.* for every Fore Cabin Passage, which must be paid to the Company on or before the 15th of October, and the remainder of the Passage Moneys previously to embarkation.

By order of the Court, John Ward, Secretary.

New Zealand House, Broad-street Buildings,
14th September, 1842.

COPY of a Communication addressed to Messrs. Rowland and Son, No. 20, Hatton Garden, London:—

Gentlemen,—Being called upon to attend a Lady who had had a complaint in her head about a year before, and in consequence had lost nearly all her hair; I found very few hairs remaining, and those just like down, with no appearance of any fresh roots. She stated her desire to use your Macassar Oil, but I felt I could not conscientiously recommend anything for its recovery, as I considered it too far gone. She however determined to try one bottle, which was used in about a month, and then sent to my shop for another, stating her hair to be much improved; she has now used eight bottles in as many months, during which time I have frequently pointed it, and have now the pleasure to inform you that it is quite thick and long; and she is so much pleased with the change, that she says the expense is nothing, and she will never be without it. If you think this statement of facts worth publishing, you are at liberty to do so; and I remain, yours respectfully, John Lickley, Hair-cutter.

Middle-street, Ripon, April 19, 1842.

*** On purchasing, ask for "ROWLAND'S MACASSAR OIL."

MECHI'S EASY SHAVING RAZORS, No. 4, Leadenhall-street, London.—Exchanged if not approved, 3*s.* 6*d.* and 5*s.* each. Naples Soap, Windsor Soap; Shaving, Tooth, Hair, and Nail Brushes; Strops, Paste, Combs, Soap-boxes; Wood, Leather, and Japan Dressing-cases; Desks, Work-boxes, and Tea-Caddies; Trays, Bagatelle, Backgammon, and Chess boards.

Printed by Messrs. Bradbury and Evans, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the Office, 3, Charles-street, Covent Garden, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, September 24, 1842.

MARTIN'S "SPLENDID" *v.* TWITCHETT'S "DON JOHN."—Much has been said and written about my Scarlet Bizarre "Splendid" and Twitchett's "Don John"—sufficient too, I think, without any more epistolary or other controversy.

I am very desirous Mr. Twitchett should at once come to a definite decision as to what steps he intends taking with regard to my challenge. If he does not accept my terms proposed, I shall hereafter consider his apparent certainty of winning entirely defeated, and that he would rather talk or write about his "Don John" being the best Scarlet Bizarre in England, than practically compete for a test of its merits.

Northampton, Sept. 21, 1842. J. MARTIN.

WOOD'S SUPERB SCARLET PHLOX DRUMMONDI.—The colour of this most beautiful of Annuals is a dazzling scarlet; the Flowers are perfectly round, without any space between the petals, forming, unexceptionably, the most brilliant and striking object that can possibly be imagined. J. Wood having grown no other sort, it is impossible that it can be deteriorated by impregnation. Packets, containing 12 seeds, 2*s.* 6*d.* each, postage included.

Nursery, Huntingdon.

N.B.—The above may also be had of Messrs. Warner and Warner, Cornhill, who saw it in bloom.

MESSRS. B. ELY AND SON, FLORISTS, &c., Rothwell Haigh, near Leeds, Yorkshire, beg to inform the Nobility, Florists, and the Public in general, that they will send out this Autumn the following CARNATIONS AND PICOTEES, with which they have won Prizes at most of the principal Exhibitions in Yorkshire in 1841 and 1842:—

				s.	*d.*
Ely's Hugo Meynell, Pink Bizarre,				10	0
Do.	Wm. Beckett, Scarlet Flake,			10	0
Do.	Prince of Wales,	do.		10	0
Do.	Leviathan, Purple Flake,			10	0
Do.	George Lane Fox, Scarlet Picotee, Light Edge,			7	6
Do.	Mrs. Wilson,	do.	do.	5	0
Do.	Mrs. Bossville,	do.	do.	5	0
Do.	Mrs. Meynell, Scarlet Picotee, Heavy Edge,			7	6
Do.	Emperor,	do.	do.	5	0
Do.	Empress, Purple Picotee, Light Edge,			5	0
Do.	Mrs. Ramsden, do.		do.	5	0
Do.	Field Marshal, do.	Heavy Edge,		10	0
Do.	Marchioness of Waterford, Rose Picotee,			5	0
Do.	Ada,		do.	5	0
Do.	Mrs. Bland,		do.	5	0

N. B.—Ely & Son have also an extensive collection of Carnations and Picotees, consisting of upwards of 2,500 pots, including most of the principal varieties grown, Catalogues of which may be had by post on application.

PELARGONIUM—LYNE'S SUNRISE.—This valuable and first-rate variety, which has far surpassed "Rising Sun," or any flower of the kind ever produced, can be ordered of *Mr. Wm. Rendle, Union-road Nursery, Plymouth;* or of his London Agents—Messrs. Warner, Seedsmen, Cornhill, and Mr. Wm. Bristow, Seedsman, Knightsbridge, from whom Engravings and Descriptions can be obtained. The Stock being very limited, it is desired that orders will be immediately forwarded, as Mr. Rendle will not guarantee to supply strong Plants without this is attended to. Lyne's Duke of Cornwall, which is styled by the Editor of the *Chronicle* as "*a Flower of extraordinary brilliancy of colour,*" with Lyne's Lord Ebrington, Lyne's Princess Royal, Cynthia, Hamlet, and Basset's Glory of the West, can also be obtained on application as above.

Union-road Nursery, Plymouth, Sept. 10, 1842.

TWITCHETT'S DON JOHN CARNATION (the finest Scarlet Bizarre in England); HEADLY'S SARAH, a splendid light-edged Red Picotee—each One Guinea per pair. See Wakeling's "Florist's Guide" for Sept. 1841 and June 1842. Also TWITCHETT'S FAIR ROSAMOND, a rich rose-edged Picotee on a snow-white ground, 10*s.* 6*d.* per pair. The Trade allowance if six pairs be ordered. Address Mr. Twitchett, Cambridge, or Messrs. Dickson, Florists, Acre-lane, Brixton, London.

Mr. Twitchett will show 21 blooms of his Don John against the like number of Martin's Splendid, or any other Scarlet Bizarre, for Two Guineas each bloom, and Twenty Guineas the odds, July 1843, p. p.

THE FINEST VARIETIES OF HYACINTHS, IRISES, AND ANEMONES, AT VERY MODERATE PRICES.

JOHN SUTTON and SONS, importing largely of Irises, Hyacinths, Anemones, Tulips, &c., which are selected annually while in bloom in Holland, are enabled to supply such sorts as are most worthy of cultivation, and at very low prices. The following are particularly recommended:—

The finest Hyacinths known, per dozen	£0	15	0
Very fine ditto, per dozen	0	7	6
Ditto ditto Mixed Double, per 100	1	1	0
Superb New Irises, best 30 varieties by name	1	1	0
Ditto ditto ditto Mixed, per 100	1	5	0
The New Large Double Anemones, by name, per 100	3	10	0
The same Varieties, mixed, per 100	1	1	0
Early Single, many colours, per 100	0	7	0

Gladiolus, Ranunculus, Ixias, Tulips, Crocuses, Jonquils, Narcissus, &c., &c., in extensive collections, at low prices, as per Catalogue. N.B.—Goods delivered, free of carriage, to the Railway Stations and Coach Offices in London.

Reading Nursery, Sept. 15.

FUCHSIA ST. CLARE.

THE above magnificent FUCHSIA was raised by Mr. Meehan, Gardener to Col. Harcourt, at St. Clare, Isle of Wight, from whom Messrs. YOUELL obtained the entire stock. In May last it was submitted to Dr. Lindley for his opinion, which will be found in the *Gardeners' Chronicle* of the 14th of that month as follows:—

"Your Seedling Fuchsia is by far the finest hybrid we have seen; the flower being three inches in length, with the tube and sepals of a bright carmine colour, and the petals of a rosy purple. If, as you say, it is a strong grower and a free bloomer, it will prove a valuable addition to this beautiful genus."

Messrs. Youell, in bringing this beautiful production into public notice, do so without the slightest diffidence, being fully assured of its giving the most entire satisfaction. It is of vigorous habit, fine foliage, and, as a proof of its being a most profuse bloomer, they have a plant in flower at the present time on one branch of which there are upwards of 200 blooms, forming a splendid object for the Greenhouse, Conservatory, or Flower-garden.

Youell & Co. purpose sending it out in the second week of April next, at 10*s.* 6*d.* per plant, free of postage, to any part of the United Kingdom; and all orders they may be favoured with will be executed in rotation.

Orders from the Continent will receive every care in packing, so as to ensure their safety.

The usual discount to the Trade, where not less than 6 plants are ordered.—Great Yarmouth Nursery, Sept. 15, 1842.

EPACRIS COCCINEA.

HUGH LOW and CO. beg to apprise those friends who have favoured them with orders for the above splendid plant, that they have now ready for delivery small plants at 3*l.* 3*s.* each to the Trade. Owing to the time which has elapsed since many gave their orders, they take the present opportunity of stating that if any one should feel disposed to cancel them, they are at liberty to do so before Monday the 10th inst., on which day they intend to execute all orders as far as the Plants go.—Clapton Nursery, Sept. 30, 1842.

CINERARIA WEBBERIANA.—J. WEBBER begs to intimate that he is now sending out plants of the above much-admired Blue CINERARIA, figured in "Paxton's Magazine of Botany" for July, at 10*s.* 6*d* per plant, with the usual allowance to the trade. He can also supply Lisianthus Russelianus, at 50*s.* and 75*s.* per 100.—Merriott Nurseries, near Crewkerne, Somersetshire. Sept. 28, 1842.

CAMELLIAS.

CHANDLER and SONS, Nurserymen, Vauxhall, London, beg to state that they have young healthy plants of Camellia nitida now ready to send out at 3*l.* 3*s.* each. This is an imported variety, the flowers of a rose colour, with a white streak through each petal, and very double and compact.

C. and Sons can also supply good plants of C. Albertus at 1*l.* 1*s.* each; also fine healthy young plants of the following sorts, in collections of 1 dozen, viz.:—

Double White, Double Striped, Pompone, Pæoniaflora, Press's Eclipse, Fimbriata, speciosa, splendens, Chandlerii, Colvillii, Hume's Blush, florida—for 2*l.*, package included.

Elegans, Althæiflora, Corallina, eximia, imbricata, coronata, Spofforthiana, Woodsii, Rossii, miniata, Haylockii, Fordii—for 3*l.*, package included.

Bealeii, tricolor, Donkelaerii, serratifolia, regalis, triumphans, albicans, imbricata alba, Francofurtensis, rosea, elata, Colvillii striata—for 4*l.*, package included.

If individual sorts are selected from the above, the price of plants from the first collection will be 3*s.* 6*d.* each; from the second, 5*s.* each; and from the third, 7*s.* 6*d.* each.—A remittance or reference for payment in London will be expected from unknown correspondents.

TWO SPLENDID NEW PURPLE PICOTEES.

WOOD'S LORD HINCHINBROOK, a superb Flower of large size, marking perfect, ground colour of the most snowy whiteness, petals large, and of a beautiful shape, forming a most excellent show flower.

WOOD'S LADY ST. JOHN, a beautiful light-edged Flower, of most superb form and petal, possessing, in short, all the requisites of a first-rate show flower.

J. WOOD, Florist, &c., Huntingdon, begs to announce that the above Picotees, which elicited the admiration of numbers of Florists who saw them in bloom, are now ready for sending out, and can be forwarded by post to any part of the United Kingdom. Price 15*s.* per pair, postage and package included. J. W.'s Catalogue of Carnations, Picotees, &c., for the present season, may be had on application, by inclosing a postage stamp.

N.B.—A remittance or reference expected from unknown correspondents.

NORTH WARNBOROUGH & HARTLEY-ROW NURSERIES, NEAR ODIHAM, HANTS.

JOHN SHILLING begs to return his most sincere Thanks for the very liberal encouragement he has received for these many years past, and to announce that his Sons, JOSEPH and STEPHEN SHILLING, having been brought up to the Business, are competent to carry it on, to its fullest extent; he therefore has resigned the Nursery and Seed Business to them, being assured that they will conduct it properly, and use their utmost endeavours to please; and he most earnestly begs that the favours which have hitherto been so long conferred on him may be extended to his Sons. J. Shilling begs further to add, that, having relinquished the Nursery and Seed Business, he will be enabled to devote more of his time to that of Laying out Grounds, which it is his intention more fully to attend to; and his having given general satisfaction in this department, enables him, if required, to refer to many Noblemen and Gentlemen, who have employed him in very considerable alterations and improvements, and who were well pleased with his ideas and practical knowledge. On application, J. S. is ready to wait on Gentlemen as usual, on the most reasonable terms. Where required, good Foremen can be supplied.

NORTH WARNBOROUGH & HARTLEY-ROW NURSERIES, NEAR ODIHAM, HANTS.

TO the Nobility, Gentry, and Public generally.—JOSEPH and STEPHEN SHILLING, having taken to the Nursery and Seed Business of their Father, beg to solicit a continuance of the favours so many years conferred on him, and to invite their attention and confidence. They beg further to say, that their Nurseries are very extensive, and well stocked with Fruit-trees of the choicest kinds, and true to their sorts. Forest Trees, Coppice Plants, Larch and other Firs, Ornamental Trees for Parks, Flowering Shrubs and Evergreens, Standard and Dwarf Roses, Herbaceous and Greenhouse Plants of all kinds, of which separate catalogues are given; Kitchen-Garden and Flower Seeds, Dutch and English Bulbs, Garden Mats, Mushroom Spawn, Fine Grasses for Lawns and Pastures, with every other article, of the best quality, and at the lowest current price. Grounds laid out. Good Gardeners and Foremen supplied.

FULLER'S SPLENDID PELARGONIUM, MADEMOISELLE RACHEL, is now ready for Delivery at Two Guineas each. For particulars, see Advertisement in the *Gardeners' Chronicle*, Sept. 3d.

Orders received in London by Marnock and Manley, Hackney; Henderson, Pine Apple Place; and Harrison, Downham Market, Norfolk. — Floricultural Grounds, Park Crescent, Worthing, Sussex.

WILLIAM IVERY, Rye-lane, Peckham, begs to inform his Friends and the Public that he can again supply strong plants of the following Cinerarias: Royal Blue, Rival Ring, Imperial Blue, Grandissima, Queen Victoria, Corminius, Splendida, and Greenii, at 2*s.* 6*d.* each. Also strong Bulbs of Tropæolum Jarratti, 30*s.* per doz., or 3*s.* 6*d.* each; tricolorum, 20*s.* per doz., or 2*s.* 6*d.* each; Achimenes longiflora and rosea, 2*s.* 6*d.* each.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WILLIAM WOOD & SON beg leave to inform their numerous Patrons, and Rose Amateurs in general, that their NEW CATALOGUE OF ROSES, for the present season, is now ready for distribution, and will be sent, GRATIS, on application.

The immense Stock of Roses at Maresfield are this season finer and more luxuriant than ever; no pains or expense have been spared to render the collection as rich and unique as possible.

The General Catalogue of Nursery Stock and Trade List of Roses, &c., are also ready for distribution.—Sept. 21st.

CARNATIONS, PICOTEES, AND PINKS.—NATHANIEL NORMAN, Florist, begs to call the attention of the Nobility, Gentry, Amateurs, and his friends generally, to his select Collection, comprising the finest show varieties, with which he has gained twenty prizes this season at the following Societies: London Horticultural, Royal South London, South Essex, and Floricultural Society of London. Has 10,000 Plants now ready, in fine healthy condition.

Catalogues may be had on prepaid application.—Bull Fields, Woolwich.

HYACINTHS, TULIPS, &c.—H. GROOM, Clapham Rise, near London (removed from Walworth), by appointment Florist to her Majesty, respectfully informs the Nobility and Gentry that he has received his Collection of Dutch Roots in excellent condition, and that his Catalogue of Bulbs is ready, and may be had on application.

MYATT'S BRITISH QUEEN STRAWBERRY, after two years' competition, still maintains its pre-eminence; and, in returning thanks to their numerous patrons and friends, J. and W. Myatt beg to say they can with confidence recommend it as the most superb fruit yet known.

Also their new Seedling Strawberry Prince Albert, which for productiveness and size cannot be equalled. Price per 100, each, 50*s.*; and their Eliza, 20*s.* Runners are now ready, and may be had on application to them at Manor Farm, Deptford.

Myatt's famed Victoria Rhubarb, 50*s.* per 100 sets, or 1*s.* 6*d.* per root, will be ready in October.

TO GROWERS OF HYACINTHS, AND OTHER DUTCH BULBS.

MESSRS. YOUELL have much pleasure in announcing that they have just received their importation of the above direct from Haarlem, the Bulbs being remarkably large and sound. For particulars see their advertisement in the *Gardeners' Chronicle* of 27th August.

Catalogues may be had on application.

Great Yarmouth Nursery, Sept. 1st, 1842.

CARNATIONS AND PICOTEES.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

YOUELL & CO.'s Superb Collection of the above will be found to contain every attainable variety worthy of cultivation; and having spared no expense in rendering their Collection the most extensive and select in the kingdom, they beg to announce that they purpose commencing to execute orders the first week in October, upon the following terms:—

25 pairs of extra fine first-rate Show flowers,				£5	0	0
12 ,,	do.	do.	do.	2	10	0
25 ,,	of fine Show flowers,			3	0	0
12 ,,	do.	do.		1	10	0
25 ,,	of extra fine Show Pinks,			1	4	0
12 ,,	do.	do.		0	12	0

The selection being left to Y. & Co.

They beg further to state that, having a peculiar mode of packing the above plants, so as to insure their safe delivery in any part of the United Kingdom per Post, for the information of parties at a distance, wishing to avoid the expense of Carriage, Package, &c., they will send them free of postage, at the extra charge of 2*s.* per doz. pair.

A Post-office order, or reference, is respectfully requested from unknown correspondents.

Catalogues may be had on application, by enclosing two postage stamps.

NEW SUPERB FUCHSIAS.

Youell & Co. beg respectfully to state, that they continue sending out, per Post (free), their Superb Collection of Fuchsias, at the rate of 21*s.* per doz.

Great Yarmouth Nursery, Sept. 8, 1842.

TO GENTLEMEN, NURSERYMEN, and others.—LAVENDER-HILL NURSERY, WANDSWORTH-ROAD.—Mr. GEO. HAINES will sell by Auction, by order of Mr. William Pamplin, in consequence of part of his Nursery Ground being required for other purposes, on MONDAY, Oct. 10th, and two following days, at eleven o'clock, the Nursery Stock, which is particularly adapted for persons engaged in planting, comprising large Evergreens, Fruit and Forest Trees, and Flowering Shrubs; Fine-grown Laurustinus, Laurels, Arbutuses, Evergreen Oaks, Phillyreas, Aucubas, Cedars of Lebanon, Hollies, Rhododendrons, Spruce Firs, and other Shrubs; choice Standard and Dwarf Peaches, Nectarines and Apricots, Mulberries, Figs, Vines, Ivy, Box Edging, large Aloe in tub, and a general assortment of young Nursery Stock. May be viewed three days previous to the sale. Catalogues to be had on the premises; at Messrs. Menier and Co.'s, 63, Strand; Messrs. Sheppard's, 99, New Bond-street; at the Office of *The Gardeners' Chronicle;* and at Mr. Haines's Offices, Knightsbridge, and at Pimlico.

TO MARKET-GARDENERS, NURSERYMEN, AND OTHERS.

PROTHEROE and MORRIS are instructed by the Trustees of Messrs. Adamson and Son, of Stoke Newington, to submit to public competition, on the premises, Wells-street, Hackney, on Monday, Oct. 3, 1842, at 11 o'clock precisely, the whole of the VALUABLE STOCK, consisting of about 800 Hand-glasses, 70 Three-light Boxes and Lights, the whole of which are in excellent condition, Horses and Cart, a quantity of fine Rhubarb for forcing, and sundry Utensils. May be viewed two days prior to Sale. Catalogues may be had on the premises, of the principal Seedsmen, aad of the Auctioneers, American Nursery, Leytonstone.

WESTBURTON, between Arundel and Petworth, Sussex. PINE PLANTS, Live and Dead Farming Stock, and a Life Interest in 803*l.* 5*s.* 6*d.* Consols.—To be Sold by Auction, by Mr. H. Salter (on the premises), by order of the Assignees of James Bisshopp, a Bankrupt, on Tuesday, the 18th of October, 1842, at Eleven o'Clock. The PINES consist of about 4,000 Fruiting and Succession Plants of the very best quality. The PINES produced from this Pinery have always been celebrated for their Growth and Quality, and have obtained the highest prices in the London Markets; and as a further proof of their excellency, they have constantly carried the first Prize at the Shows in London, where they have been brought into Competition with all England. Together with about Three Thousand Flower and Pine Pots.—The Farming Stock consists of 5 capital Cart-Horses, a grey Pony, 43 two-tooth Wether Sheep, 8 fat Pigs, and a quantity of excellent Poultry. A four-horse power portable Thrashing Machine, 2 narrow-wheeled Waggons, Dung-Carts, Corn-Cracker, Chaff-Cutter, 2 Ploughs, Drag-Rakes, Cyder-Press, Cloths, and other Effects. The Life Interest, of James Bisshopp, aged about 53 years, in the sum of 803*l.* 5*s.* 6*d.* 3 per Cent. Consols, standing in the names of Trustees, and producing an Annual Income of 24*l.* 1*s.* 10*d.*, will be offered precisely at Three o'Clock.

Catalogues will be ready 14 days previous to the Sale, and may be obtained on the premises; at Mason's Printing Office, High-street, Steyning; at Mr. Dulley's, fruiterer, Covent Garden; and at the office of the Auctioneer, Arundel. The Pine Plants and Farming Stock may be viewed the day previous to the Sale, and Particulars of the Life Interest may be obtained on application to Messrs. Ellis and Upton, Solicitors, Petworth.

TO GENTLEMEN, FLORISTS, NURSERY AND SEEDSMEN, AND OTHERS.

THE Genuine STOCK IN TRADE of Mr. Lynn, Nursery and Seedsman, Bell-street, Henley, and Vines Hill, Remenham, together with the occupation of the Nursery Ground, till Lady-day, 1845, will be offered for absolute Sale by Auction, by James Champion, on Thursday, 6th October, 1842, and following day, at 11 o'clock precisely each day, as the Lots are numerous. The Sale will commence at the Shop in Bell-street, near the Obelisk, with the Stock of Garden and Flower Seeds, and Bulbs of the most approved kinds (warranted as described), Shop Fixtures, viz., Counter, Desk, 4 nests of Drawers, Seed-Boxes, Shelves and Fittings, Weights and Scales; Corn and Seed Measures, from a bushel to a pint; Clever Pony, Cart and Harness, Saddle, Bridle, Wheel, Hand and Box Barrows, Truck, Tub, and Box; Six Store Pigs, Pig Troughs, Hurdles, Glass Bottles and Baskets, Half-tester Bedstead, and other Furniture; 5 Sacks of Walnut-leaf Kidney and Early-frame Potatoes, &c., &c.

The Stock and Property at Vines Hill Nursery (entrance at the foot of Remenham Hill) comprise 48 Hand Lights, 3, 2, and 1 Light Melon Frames, 8 and 5-light Pits and Sashes, 2 small Greenhouses recently erected; Hot Water Pipes, Saddle, Boiler, and Furnace; a 45 ft. Shed, slate roof, sashes, and partitions; good assortment of named Standard and Trained Fruit and Forest Trees, Hedges and Rows of Arbor Vitæ, Laurels, Red Cedars, Laurustinus, Firs, Irish Ivy, Box, Holly, Yew, Whitethorns, Privet, Phillyreas, Arbutus, Tulip, Pyrus Japonica, Roses; Dutch Honeysuckles, Trumpet do., Lonicera flexuosa, Dahlias, American Plants, Althæas, Sweet Bays, Aucuba, and Yellow Jasmines, Virginian Creepers, Spiræa bella, Syringa grandiflora, Blooming Camellias, and many other scarce plants; quantity of Pelargoniums, Cactuses, Myrtles, Verbenas, Fuchsias, and many others; Box and Thrift Edgings; Gooseberry, Currant, and Raspberry Bushes; Asparagus and Sea-Kale Plants; Rhubarb, Strawberry, and other Plants; large quantity of good Manure, Road Stones, 2000 Flower Pots, &c. &c. Five weeks will be allowed to clear the lots.

May be viewed three days previous to the Sale, and Catalogues Sixpence each (without which no one will be admitted, returnable to Purchasers), may be had on the Premises in Bell-street, and Printing Offices, Henley and Wallingford; the "Gardener's Gazette" Office, 343, Strand; White Hart, Slough, Maidenhead, Reading, Dorchester, and Wycombe; Crown, Marlow and Benson; Journal Office, Oxford; and of the Auctioneer, Nettlebed.

THE CONICAL HOT-WATER BOILERS invented by J. Rogers, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. Shewen having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. Bailey having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. Bailey also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. Bailey were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. Bailey have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their Manufactory.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respectfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths, may be seen in use at his house upon application to the gardener.

HEATING BY HOT WATER.

JOHN WALKER, 46, St. John's Square, Clerkenwell, London, having been for many years extensively engaged in Warming Churches, Manufactories, Hospitals, Hothouses, Conservatories, and Private Houses, by means of Hot Water, either in Pipes or Pedestals, can confidently recommend this mode of heating in preference to any other. Numerous references can be given both in town and country, where he has successfully and satisfactorily applied it. Baths fitted up and heated in a superior manner. Orders executed in all parts of the Country with punctuality and despatch.

Hilditch, 343, Strand, in October; sold by all Booksellers in town and country. Advertisements for the Cover received till the 7th Oct., and Flowers submitted free, until that time, will be included.

In a few days will be published,

A HISTORY of BRITISH FOREST-TREES, indigenous and introduced. By Prideaux John Selby, F.L.S., M.W.S., &c.—This volume describes the various Forest-trees at present grown in Great Britain, and gives an account of their useful and ornamental properties, as well as of the best modes for their culture. It forms a manual for the planter, and an interesting and informing volume for the general reader. Each species is historically described, and figured. The Engravings, amounting to nearly 200, represent the perfect tree, and details of the flowers, leaves, and fruit, Demy 8vo., 28*s.* Royal 8vo. 2*l.* 16*s.*—Bell's History of British Quadrupeds, 28*s.* Yarrell's History of British Birds, Vol. I., 28*s.*; Vol. II., 35*s.*; and Parts 27 to 33, 2*s.* 6*d.* each. Bell's History of British Reptiles, 8*s.* 6*d.* Yarrell's History of British Fishes, 2d Edition enlarged, 2 vols., 3*l.* Forbes's History of British Starfishes, 15*s.* Jones's General Outline of the Animal Kingdom, 38*s.*—John Van Voorst, 1, Paternoster-row.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates.
Price 2*s.* 6*d.*

PAXTON'S MAGAZINE OF BOTANY. The Number for October, 1842, contains highly-finished drawings of *Sophronitis grandiflora*, *Erica Neillii*, *Pentstemon crassifolius*, and *Echites atropurpurea*; likewise Papers on Gardening as a science; on Planting Shrubs in Beds; and the Preservation of Half-hardy Plants through the Winter. Floricultural Notices of new or beautiful Plants figured in the leading Botanical Periodicals for September; together with a complete Calendar of Monthly Operations for the Garden.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.

2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.

3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.

4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

THE PATENT ASPHALTE PROTECTING MATERIAL, spoken so highly of in the *Gardeners' Chronicle*, may be obtained in Sheets—32 inches by 32 inches, 32 inches by 64 inches, 32 inches by 96 inches, of Thos. Jno. Croggon, 8, Ingram Court, Fenchurch-street. A Liberal Discount to Hothouse Builders, Nurserymen, &c.

WANTS a SITUATION as UNDER GARDENER or Gardener, and to look after a Horse and Chaise, a Young Man, aged 23; can milk a cow if required, and make himself generally useful; can have a good character from his last place. Direct to A. B., Mr. Gill's, Gardener, Stamford Hill.

WANTS a SITUATION as UNDER-GARDENER, a Young Man, aged 22; can be strongly recommended by the Gardener he is about to leave, and by his former employers.—Address A.B., J. and J. Fairbairn's, Nurserymen, &c., Clapham.

WANTS a SITUATION as HEAD GARDENER, a steady, sober Married Man, aged 30, who thoroughly understands forcing Pines, Grapes, Peaches, &c., also every other branch connected with the business; can have an excellent character from the place he has filled the last ten years. Direct to W. C., Mr. J. Fairbairn's Nursery, Clapham, Surrey.

WANTS a SITUATION as GARDENER, a Single Man, aged 27, in or out of doors, who perfectly understands his business in all its various branches; can have an undeniable character of three years from the gentleman he has just left. Address, A. B., Mr. Porter, Nurseryman, &c., Loughborough Road, Brixton.

WANTS a SITUATION as GARDENER, a Middle-aged Man of good character, who understands the management of the Greenhouse, the forcing of Melons and Cucumbers, and the routine of the Flower and Kitchen Garden. He can look after Horses and Cows if required, and has no objection to a single-handed place, or to make himself generally useful. Direct to W. B., Kidlington, Oxford.

New Zealand House, Broad-street Buildings,
22d September, 1842.

PORTRAITS by M. CLAUDET'S INSTANTANEOUS DAGUERREOTYPE PROCESS, under the Patronage of her Majesty, are taken daily, at the ROYAL ADELAIDE GALLERY, Lowther Arcade, Strand. The sitting generally occupies less than One Second, by which faithful and pleasing Likenesses are obtained. The introduction of Back-grounds, representing landscapes, interiors of apartments, &c., is the invention of M. Claudet, for which he has obtained Letters Patent. Considerable alterations have recently been made for the convenience and better accommodation of M. Claudet's visitors. Portraits and Groups of Figures are also taken upon plates of an enlarged size.

CASE OF DISTRESS. We, the undersigned, appeal to the Benevolence of the Public, and particularly to Gardeners, on behalf of the Widow of the late Robert Runciman, who is left with five children under ten years of age, wholly unprovided for. The late Robert Runciman was many years Gardener at Coptfold Hall, Essex, which situation he was obliged to quit three years since in consequence of the gentleman leaving the place; he was not able afterwards to obtain a situation in consequence of his numerous family, and he commenced jobbing Gardener, when he was unfortunately attacked with severe Rheumatism, which confined him for many months to his bed-room; and thus the little savings he had previously made became exhausted before his death. We knew him to be a steady, sober, and industrious man, and therefore confidently make this appeal on behalf of "the widow and the fatherless," in the hope that it will meet with that attention which the circumstances of the case deserve.

We shall be happy to receive Subscriptions, however small, in her behalf, and we beg to state, in justice to Mrs. Runciman, that this appeal is made without her knowledge.

John Green, Gardener to Sir E. Antrobus, Lower Cheam, Surrey.
David Ferguson, Gardener to the Duke of Buckingham and Chandos, Stowe, Bucks.
Saml. Young, Gardener to W. Branston, Esq., Skreens, Chelmsford, Essex.

Mr. Charlwood, of Tavistock Row, Covent Garden, has also kindly undertaken to receive Subscriptions.

HORTICULTURAL SOCIETY OF LONDON.
NOTICE IS HEREBY GIVEN, that the NEXT MEETING OF THE SOCIETY in Regent-Street will take place on Tuesday, October the 4th, at 3 o'clock, P.M.

The Gardeners' Chronicle.

SATURDAY, OCTOBER 1, 1842.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Tuesday, Oct. 4	Horticultural Floricultural	3 P.M. 6 P.M.
Saturday, Oct. 8	Royal Botanic	3½ P.M.

COUNTRY SHOWS.—Oct. 12, Guernsey.

AT a late meeting of the Academy of Sciences at Paris there occurred a very instructive instance of the danger of taking the assertions of experimentalists for granted, even when they are made with the greatest confidence.

It appears that a Dr. Pallas had sent the Academy, in 1835, a treatise on the Maize, in which he stated that sugar exactly like that of the Sugar Cane exists in it, and he would seem to have proposed it as a substitute in Europe for the sweet reed of the Tropics. This gentleman reduced the result of his investigations to the following propositions:—1, Maize stems, before flowering, contain little or no sugar. 2. At the time of flowering, traces of crystallised sugar are to be found in them. 3. The same stems, 20 or 25 days after flowering, and when the seed is still milky, contains about 1 per cent. of crystallisable sugar. 4. Later, that is to say, when the seed is perfectly ripe, and only requires to be dried to be gathered in, the stem, which at that time is still green, furnishes 2 per cent. of raw sugar, besides 4 per cent. of rich and good molasses.

These statements were remarkably opposed to others which had been previously made, especially to those of Professor Burger, who had ascertained, as he thought, that sugar is found in Maize in the greatest abundance immediately after flowering, and diminishes considerably after the corn is formed. They were also at variance with the experiments of others who had satisfied themselves that in Grasses, after the grain is set, the sugar is directed to the ear, where it serves for the nutrition of the young corn, and, changing its nature, disappears. Dr. Pallas's statements were, moreover, in conflict with the most certain and well-known fact, that at the time of flowering there is an excessive production of sugar in most plants, an external proof of which is found in the honey which collects in their blossoms. His propositions were therefore regarded as requiring confirmation.

Dr. Pallas then set about submitting his supposed facts to rigorous proof. He took for experiment a certain number of Maize plants: from some he removed the ears as they appeared; others he allowed to flower. He then crushed them separately, and he found that the juice of those which flowered marked two degrees less on the areometer than that which was obtained from the Maize stems whose ears had been removed. Hence he inferred, that the Maize contains most sugar before flowering—a conclusion which, it will be observed, was in direct contradiction to his first statements.

Unfortunately, however, for Dr. Pallas, it appears that his second experiments are not more satisfactory than his first. As M. Biot remarks, the indication of the areometer would show nothing more than the difference in the density of the fluids examined, and the juice of the Maize may be increased in density without the presence of sugar. The mere fact of the respiratory organs—that is to say, the leaves — of the Maize having had their action prolonged more in one case than the other, would account for the difference in density of the fluids in question.

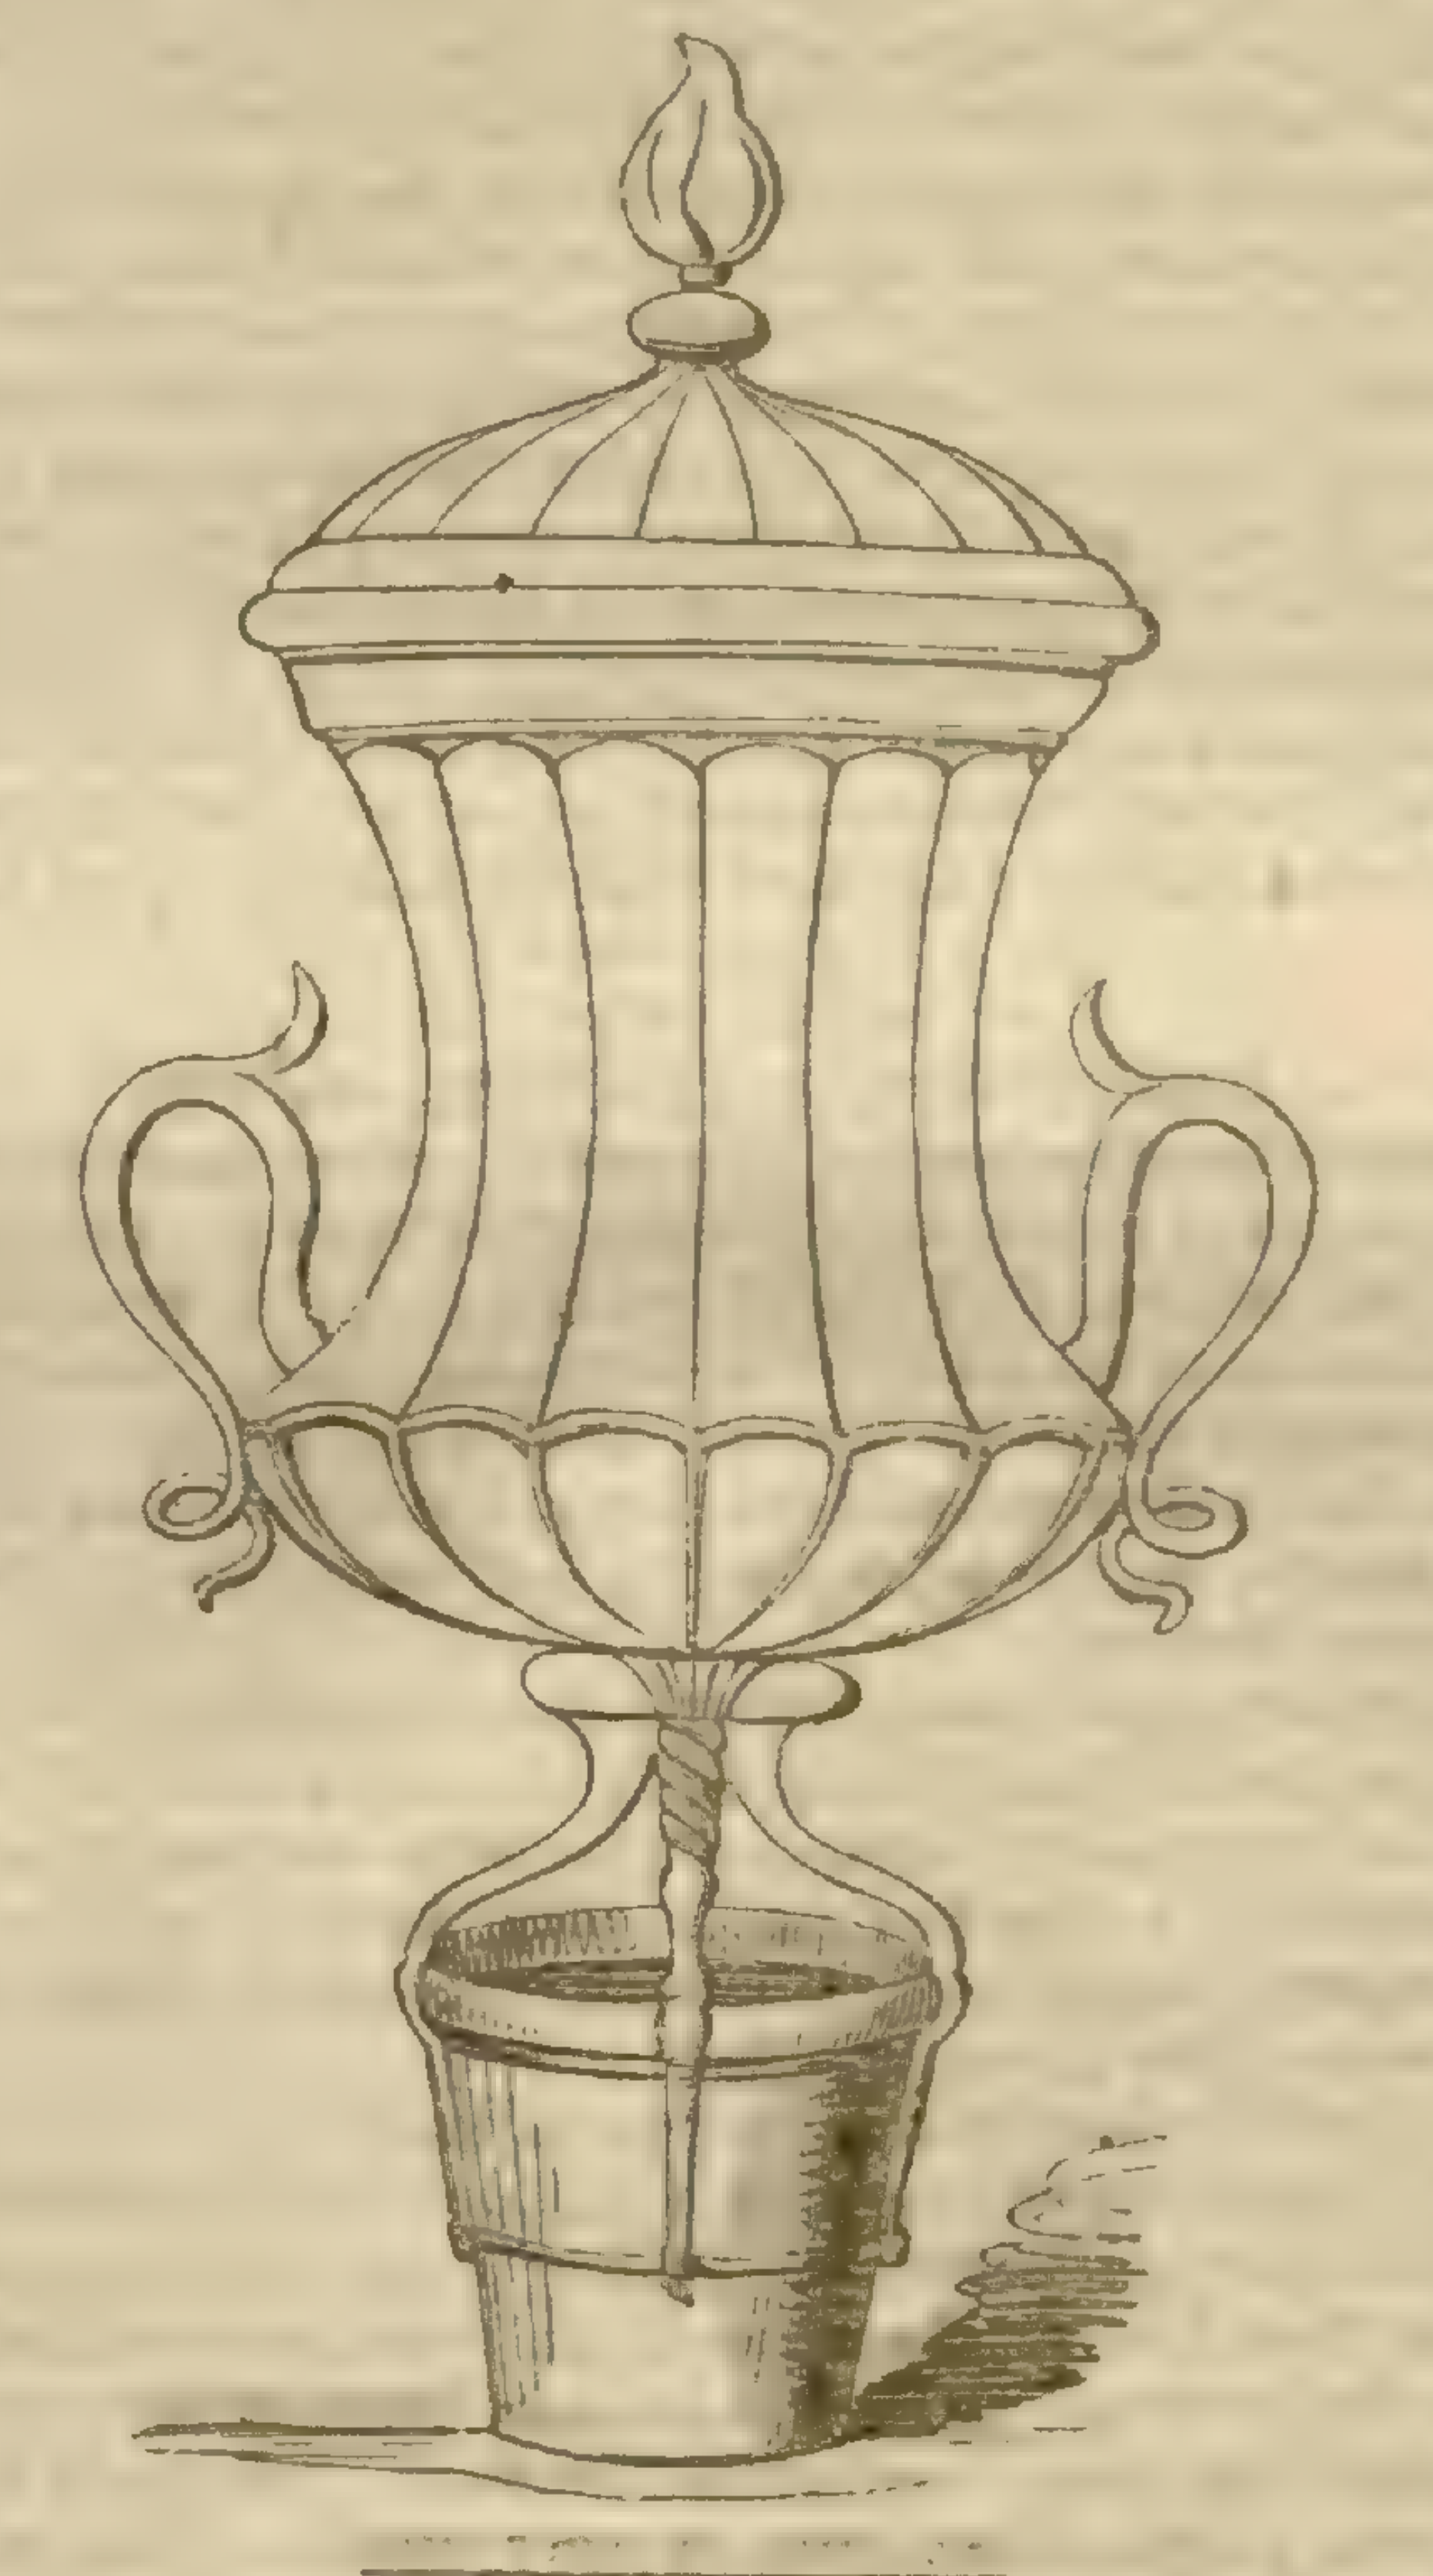
Here, then, we have, as we stated at first, one of the cases, of which we fear our books contain too many, in which experiments and observations, put forth under learned names, are adduced as good evidence of facts, while they are in reality of no sort of value, and only tend to mislead.

THERE has been no greater improvement introduced among the contrivances of modern gardening than the attachment of a wire trellis to flower-pots, so that climbing and creeping plants may be rendered portable. Formerly, the only way of managing such plants was, to train them to a stake or a rod, or to the rafter of a greenhouse; and these methods were so inconvenient, that climbing plants, although among the most beautiful of all exotics, not only for their gracefulness, but for the brilliancy and variety of their flowers, almost ceased to be cultivated, except where they could be treated as fixtures. Moreover, it was found difficult to flower many kinds whose roots, striking into the open border of the conservatory, either produced nothing but wood, and no flowers—the usual effect of exuberant growth; or, from the want of bottom-heat in the earth in which they grew, were unable to remain in a healthy state on that account. By cramping the roots of climbers in garden-pots, these two evils are at once removed; the plants cannot run to wood, and, if healthy, must flower; and they can be readily exposed to any amount of bottom-heat that may be desirable.

The beauty of greenhouses has been wonderfully increased by the contrivance of compelling these unmanageable, rambling, scrambling plants to grow down upon themselves, or round and round a circular trellis, so as to be compelled to clothe themselves all over with foliage, and to present immediately to the eye whatever flowers they produce. Every one who has ever witnessed the exhibitions in the garden of the Horticultural Society, must have been struck with the extraordinary beauty of the Russelias, and Tropæolums, Zichyas, and Hardenbergias, red, yellow, crimson, and blue, which have graced the stands of even the least extensive growers.

A great deal of ingenuity, and good taste too, has been shown by many gardeners in designing the wire-work on which climbers in pots are to be trained; but it is not to every one that nature has given a faculty of this sort; and it is not uncommon to see very ugly and ill-contrived trellises prepared at twice the cost of elegant ones. Applications without end have been made to us for assistance in this matter, a circumstance which sufficiently shows the want of them. We have, therefore, prevailed upon a friend to furnish us with a number of drawings for this purpose, any of which an ingenious gardener will be able to execute with wire of different sizes, and we shall publish them from time to time as we can find space.

The following would be well adapted for the coarser kinds of creepers, such as Echites suberecta, Bignonia jasminoides, Passion-flowers, or even Dolichos lignosus, any of which would produce a magnificent appearance if skilfully arranged upon it.



"MR. Cuthbert Johnson says, in his *Cottage Farmer's Assistant*, p. 87, that the Potato delights in rich soil, and in waste vegetable manure, such as sea-weed, chopped Fern, &c.; *lime is injurious* to it. On the contrary, Martin Doyle says, *Hints*, p. 48, 'Ground which has been recently limed, even in a very light degree, will, with the addition of dung, produce the largest and best crops of Potatoes.' Between Dr. Doyle and Dr. Johnson, I am fairly puzzled."

Thus writes a correspondent, who describes himself as a great friend of the Potato; and who is not? We were ourselves aware of the statement, that lime is injurious to Potatoes, and therefore have made it the subject of a little experiment, which we beg leave to mention.

A small piece of ground, on the London clay, some years since a kitchen-garden "run out," was laid down with Grass for three years. It was so low as to be little better than a morass in winter; and in wet summers, owing to the adhesiveness of the soil, was almost impassable. Last autumn, it was drained by means of two V ditches, half filled with bushes and directed into another ditch. By this means, full 18 inches of the soil were completely freed of water. During the winter, it was abundantly dressed with lime-rubbish, which in February last was incorporated with the soil by careful trenching—the old turf being turned down by the same operation. In April, it was planted with the Breadfruit Potato; and the crop which has just been taken up proves of excellent quality, and abundant. From an area of rather more than 26 rods, 98 bushels of Potatoes, of 56 lbs. to the bushel, or 2 tons 9 cwt. have been obtained; this is at the rate of something more than 15 tons an acre. But as the ground was partially overspread by trees, and in one place, for the space of three or four rods, had been an old walk, broken up in the trenching, and of very bad quality, it may be assumed that, in the absence of those disadvantages, the crop and quality of the Potatoes on this limed ground would have been even better.

It was, not, however, with lime alone that this piece of ground was prepared; advantage was taken of the opportunity to try the effect of certain other agents upon the growth of the Potato. Four rods were measured off on an average part of the crop, and taken as a *standard of comparison*; they yielded 11½ bushels of picked Potatoes and 2 bushels of small, or 13½ tons per acre. The same space of ground was treated with *nitrate of soda*, at the rate of 1lb. per rod, applied shortly after the sets had begun to sprout; from this were gathered 16 bushels of large, and 2 bushels of small, or 18 tons an acre. Another four rods received a dressing of *muriate of lime* at the same time and in the same proportion as the nitrate; and the yield was 16 bushels of large and 2½ bushels of small, or 18 tons and a half per acre. This amount of produce is very considerable, 12 tons being regarded as a heavy crop near London. An attempt was also made to ascertain the effect of what is called *salt cake*, a cheap and very impure kind of sulphate of soda, containing some free sulphuric acid. From four rods of ground dressed with this substance, at the rate of 1lb. to a rod, just 12 bushels of large Potatoes were obtained, and 2½ of small, or 14½ tons per acre. The salt cake, therefore, raised the crop above that in the common soil, to the extent of a ton an acre; but this result was less satisfactory than the others, because the ground treated with salt cake was the poorest part of the field.

If these results are to be trusted, a dressing of nitrate of soda, worth forty shillings an acre, increased the produce 5 tons; while muriate of lime, worth a smaller sum, augmented the crop rather more. Although they will require verification in a future season, they prove this pretty clearly, that lime is advantageous to a Potato crop, and not injurious.

We may remark, in conclusion, that the land where these Potatoes were grown was sadly infested with slugs; but that the crop was much less attacked where the nitrate of soda was used than elsewhere.

Many of our readers must by this time have ascertained the result of their own experiments on Potatoes; and we trust they will, in return for this piece of information, favour us with the particulars of them.

GARDEN EXHIBITIONS OF THE HORTICULTURAL SOCIETY OF LONDON.

I DO not know whether or not the society has received any suggestions from those interested in the exhibitions at Chiswick, in compliance with the request in the advertisement which appeared for a few weeks in your columns; but as I think a little alteration in some points desirable, I will take the liberty, if you will allow me, of adverting to the subject through the medium of the *Gardeners' Chronicle*. The most cursory observer cannot fail to see that one of the objects of the regulations is to afford to all persons the means of exhibiting their productions of horticultural skill, and to reward merit wherever it is found, whether in what is termed the small grower, who can only produce a few single specimens, or at most a small collection, (see regulations,) or in those who have the means of competing for the highest prizes which are offered. That such is the case, is evident from the notes appended to the letters F and R, in the list of subjects for exhibition. Thus, there are prizes offered for large collections of Cape Heaths, and large collections of stove and greenhouse plants, and also for small collections of the same things; but the exhibitors of large collections are prohibited from putting up small collections at the same time; and thus the "small grower" has a chance of being rewarded and encouraged, as well as others in a more extensive way. These principles are excellent—they work well, and I would therefore wish them to be carried a little farther, and applied to letter W—the single specimens. The exhibitor of a large collection of plants ought not to be allowed to put up "single specimens" of articles which are not more interesting than many of those in his "collection," for it does no good in a horticultural point of view; and tends to discourage those who have no means to show for the head-prizes. The head-prize for the large collection is offered for the best specimen of horticultural skill, and the exhibitor who acts fairly will always put his best plants in his "collection." If he has any specimen which has peculiar claims to notice, such, for example, as a new ornamental plant, he ought then to be allowed to exhibit this in the class of single specimens, but not otherwise. The society would thus encourage the good gardener whose means are very limited; the best specimens of old plants would be kept in the collections; and these exhibitions would still be, as heretofore, the means of bringing together all the new ornamental plants. And it would be much more simple with reference to the judges; for, according to the present system, I cannot see how they can do anything like justice in the general arrangement of the awards. They find, for example, a good specimen of Ixora coccinea the best amongst the single specimens, and they give it a prize; but there are better ones in the large collections, and when the names of the exhibitors are put to the plants, it is discovered that this plant really belongs to an exhibitor who has been showing a large collection. In this case, which is not an unfrequent one, it would, I think, be very difficult to show that any real good had been done by the award.

But there is another reason for such an alteration, and it is this:—Mr. A. and Mr. B. are nurserymen or gardeners, as the case may be, who exhibit large collections. When Mr. B. is setting up his plants, Mr. A. walks quietly round, and casts his practised eye over them, when he sees at once that his neighbour's are better than his own—that is, provided he can see the beauty of other people's plants. "Oh!" says Mr. A. to himself, "I have no chance with B., but I am sure enough to come in second, for Mr. C.'s plants are far behind mine; I will, therefore, pick out a few which I intended to put in my collection, and give them a chance amongst the single specimens." And when he finds that he has "come in second," and that he has also carried off two or three medals for single specimens, he "laughs in his sleeve" at the judges and the society, and says, "There is nothing like a little scheming." For these, and similar reasons, I think the society should print under letter W., in their regulations, "*No person who shows in P or Q will be allowed to exhibit also in W, unless the subjects are new or rare.*"

I also think that a little alteration ought to be made in the Pelargonium class. The medals now given are too high, particularly if they are compared with those offered for other things, as, for example, Orchidaceous plants. The Gold Banksian is given for 12 specimens of Pelargoniums, and nothing higher than that medal is offered for 6 specimens of Orchidaceæ, when all must acknowledge that it is far more difficult to produce the latter than the former. And with regard to the interest and effect connected with ornamental Orchidaceous plants, all that I have to say is, to point to the sensation they produced amongst the visitors at the last exhibition. What I would recommend with regard to Pelargoniums would be this:—reduce the medals in letters J and K, putting the latter upon the same level as a collection of 6 Greenhouse plants, and not above it, as it now stands; and open up another class for Pelargoniums, with a regulation something like the following:—"*for* 12 *of the finest varieties of Pelargoniums, in pots, not exceeding* 24 *to a cast.*" The object of this would be, to encourage the production of very fine flowers, and to give a chance to the amateur who has not room to fill a house with 8 or 12 plants.

There might be some judicious alterations made in other parts of the prize list, particularly with regard to Roses; but the society has probably had many suggestions relating to them from exhibitors. In conclusion, as these remarks will probably not meet with approval from all the exhibitors, I may add, that I have, as you know, no interest in them myself, further than wishing to see the regulations as perfect as it is possible for them to be.—*Criticus.*

[We understand that the advertisement in our columns has already produced the society a large number of letters, containing various suggestions; all which letters are under the consideration of the Exhibition Committee. We, too, have received several communications, which, as they have not appeared suited for publication, have also been sent to the Committee. This letter, however, of *Criticus*, a very sensible person, and one who, as he truly says, has no interest in the exhibitions, adverts to some matters upon which we should like to hear the opinions of gardeners. For ourselves, we agree with *Criticus* in most of his suggestions, and perhaps in all of them.]

ON ANIMAL MANURES.—No. II.

(By Professor Charles Sprengel. Translated from the German.)

2. *Bones.*—No manure has of late excited more sensation than bones. It was more especially the English who fixed attention upon them, assuring us that some sorts of agricultural produce have been doubled and trebled by the use of bone-dust. Not satisfied with the bones procurable in their own country, they have been brought for the last 20 years from all parts of Europe to England, and are used with perfect success.

Notwithstanding the great repute in which bone manure is held by the English and other nations, it has made but little progress in Germany! Whence does this arise? I am of opinion that the German soil (in such places where bone manuring has been practised without success) is not yet exhausted of bone earth, (phosphate of lime,) whilst the soil of England has been so much exhausted of it by the continual growth of Wheat, that it cannot be called into new fertility, without either a manuring with bones, or the phosphate of lime therein contained. That it *is* this substance to which bones chiefly owe their manuring quality, is proved satisfactorily by the circumstance, that even burnt bones, in which, therefore, the whole of the cartilage containing nitrogen is destroyed, still yield a superior manure. Of this I have become convinced by *comparative* experiments, which I repeated more than once. Moreover, those bones will yield manure, which, by a protracted boiling, have been deprived of their cartilaginous matter; for instance, the sheep bones used in making paper or glue. I have often found that manuring with bones produces a most decided effect upon soils which contain none, or very little phosphate of lime, provided such soil was not deficient in humous earth, the solvent of phosphate of lime. I have also remarked that bone-dust is nearly useless, if the soil was not deficient in this phosphate. Amongst the countries where manuring with bone-dust has proved useless, Mecklenburg is one; and although I cannot positively assert that its soil contains a sufficient quantity of phosphate of lime, yet this is more than probable, because *all* the marl with which, for the last 20 years, the fields of Mecklenburg have been manured contains a great deal of phosphate of lime. If only 50,000 lbs. of marl were conveyed upon a Magdeburg acre, and if this did not contain more than 1 per cent. of phosphate of lime, still 500 lbs. of this salt would thus, by the agency of marl, have been brought upon that space of ground, and this is more than enough to supply a crop with sufficient phosphoric acid; and the more so, because wheat, which chiefly requires it, is not much grown in Mecklenburg. If, however, the phosphate of lime in bones (56-70 per cent.) be the substance to which they chiefly owe their manuring qualities, still we must admit that the other substances contained in it also advance vegetation, especially their *cartilage*, rich in nitrogen; so, also, *fluate of potash*, which they contain in small quantities (10 lbs. in 1000 lbs.), may be reckoned amongst their manuring principles, as indeed is the more probable when we consider that human bones, which are the richest in fluate of potash, are the most efficacious as manure. That, however, after phosphate of lime, cartilaginous matter is the most important agent in bone manure, becomes evident from its weight being one-third of the whole, and containing 16-17 per cent. of nitrogen. If, for instance, one Magdeburg acre be manured with 1000 lbs. of bone-dust (which, no doubt, is a large quantity), 50-55 lbs. of nitrogen would thereby be brought into the soil, and this must exercise a considerable effect on vegetation; for, according to the experiments of Boussingault, 1000 lbs. of wheat do not contain more than 24 lbs. of nitrogen, and 1000 lbs. of wheat straw not more than 3 lbs. of nitrogen. If we therefore assume that the Magdeburg acre will yield 2000 lbs. wheat and 3000 lbs. straw, the cartilage would yield the quantum of nitrogen for one crop, even if the wheat could not obtain any other nitrogen from other substances in the soil, nor absorb any through the leaves from the air. Since, then, cartilage is an important substance in bones, it is evident that those which have lost that ingredient by lying for a long time in the air cannot yield such good manure as fresh ones.

Bones are also rendered fertilising in consequence of their containing soda and common salt; 1000 lbs. of them contain 35lb. of these substances, and it is known from experiment that 60lbs. of common salt are sufficient manure for one Magdeburg acre. Moreover, their containing phosphate of magnesia (a substance especially found in wheat) must also be advantageous, for in 1,000lbs. of bones, the usual quantity of manure for an acre, 30lbs. of phosphate of magnesia are to be found. The small quantity of fat and marrow which bones contain is scarcely to be taken into account, although some have laid much stress upon it.

(*To be continued.*)

CONIFEROUS PLANTS.—No. IV.

The following notice of Junipers will be confined, like the preceding ones on Coniferous Plants, to the more rare and less known kinds, with remarks on the errors and false names to be found in collections. The species may be arranged under the three following heads, viz.:—

1. True Junipers, with large, open, glaucous leaves and shoots, on the adult plants; and round fruit, like the common Juniper.

2. Savin Junipers, with the dwarf-spreading habit and appearance of the common Savin, or prostrate Juniper.

3. Cypress Junipers, or those with the habit and appearance of a Cypress (when old), having small, close, imbricated leaves and shoots in the adult plants, and rather angular or scaly fruit.

1*st Section. True Junipers.*

1. Juníperus oblonga (the Oblong-fruited Juniper).—This is rather a robust, spreading plant, seldom growing more than two or three feet high (except when trained to a single stem); the leaves are like those of the common Juniper, but longer and more slender. The fruit, which is dark purple when ripe, is very small. The variety mentioned in the 2d edition of the Arb. Brit., page 1082, as J. communis oblonga péndula, at Kew, is a plant of this species, trained to a single stem; if left to nature, it will not rise more than three feet, but will spread over a large space of ground. It is quite hardy, and a native of the Caucasus.

2. Juníperus Oxycedrus (large Brown-fruited Juniper).—This species forms rather a tall confused-looking bush, with the points of the young shoots twisted in various directions, some even pendulous. The leaves are large, of a darker green above, and less glaucous on the under side than those of the common Juniper. The fruit is large, round, and of a light brown colour when ripe. It is a native of Spain and Portugal, and attains about the same size as the common Juniper, but it is less hardy than that species. It is, however, sufficiently hardy to stand through the winters in England. The Juniperus Cracóvia, supposed by some to be the same as this plant, and by others considered to be a distinct species, is not different from Juníperus communis. The Juníperus taurica is also only a slight variety, differing principally in the leaves being shorter, broader, and less glaucous, and in the plant being much hardier; it is also said to grow on the mountains of Tauria to a larger size; the fruit is brown-coloured, like J. oxycedrus, but rather larger.

3. Juníperus macrocarpa (the large Purple-fruited Juniper).—This, like the Taurian variety of Juníperus Oxycedrus, seems to be only a variety of that species, but is certainly a distinct one. The leaves are much larger, more glaucous, and of a lighter green. The berries are very large, and of a purplish black colour. It is quite hardy, and forms a large bush or small tree; it is a native of Syria and Greece, and probably is the same as Juníperus drupácea; at least all the plants or specimens that I have seen under that name are so.

4. Juníperus squamosa (the Creeping Indian Juniper).—The leaves of this very distinct Juniper are very short, rather broad, of a dark green on the under side, and slightly glaucous on the upper one; they are very thickly set on the shoots, and the plant possesses the rigid branches and prostrate habit of Juníperus nana. Like that plant, it will spread over a large space of ground, without being many inches in height. It is from the northern parts of India, and is quite hardy; the fruit is rather small, and dark purple. This is the same as Juníperus rígida in some collections.

5. Juníperus recurva (the Recurved Indian Juniper).—This somewhat resembles the preceding in foliage, but its leaves are much longer, narrower, not quite so dense, and more glaucous. It forms a handsome small tree, with pendulous branches (particularly the extreme ones), growing from six to ten feet high, and is easily distinguished from all others by its weeping appearance. It is a native of the northern parts of India, and is quite hardy. The fruit is rather small and purple. There are two distinct forms of this plant, one the male, the other the female (on separate plants); the male plant being the more robust and spreading of the two.

6. Juníperus nana (Dwarf Juniper).—This species is known also under the fōllowing synonyms:—Juníperus montana, J. saxátilis, J. sibírica, J. daúrica, J. canadensis, and, sometimes, J. alpina; but the true J. alpina belongs to the Savin Junipers. I do not agree with those who consider J. nana, oblonga, and suecica to be mere varieties of the common Juniper; surely there is but little resemblance between Juníperus communis and J. nana, either in habit or foliage; and the Swedish Juniper has the same claim as the Lombardy Poplar among Poplars. There is a plant in some collections, bearing the name of Juníperus dealbata of Douglas, from the N.W. coast of America, but not Douglas's plant, which is not distinct from Juníperus nana. The plant now in gardens under that name is one of the species with small leaves closely imbricated, and is probably the Juníperus occidentalis of Sir W. Hooker.—*George Gordon.*

(*To be continued.*)

AMATEUR'S GARDEN, No. XL.

You are, perhaps, fond of Rhododendrons and other beautiful American evergreens, but complain of the expense of making borders of peat earth for them to grow in; have you ever planted them in common garden soil? I know that many persons say they have planted them, that is, they have dug a little hole which would scarcely hold the roots; they have covered them with mould, trampled them firmly down, and then left them to live or to die; and, when the poor plants became stunted and unhealthy, the blame was thrown upon the soil, and we were told that it was of no use attempting to grow such things without peat earth. That is doubtless one of the best soils in which they can be grown, but in some parts of the country they succeed equally well where there is no peat; and this is a sufficient reason for the conclusion, that the latter is not indispensable. In the present state of horticultural chemistry, it is impossible for the amateur to know without a fair trial, whether the soil common in his neighbourhood is suitable for this purpose or not; but even where it is not very congenial, it may be made so, to a certain extent, without the aid of peat. In order to do this, it is necessary to bear in mind that there are two mechanical effects produced by peat, which probably exert great influence in maintaining the plants in a vigorous and healthy state; these are its power of retaining moisture, and its never becoming hard and stiff. Any one, therefore, who has in his compost ground leaf-mould and loam, with a little rotten dung and sand, can easily form a soil which will not be of a close texture. In the following summer after planting, when the warm weather arrives, and the ground is apt to get dry, let it be top-dressed with cow-dung, or where that cannot be conveniently procured, decaying leaves may be used as a substitute; the former is preferable, but either the one or the other will keep the roots cool and moist; and thus both the mechanical effects of the peat will be imitated. But all this will be of little use unless the plants are carefully planted. Where a single specimen is put in, a hole should be made, much larger than is actually necessary to hold the roots, and about eighteen inches in depth; it should then be filled with the compost described above. When the plant is put in, the fibres should be carefully spread out in all directions, and this ought to be most particularly attended to, if it has been growing in a pot; for the roots are, in this case, twisted and bound together. After filling in the soil, it must not be trampled upon, but a basin should be made round it and the whole liberally watered. These remarks will be followed next week with some directions for making peat clumps or borders for American plants, with observations upon the time and weather for planting, which, I trust, will be useful to the amateur in gardening.

Neapolitan Violets, which were propagated in the early part of the summer, may now be taken up and planted in a frame. The soil to which they are removed ought to be light and rich, having a well-drained bottom; the frame should be placed in a sheltered situation fully exposed to the sun. Plant rather thickly, and pick off the points of the side shoots as soon as they appear; this enables the plants to flower freely from the centre, and keeps the frame from getting too full of leaves. A few plants may also be potted and placed in the greenhouse, so that when they come into flower, they can be taken into the sitting room. There is a very pretty variety, called the "Tree Violet," which flowers abundantly all the winter, and is well adapted for purposes of this kind. Hyacinths and other bulbs for flowering in glasses in rooms, or for the borders of the flower-garden, may now be procured. In selecting them, choose those which are firm and smooth, and take care that both bottom and top are perfect.—*R. F.*

HOME CORRESPONDENCE.

Transformation of Flowers and Fruit.—Having seen in your *Chronicle* of Sept. 3, a paper upon the transformation of flowers and fruit into leaves, I take the liberty of troubling you with a few lines, to show that the theory of fruit being formed out of leaves has been generally adopted on this side of the Channel. The phenomenon of the transformation of flowers and fruit into leaves has long been witnessed, not only by physiologists, but also by gardeners in the exercise of their duties: it has become the basis of the doctrine of those botanists who consider the flower, and the different organs that compose it (not even omitting the result of their functions—the fructification), to be formed of an assemblage of leaves that have undergone certain modifications. The majority of French botanists have now adopted this opinion, which at first gained ground very slowly among them, as there was a want of conclusive proofs in support of a theory subversive of all their ideas previously conceived respecting the organisation of a flower. I was rather astonished at seeing your article upon this subject begin thus:—"Many attempts have been made to overset the *modern* theory, of fruit being formed out of leaves;" as this opinion had been entertained by several ancient [are these writers ancient?] botanists, particularly Jungius, Linnæus, Fred. Wolf, and by the learned Goethe, in his small work entitled "The Metamorphosis of Plants," published in 1790. A flower is nothing more than the transformation of a bud (says Du Petit-Thouars), the different parts of which form several whorls or circles placed one above the other, and separated by extremely short spaces. According to this mode of viewing the organisation of a flower, it, when complete, would consist of four circles of leaves diversely modified; of three, when hermaphrodite, with a single calyx; of two whorls of leaves when hermaphrodite and deprived of a calyx; and lastly, of one circle of leaves, when merely male or female, without a calyx. Having enumerated the four kinds of complete and incomplete flowers, I will now examine the nature of their different parts. The leafy nature of the constituent parts of a flower is easily seen in the calyx, whose sepals have generally the appearance and structure of real leaves; being commonly of a green colour, and having prominent nerves, in which spiral vessels are found. Linnæus describes it as the "external covering formed out of the bark" (è cortice). A monosepalous or gamosepalous calyx is composed of leaves more or less closely united. The corolla is also formed of a circle of leaves, which have, however, undergone important modifications. These leaves are distinct or united (polypetalous or monopetalous corolla). The stamens form the third circle. Their analogy to the petals is so great, that we frequently see the staminal filaments widen into petals, as in double flowers, so that the filament of a stamen may be considered as the middle nerve of a leaf. The anther is a leaf whose margins are rolled towards the middle nerve, and form two (sometimes one or four) cells filled with a cellular tissue, which becomes the pollen. The pistil may be considered as the result of one or several verticillate leaves (which are very visible in the Double Cherry), the margins of which converge towards each other, and unite to form the cavity of the ovarium. The ovules are regarded as buds, consisting of modified leaves. When, therefore, we witness one of these, to us, unnatural productions, we may look upon it as an effort of the plant to return to its normal type, it being unwilling to submit to that restriction and to wear those chains which prevented its extremities from lengthening into longer branches, and so furnished us with those exquisite ornaments that adorn our gardens or apartments. As another instance of this tendency of the floral organs to become leaves, to be added to the two cases produced in your paper, I will mention that Du Petit-Thouars, the famous French physiologist, and after him, M. A. Richard, had in his possession a flower of Tropæolum majus, in which the calyx, corolla, stamina, pistil, and ovula, had assumed the appearance of true leaves; occupying, however, their several respective positions. We observe a similar phenomenon in several cruciferous plants, and, amongst others, in the Túrritis glabra. I once had a Rosebud, in which all the rudiments of the future flower, excepting one or two young petals, had united into two solid greenish masses of equal size. Cannot the cause of these and similar appearances be found in an over-supply of nourishment, causing too great an accumulation of sap in the upper parts of the plant; which accumulation pushes the receptacle of the flower upwards? The hitherto hidden organs, abundantly supplied with a coarse, unelaborated (?) sap, and exposed to all the influences of the atmosphere, become green, and assume all the characters of a real leaf, or form a shapeless herbaceous mass. Flowers overpotted, or growing in a damp, rich soil, produce few or no flowers.—If these lines should be worthy of a place in your journal, they may, perhaps, still further "stimulate your readers to look for instances like those you have produced; and also to explain them, if they can, upon any other principle than that of regarding a fruit as a composition of leaves."—*Charles Anson Teale, Versailles.*

Singular Growth of a Cucumber.—Last Saturday I cut a Cucumber with a perfect leaf and stalk growing from the middle and on the under side of the fruit. In less than an hour after the fruit had been cut, although kept in nearly the same temperature, the leaf began to droop and wither. I imagined that the leaf would not fade so soon, growing, as it did, from the fruit; but it seems there is no difference whether a whole fruit or a portion of the stem is left in connexion with the leaf.—*W. Brown, Merevale.* [This was, probably, an instance of grafting taking place naturally, by the fruit and petiole of the leaf having come closely in contact during the early stage of their growth. As soon as the fruit was cut the circulation of sap ceased, and the leaf would, of course, droop just as soon as if a portion of the stem only was left adhering to it.]

Remarks on the Male and Female Ash.—In Nos. 15 and 16 of the *Chronicle* are some interesting observations by Mr. J. Townley, on the qualities of the male and female Ash as timber. I have recently made inquiry of those who work upon Ash-timber without obtaining any satisfactory facts as to which of them is the more valuable, but all agree that the difference is great, as they can tell by the appearance and working of the wood. One asserts that the male is the stronger—another says the female—but on close interrogation none could tell which was the male or female, as they had neither observed nor marked the trees which bore the seeds while growing, without which no satisfactory conclusion can be drawn. They also agree that the grain of one is much finer and closer than the other; that which is supposed to be the male having streaks of what they called dirt, of a brownish hue, between the ligneous layers of the whiter wood. This streak is probably from its quicker growth; but from the conflicting opinions of my informants nothing of certainty can be entertained until the question is demonstrated from experimental facts. From numerous observations I have recently made, I do not find one tree in fifty which can be called the true male Ash; that is, one without seeds. But as some trees are monœcious, and some nearly diœcious, it appears that the trees bearing chiefly diœcious flowers are of the male sex. These produce but few seeds, which is no doubt the reason why they grow faster and to greater bulk; having more branches and leaves in consequence of not bearing seeds. I also suspect they produce the toughest and most elastic timber, for there appears a difference with respect to the latter quality. Other trees being monœcious, or having both sexes on the same tree, the seeds are more regularly impregnated and brought to perfection, which undoubtedly causes the tree to be of slower growth and less valuable. In this neighbourhood I can scarce see an Ash-tree (and they are very numerous), that has not some seeds upon it; whereas, after the leaves have fallen, I have generally perceived but few with seeds upon them; but many of those with numerous seeds retain them till late in spring. There are three Ash-trees near my residence, two of which appear to have been planted about 60 years ago. One is a prolific seed-bearing tree; the other, as I can perceive no seeds upon it, I take to be the diœcious or male Ash; and it is not only one third more in girth than the female, but much more handsome and vigorous in growth. Therefore, I am inclined to term all such trees, with but few seeds upon them, males, as well as those with none, if such are to be found, unless I obtain further information from facts. I must, however, confess, that out of all I have examined, I have not found above three or four trees of any magnitude without some seeds upon them, and those exceptions might have some that I could not perceive. I will endeavour next season by means of the wheelwrights, and further observations, to come to some satisfactory conclusion on these points, being fully convinced of the value of the Ash as a timber-tree. I perfectly coincide with Mr. Townley that it would be of great advantage to know which is, properly speaking, the male, and which the female, and by well-conducted experiments to ascertain which of them produces the better timber, as well as the effect which perfecting the seeds produces on the quality of the timber. Some trees are earlier than others, and differ much in their hues in the same localities, a circumstance which is observable in the Oak and other trees, and which I suppose to arise from some slight difference in the varieties, or from the soil. Sixteen years ago I measured the girth of two very large old Ash-trees in Preston-Gubball's churchyard, near Shrewsbury; this year I have measured them again, and find one of them to have increased in girth an inch each year on an average—the other something less. There is little difference in the appearance of the heads, but the one which has increased most has the shortest trunk and is hollow in the centre, and from its having but few seeds upon it I suppose it to be the male. I have also recently measured two more Ash-trees in the park of W. Ormsby Gore, Esq., Porkington, near Oswestry; the girth of one at four feet from the ground is 15 feet 2 inches; that of the other 12 feet—both appear to be of the male kind. This seems to confirm the fact that the male Ash, as it is termed, produces not only the best timber, but the largest and most handsome trees; and all my recent observations tend to confirm me in this belief. A friend of mine informs me that there are no hermaphrodite flowers upon the Ash; but that on some trees the male flowers preponderate greatly. On others, the female flowers are most numerous, and produce the great quantity of seeds found on some trees; consequently the latter is called the female, and the former the male. My own observations tend to confirm me in the belief that there are no trees distinctly male and female. — *W. Billington, Underhill, Oswestry.*

Ficus australis.—Dr. Liebig's opponent seems to be somewhat sceptical on an experiment, made many years ago, by that intelligent botanist, Mr. M'Nab, the curator of the Edinburgh Botanic Garden, in reference to the growth of the Ficus australis, apart from, and independent of the soil. I remember to have seen it luxuriating, although tied to the rafters of the conservatory, with its roots dangling in the air; in which condition it had already existed for the three years previous. A phenomenon equally remarkable may be seen at Alton-Towers, in the case of the Ficus elástica, under the judicious care of Mr. Forsyth. A large and diffused branch of this species, severed from the parent plant, is attached to the wall by what appears to be an aërial root, or tentaculum; still it is a healthy and vigorous plant.—*J. Murray.*

The Wild Fig.—In answer to P. Mackenzie's query, "whether any attempt has been made to introduce the Wild Fig into this country?" I have to state that, several years ago, the seeds of some Smyrna Figs were sown in the garden of my father, the Rev. T. Ruckett, at Spetisbury, near Blandford. They came up freely, and were planted out. Two of them are now in our garden, near Lincoln: others we have at our present residence; they having been rooted up by the gardener of my father's successor. One or two have shown fruit; but they have hitherto dropped off before they reached maturity.—*D. Solly, Heathside, near Poole.*

The Natural Instinct of Birds.—I was greatly amused in the early part of yesterday, by observing a flock of several hundred swallows and martins congregating together, in three trees adjoining my garden, previously to their departure from this neighbourhood. The morning being still and clear, with the sun shining, they flew about in gyrations, trying, I suppose, their powers of flying. Sometimes they would alight upon the trees, and then fly off again, repeating the same manœuvres several times for nearly an hour; sometimes they would mount up to a great height, appearing to try how long they could soar without moving their wings, as I have seen kites do in my boyish days. It was the most beautiful sight of the kind I ever saw;—indeed, I never observed this natural occurrence before. Picture to yourself, when they were on the round-headed Elm-tree, a large Snowberry-bush of that size and figure, with its white berries and dark leaves; or a very tall Apple-tree thickly studded with large snow-white flowers or fruit, of the size of a small Crab, among the dark leaves. Such was the appearance of the tree and birds, with their white breasts and dark feathers facing the sun, among the deep foliage of the Elm-tree. After about an hour had been passed in this exercise and in other preliminary preparations, their numbers were collected, and about eight o'clock, while I stood watching their motions, they all took flight in a south-easterly direction; and as the sky was a little overcast in that quarter, I soon lost sight of them; none were left except a few stragglers that were too late, or were probably waiting to collect and bring up the rear. The direction of this flight would, in a straight line, take them to the coast of Sussex or Kent, opposite the Straits of Dover, and nearly in the same direct line to the South of France or Italy, where I have either heard or read they go to in winter. And how true is instinct, thus to direct them in a straight line to the narrowest part of the sea, and to their winter quarters! Their first day's flight would probably be to the sea-coast. It was a pleasing sight, and passing my powers of description, to behold them, in their gyrations, with their white breasts turned towards the sun, appearing like twinkling stars glimmering in the sky. This day is wet and dull; could they foretel the weather? One might fancy they had some notion of religion, as they did not choose to travel on the Sabbath. Has any one else observed such a thing on the same day and hour, or when they arrived at the sea-coast nnd took their flight from it? If so, perhaps some of your correspondents from the Kent or Sussex coast will communicate to the public through your Paper.—*W. Billington, Underhill, near Oswestry, Salop, September* 20.

Remedy for the Sting of a Wasp.—In addition to the many recipes already given to allay the pain occasioned by the sting of a wasp, I beg to inform your readers, that the juice which exudes from the petiole of the Fig-leaf, upon its being broken, is a certain remedy.—*J. A.*

To destroy Slugs.—I have read with little benefit all your paragraphs respecting the destruction of slugs. My garden, walled all round, is ruinously infested with them, and I have tried lime, salt, soot, saw-dust, &c., but find nothing so effectual as the following traps, viz., Savoy leaves, the rougher the better, placed about the borders, with a stone laid on them to prevent the wind from moving them. These my man examines daily, knocking the slugs off into a pan of salt or brine. In this manner I destroyed between Oct. 7, 1841, and May 20, 1842, 36,423, besides 2000 more killed incidentally.—*Estus.*

Rain-water Tanks.—In the discussions which have recently taken place respecting the best modes of constructing and lining these useful resevoirs, there has been, I believe, no allusion made to two circumstances which I have reason to think are of considerable importance. The superiority of a cemented brick tank, as compared with a wooden butt or a leaden cistern, is probably not so much due to difference of material as to the frequent seclusion of the former from light and air. So far as I have been able to observe, rain-water for domestic purposes is never so good as when kept in perfect darkness, below ground, and with no more access to air than is supplied by the feeding-pipes themselves. Water thus preserved has a pureness of colour and even of flavour which seem scarcely to be expected from the scourings of roofs and gutters, and which can with as little likelihood be ascribed to mere subsidence. I was at one time led to attribute this effect, partly to the absence of light, and in some measure to a stratum of carbonic acid gas, which in sunken chambers might possibly lie on the surface of the water, and which would insulate from the atmospheric air all the animal and vegetable matters, both dead and living, which must of necessity be carried into such a receptacle. I endeavoured in one instance, where the tank was literally a cemented well, to test this last idea by lowering pieces of burning paper to nearly the level of the water. The light was several times extinguished at some little distance from the surface, but I cannot say with certainty that the extinction might not have been caused by the vapour or coldness of the water, or by a current of air, or by bad management. It is, nevertheless, I believe, unquestionable that a very dark and nearly air-tight vessel is the best container of rain-water for a dwelling-house. To conservatories a few decomposing leaves and their attendant animalcules are perhaps of little consequence, if indeed they are not beneficial.—*A. Ainger.*

Liquid Manure.—I have a tank containing 270 gallons full of liquid manure from the dwelling-house, and stable wherein my pony is kept: I have fixed its ammonia by means of oil of vitriol. I shall be very much obliged if either yourself or any of your correspondents can inform me how by some simple and inexpensive method I may manure my meadow with such liquid as this, without being obliged to mix it with earth prior to its application. Might a barrel be in any way prepared and put into my little cart, and drawn over the field with my pony?—or would it be better on a meadow of only two acres to have a skeleton wheelbarrow, with a barrel placed thereon properly prepared for regularly distributing the liquid? I have been in the habit of using liquid manure *exclusively* for my garden (of 1 rood 9 perches statute), and with the greatest success. I have manured with it only my Strawberries—as well as all my vegetable crops—and with the greatest success; and I doubt not that by means of it I could grow the same crop for 20 years on the very same spot of ground.—*Jonathan Labyrinth, Bodmin.*—[Liquid manure is undoubtedly the richest and the most fertilising of all the forms of manure. If any our correspondents will favour us with good plans for the construction of the carts in which it can be conveyed on the land, we will have woodcuts made from them. In the mean while, we apprehend that a barrel may be converted into a simple apparatus by attaching to it a hollow tube in the form of the letter T. Let the end of the shank be inserted into the lowest part of the barrel, and the cross-bar be pierced with holes; then adjust a stop of some kind to the base of the shank where it enters the barrel, so that by withdrawing it the fluid may rush into the pierced cross-bar, or by replacing it the influx may be stopped; and a contrivance like the London water-carts will be prepared, which will no doubt distribute the fluid tolerably well.]

Dear Mr. Editor,—Excuse my familiarity in addressing you as an old acquaintance who has known you from your birth, and rejoices in your vigorous maturity, of which the Stamp-office returns afford such satisfactory evidence. I doubt whether in your proposed register of extraordinary horticultural productions you will ever record such a phenomenon in all respects as the rapid growth of the *Gardeners' Chronicle;* but to the point,—You occasionally favour your admiring readers with some agreeable poetical quotations and extracts; and, as one of a numerous class of unscientific readers and amateurs, I assure you that these scraps are extremely refreshing to us, and that we often turn to them with great satisfaction after having perplexed ourselves to very little purpose with a profound German disquisition on manure. Far be it from me to find fault with the science and philosophy of this curiously inquisitive yet matter-of-fact age; but I should be sorry to see its spirit prevail too exclusively in that pursuit which, from all times, has been so closely allied to poetry. What poet is there who has not sung of flowers? what flower that has not become more interesting from its poetical associations? To be sure, many of the recent denizens of the stove and the greenhouse present some difficulties to the bard who wishes to celebrate their beauties, and he would probably be obliged to address the fair sesquipedalians in the same manner as the poet addressed his native village with an unpronounceable name—

> "And thou, dear village! loveliest of the clime,
> Fain would I name thee—but I can't in rhyme."—

But no flower with a practicable name has ever wanted a poetical admirer,—and I believe the Sunflower would have been long since kicked out of our gardens but for the pretty poetic fiction (if you please) alluded to in your Naturalist's Corner the week before last, but which I am glad to see supported by competent authority in last week's Paper. Probably our poets are rather behind-hand in this age of discoveries; and, by way of a hint to them of the field which has been opened by recent investigations, and in order to show that "truths sublime" do not become less interesting when "married to immortal verse," I send you the inclosed lines, and remain, yours very obediently.—Q.

A SURPRISE.

I entered her gate, and I walked o'er the lawn,
  And Amanda came forward to meet me:
Her beaming blue eyes gave new life to the morn,
  As she smilingly hastened to greet me.

Said I, "Fairest maiden, wherever you pass
  All nature seems sunny and bright;
Say why, as your fairy feet trip o'er the grass,
  Does the lawn look so verdant and bright?"

"Indeed," said the maid, "I'll be candid with *you,*"
  (How, I felt my fond heart beating quicker!)
"Why Bonedust we found, Mr. Smith, wouldn't do,
  So we tried Ammoniacal Liquor."

—*Esher, Sept.* 28*th,* 1842.

Effects of Nitrate of Soda upon Cucumbers.—In the *Chronicle* of Sept. 17th I perceived, in your "Notices to Correspondents," an inquiry whether nitrate of soda had ever been used to Cucumbers or not; which question, with your permission, I will answer. I have tried it, and seen it used for three years, and I can assure your readers that no plant can be more benefited by its application than the Cucumber; since it causes the plants to assume a deeper green, and likewise assists in swelling the fruit. The quantity which I applied was about two tablespoonfuls to three gallons of water, poured upon the bed through the spout of the watering-pot without the rose. Care must be taken that the leaves are not touched by the mixture, which would undoubtedly injure them.—*John Armstrong, Belmont, near Durham.*

The Flower of Kent Apple.—I beg to inform you that I have a large tree of that old but much-neglected Apple, the true "Flower of Kent," from which fruit has this season been gathered of the extraordinary weight of 21 oz.; the average weight of each Apple, on taking the crop, was 15 oz. I write this in order to induce the public to grow that fine kitchen Apple, which, for size, quality, and keeping, cannot be surpassed.—*G. Imms, Woolwich.*

Management of Pines and Vines.—Will the author of the paper on the successful Pine growing at Thornfield favour the readers of the *Chronicle* with the system he follows, as I think his account a little mysterious if true? Some of the growers for the London market may pick up a useful idea on growing Pines (and we provincials as well). A produce of 17lb. 5oz. from a Jamaica in three years would pay, and help some of our commercial growers to keep ahead these hard times. When we get this system explained, and Mr. Roberts' "Comprehensive Practical Treatise, or a New Era in the Culture of the Vine under Glass, as to its Earlier Precocity, &c., &c.," out, we shall certainly keep up with the times. Perhaps Mr. Roberts will, at some future period, explain what he means by "Earlier Precocity."—*Inquirens.*

Cooking Potatoes for Cattle.—Having lately heard something of the superiority of roasting Potatoes to boiling or steaming them as food for cattle, I take advantage of the *Chronicle* to inquire whether any of your correspondents have made a comparative trial of these processes; and, if so, whether the result has been satisfactory. Should such have been the case, I should be glad to learn what form of machine has been found to answer, and in what manner fire has been applied.—*G. W., Liverpool.*

Difference in the boiling of Peas.—Can any of your correspondents assign the cause why Peas grown on certain soils will boil tender in a very short time, whilst the same kind sown on other soils may be boiled for hours, and still be hard enough, as the phrase is in the country, "to shoot rooks with?" The change in the nature of the soil is frequently so abrupt, that I have had one part of the produce of a field "good boilers," whilst the other part would not soften however long they might be boiled.—*Lusor.*

Sugar Beet.—On the 17th February last, among a long list of other seeds, I bought, out of curiosity, some *Sugar Beet seed* of Messrs. Warner and Co., Cornhill. Upon going yesterday to prove the growth of the crop, I desired a labourer to raise some roots in my presence, thinking, after such a glorious summer as we have this year experienced, I might well expect to get a highly saccharine product. Judge of my mortification and surprise, when the whole crop proved upon examination nothing but the *Green Beet,* abundance of which is growing in mine and most other gardens, and useful only in culinary condiments as an herb. I beg to apprise the Messrs. Warner of this inexcusable negligence through the *Chronicle,* as though my tea and coffee may not suffer by the loss of the sugar, I had experimentally hoped to have manipulated, my patience as a gardener does.—*W. Mason, Necton.*—[The kinds of Beet cultivated by the French exclusively for the production of sugar are—La jaune à chair blanche, la blanche de Prusse ou de Silésie, and la blanche à collet rose. We do not find that the green kind is employed for this purpose at all.]

Bees.—A strong swarm of bees took flight, in June 1841, from an old stock, and were safely hived in a new cottage-hive; and this summer, early in June, they showed every symptom of throwing off a swarm, but after a few days they returned into the hive, and renewed their labours. These symptoms have been repeated, at intervals, six or eight times during the season, for days together, the bees being idle and clustering about the hive, in sufficient quantity to fill a quart. Will Dr. Bevan, or some other Apiarian, kindly tell the writer the cause, and how they should be managed so as not to lose the summer?—*A Novice.*

Heating by Hot Water.—Since I sent you the brief paragraph (p. 421) on the mode of heating by hot water at Sudbury Hall in June last, Mr. Mitchell has favoured me with some remarks on the subject, from which I have made the following extract:—"My boiler contains 36 gallons of water, though a smaller size might suffice, especially where a less extent of pipe is required. The entire length of the pipe, including the flow and return pipes, is 200 feet, and can be heated throughout in one hour from the time the fire is lighted. I reared my succession Pines in the pits heated thus, all winter; which latter are now replenished with Cucumbers and Melons, growing vigourously. It is more than 12 months since I commenced the plan. The size of the pipes, or rather tiles, is four inches across the top and three and a quarter inches deep, internal measure."—*J. Murray.*

Conical Boilers.—In your Paper of Saturday last, under the head of "Garden Memoranda," a description is given of Shewen's boilers, which are stated to be a great improvement upon those originally introduced by Mr. Rogers. We beg to say, that the form lately adopted by Mr. Shewen for his boilers is an exact copy of the Improved Conical Boiler, advertised by us in the *Gardeners' Chronicle* from its commencement, and which you described in your Paper of March 12, p. 175. As we have made these boilers in copper and iron for many years, and have supplied them all over the country, we think it due to us, that whatever merit appertains to this peculiar form, should be ascribed to the proper channel. Mr. Rogers, who favoured us with a visit sometime since, was pleased to express his approval of the alteration we had made in his original invention.—*Stephenson and Co.* [We have examined the boiler referred to by Messrs. Stephenson and Co., and do not perceive that those now erecting by Mr. Shewen are different from it.]

Influence of Soil on the Colour of the Hydrángea.—There is no doubt that the colour of the blooms of the Hydrángea depends on the soil, as I have proved in the following manner:—Some years ago I planted Hydrángeas that had always produced rose-coloured blossoms, in a bed composed solely of the black peaty soil from the surface of the hills of Glamorganshire. They blossomed the next season of a fine blue colour, and have continued to do so most luxuriantly for the last six years. I took some cuttings from these plants, and planted them in soil from the alluvial marshes near the Severn, the blossoms have again returned to the original rose colour.—*Lusor.*

Autumn-blooming Flowers.—If your correspondent "Inquirens" will plant the Persian Ranunculus in May or June, he will have a show of blooms in the autumn nearly equal to the spring-planted ones; and I have been informed that the blooming of many Roses may be procrastinated for a month or two by late planting, and by gathering the first buds as fast as they appear.—*Lusor.*

Vegetation of Affghanistan.—The vegetation of this country is typified by its Thistles, thorny Astrágali, Státices, and Siléneæ, and by their habits of isolation. Nothing can be plainer than that the Indus is the political, botanical, and zoological boundary of India.—*M. H.*

PROCEEDINGS OF SOCIETIES.

FLORICULTURAL SOCIETY.

Sept. 27.—Mr. Bragg in the chair. An unusually large quantity of Seedling Dahlias, both of 1841 and 1842, were brought for the opinion of the Society. A statement of the merits of the Dahlias exhibited has been sent to us by the Society, but we can only find room for the judgment passed upon first-class flowers. In our opinion, considering the great quantity of Dahlias now in cultivation, no variety below the first class deserves any mention whatever. Mr. Mountjoy, of Ealing, sent eight blooms of Virgil, which supports its general character as a first-rate flower. From Mr. Bragg, of Slough, were six blooms of Antagonist, 1841; colour, white; form, substance, and arrangement good; in general the eye is sunk; but one specimen, which had not this defect, was a first-rate flower. Mr. Smith, of Hackney, sent seven blooms of Bianca, 1841; colour, white; form, substance, arrangement, and eye good; depth full, and size medium; a first-class flower. 12 blooms of Turville's Essex Triumphant were exhibited, which fully maintains the high character which has been given to it in former Numbers of our paper.

It was agreed that a special meeting should be convened on Tuesday evening next, at 6 o'clock, to take into consideration the conduct of Messrs. Brown and Atwell, of Uxbridge, in "endeavouring to defraud the Society at the Exhibition of the 20th instant, by removing the centre of one of the blooms in a stand of 36, and replacing it with a partially expanded flower:" and also that of Messrs. Tyler, "for grossly misconducting themselves towards the Secretary at the same meeting."

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Maxillaria acutipe'tala. Sharp-petalled Maxillária. (*Stove Epiphyte.*) Orchidáceæ. Gynándria Monándria.—This handsome plant was sent to the Royal Gardens at Kew, by Mr. Barclay, who found it in Central America. It produces its very prettily-marked blossoms in March and April; these are pale orange, spotted and blotched with blood colour. The column is reddish purple. The pseudo-bulbs are clustered, oblong-ovate, deeply furrowed, with prominent angles; the younger ones are clothed with brown acuminated scales.—*Curtis's Bot. Reg.*

Combretum grandiflorum. Large-flowered Combretum. (*Stove Climbers*). Combretáceæ. Octándria Monogýnia.—Although introduced from Sierra Leone so long since as 1824, yet it is only of late that it has been met with in a flowering condition. It does not possess that copiousness of inflorescence which is apparent in the freely-branching and elegant spikes of C. purpúreum; but its habit and foliage are rather superior to those of that plant, and the peculiarity in its mode of flowering must be considered a recommendation, inasmuch as it affords an essential variety in a collection of Stove climbers. Its growth is somewhat freer than that of the plant just named, its leaves are a trifle larger and better, and the young branches have a more elegant, graceful, and wavy aspect. The blossoms are arranged in altogether a different form, issuing from both sides of the principal stalk; their short pedicels curve upwards, so as to give them the appearance of two rows of flowers, placed side by side, on the upper surface of the spike. Their closeness, too, prevents them from expanding much; and though they are in themselves really large, they do not occupy a great space. It ought to have a compost of good loam, leaf-soil, and heath-mould, with a little sand; the two former should constitute the body of it. An Orchidaceous house, which is kept warm and moist, would be an excellent situation for this plant and C. purpúreum. They may be both propagated by cuttings.—*Paxton's Bot. Mag.*

La'lage Hoveæfo'lia. Hovea-like leaved Lalage. (*Greenhouse Shrub.*) Leguminosæ. Monadélphia Decándria.—This pretty species flowered with Mr. Low, of Clapton, last February. The flowers are of a clearer yellow tint than those of L. ornata, and the wings and keel have a pleasing purplish hue instead of a dusky brown. But it wants the close and erect habit of its ally, and is apt to attain a disagreeable laxness. The foliage and branches are clothed with a weak but very perceptible down; the flowers are axillary and by no means lacking in ornament. To cultivate the plant favourably it must be potted in light loam, with which a small portion of heath-mould may be mixed. The shoots should be stopped occasionally while they are growing, in order to make the specimen bushy, and to hinder its branches from straggling too much. It should always be kept in a very light and airy part of the greenhouse, and carefully watered only when it really needs it. It may easily be increased by cuttings. —*Paxton's Bot. Mag:*

MISCELLANEOUS.

Sugar produced from the Peelings of Figs.—M. Germain, a botanist of Algiers, states that a curious discovery has been made by General Lamoricière, which may prove important in a commercial point of view to the colony. The General, seeing a quantity of Fig-peelings thrown about the streets of Mascara, thought they might prove prejudicial to the public health, and ordered them to be collected together and thrown in a heap outside the town. Some days afterwards, in passing the same way, he perceived some white substance lying on the heap. On examining this, he found it was a sort of sugar, which the Fig-peelings had produced, from the heat of the sun causing fermentation in the heap. These Figs are of such slight value, that a pound of the sugar can, it is calculated, be produced for four sous. All that is required is, to divide the fruit in two, and expose it to the rays of the sun, and then take off the efflorescence with a soft brush. It is said also that orders have been given to the colonists to plant the Cactus, or Barbary Fig-tree, wherever they can, and that soldiers are to be sent out to cover a part of the plain of the Metidja with Cacti. This operation will be of easy execution, as it is quite sufficient to let one of the shoots enter the ground to have vigorous roots immediately emitted. The saccharine matter of this Fig is described as identical with that of the Sugar-cane—namely, purely crystallisable.—*Times.*

New Fowling-piece.—M. Arago laid before the Parisian Academy two fowling-pieces, the invention of M. P. Matthieu, which are stated to possess the following advantages:—After each discharge the gun immediately recocks itself, and a new charge is conveyed in the direction of the barrel. This is repeated five or six times, and with such rapidity that the gun can be discharged five times in three seconds. If the sportsman does not wish to fire with this rapidity, he can stop the action, and wait any time he pleases between each discharge. M. Arago stated that the combinations of the mechanism were such as to prevent accidental explosion. This invention is not new. Baron Heurteloup, more than two years ago, produced a fowling-piece and a musket on this principle; and, according to report, he has made such improvements that double the number of charges of M. Matthieu's gun may be fired in almost the same space of time.

Regent's Park Gardeners' Society for Mutual Instruction.—From a circular which we have received, we learn that a Gardeners' Society for mutual instruction has been established in the Regent's Park; the objects of which institution are—to disseminate general information on horticultural matters, by introducing at their meetings short treatises upon subjects interesting to the members, and by the after-discussion of such subjects as may be thus brought forward. Opportunities will also be afforded to the members of obtaining the names of such plants as they may be unacquainted with. The meetings will be held every Thursday evening at the Jew's Harp Tavern, Regent's Park.

Treatment of the Willow in Ladakh.—The only timber trees found in Ladakh are the Willow and Poplar, and chiefly the former. In order to render it more productive of branches, required for fuel, for roofing, for baskets, and other wicker-work, the natives adopt a method of treating the trees which renders its growth singularly luxuriant. Willow staves from pollard heads, about two inches in diameter and ten feet long, from which the leading and side shoots have been cut, have their butt ends immersed in water until they throw out root fibres; three of them are put into the ground on the edge of a natural or artificial water-course, bound together with grass. After three years a broad strip of bark is torn from each, from about a man's height down to the ground, and notches are cut in the wood and bark commonly on the opposite side, to form a ladder, by which a man may climb up the tree. As the wood which has been laid bare dries, it is chipped off, and this operation is repeated until the tree is little more than a hollow cylinder of bark, lined with a thin layer of wood. The tree thus contributes from its substance a supply of fuel, and at the same time the branches from its head are multiplied. The first-formed or oldest branches being but feebly supported, bend outwards, and sometimes, in a slight degree, downwards, and from their upper surface springs a crop of perpendicular shoots, greatly exceeding that of the heads of common Pollards.—*Moorcroft's Travels*, vol. i., p. 307.

Experiments with Gas-water, &c.—In a letter from Sir J. M. Tylden to the Editor of the "Mark-Lane Express" is an account of an experiment upon April Wheat, from which we extract the following: "I selected two perches of similar ground, adjoining each other, the soil of which was, to the depth of six inches, made up from an old bank, brought to cover a stiff, loamy, brick earth. It had a good crop of Mangel Wurzel upon it the previous autumn. No. 1 was manured with half of the following compost:—One gallon of ammoniacal gas-water, half a bushel of saw-dust, coal ashes and gypsum sufficient to fix the ammonia, half a pint of gas-tar, one pound of nitrate of soda, and four barrow-loads of poor rubbishy turf and weeds. In about three weeks the gas-water had decomposed this mass; half of it was dug in on No. 1, a few days before the Wheat was planted. On No. 2 no manure of any kind was put. The Wheat was dibbled in rows six inches apart, and the same distance in the rows, one or two grains at a place. Both perches came up quickly and grew well, No. 1 being stronger, and of a deeper green. In a few days No. 2 was much eaten by the wire-worm, which destroyed nearly half, whilst No. 1 was scarcely touched; and I think, if I had applied all the compost, not a grain would have been eaten. The Wheat grew rapidly, No. 1 keeping the lead, and promising a heavy crop. It came into ear on the 23d of June, and both were harvested on the 15th of August, and thrashed out soon after. No. 1 yielded one gallon, two quarts; and No. 2 three quarts, one pint. I am disappointed with this kind of Wheat, as its appearance previously to coming into ear, combined with its rapid growth, led me to expect better things; but I am agreeably surprised at the result of the compost, which appears to destroy the wire-worm at a trifling expense, for the *whole* of my mixture did not cost 4*d*., and, if made in large quantities, it would be much cheaper. From what I have heard of 'Daniell's Manure' I imagine it to be nearly similar to mine."

Botanical Prize-Men—At the recent examination in Botany at Apothecaries' Hall, the gold medal was awarded to Mr. J. E. Stocks, the silver medal and books to Mr. J. Huxley, and the silver medal to Mr. A. Jackson, all students of University College, London.

Cheap Food for Horses.—A proposition has been made to the French Minister of War by a M. Longchamp, to try a new method of feeding horses, which he asserts will produce a vast saving in the amount of forage necessary for the army. This gentleman proposes to make a sort of bread, three-fourths Potatoes and the rest Oatmeal, with which the horses are to be fed in place of Oats. The average quantity of Oats for a horse per day, M. Longchamp estimates to be 10 lb., costing about 13 sous. He proposes to replace this food by 10 lb. of the bread made with Oats and Potatoes, the price of which will be only 5 sous, leaving a saving of 8 sous a day. As there are 80,000 horses in the army, a saving would arise on the whole of the cavalry of 11,680,000 fr. a year. M. Longchamp considers this food to be more nutritious than the food generally given to horses, for a great portion of the Oats taken by a horse are imperfectly masticated, and therefore the nutritive qualities are allowed to remain latent. Heat and moisture, he declares, are necessary to bring forth fully the qualities of the fecula of Oats, and this can be procured most effectually by subjecting it to the heat of an oven, after having been moistened and well mixed up. Cakes of this kind have been long used in Holland with profit; and M. Longchamp expresses his surprise that Potato-flour has not been more commonly and openly mixed with bread; bakers, he says, being in the habit of using it. But this is not the only advantage to be gained by this proposition. A hectare of Oats (2½ acres) is worth about 92 fr., whilst one of Potatoes produces 240 fr. M. Longchamp thinks that if one-third of the land at present under cultivation for Oats were planted with Potatoes, five times a greater quantity of cattle could be bred in France. By this means butchers' meat would become cheaper, and be within the reach of the generality of the inhabitants of the kingdom. The more generous diet thus procured would have a considerable influence, M. Longchamp declares, on the average height of the natives of France, which the recruitment of the army proves to be each year decreasing in stature.

THE NATURALIST'S CORNER.—No. III.

(Continued from p. 640.)

11. The Plantain, *Musa sapientum*, produces a fruit which is used to a prodigious extent by the inhabitants of the torrid zone; and, from its nutritious qualities and general use, it may, whether in a raw or dressed form, be regarded rather as a necessary article of food than as an occasional luxury. In equinoctial Asia and America, in tropical Africa, in the islands of the Atlantic and Pacific Oceans, wherever the mean heat of the year exceeds 24 centigrade degrees (75 deg. Fahrenheit), the Plantain is one of the most interesting objects of cultivation for the subsistence of man. It is, indeed, often the whole support of an Indian family. The fruit is produced from among the immense leaves in bunches, weighing 30, 60, and 80 lbs., of various colours, and in great diversity of form. The Banana of hot countries is a mere variety of the Plantain, distinguished by being dwarf, with a spotted stem, and a more delicate fruit. Botanists call it *Musa paradisiaca*, in allusion to an old notion, that it was the forbidden fruit of Scripture.

12. The Heath, so common in the northern parts of this kingdom, valuable alike to the poor as a substitute for more expensive fuel, and to the sportsman as a cover for grouse, affords to the Botanist a striking instance of the care of Providence towards his creatures. Its seed is the food of numerous birds, in regions where other sustenance is scarce; and the vessels which contain it are so constructed as to retain their contents for a considerable length of time, instead of discharging them when they become ripe. Indeed, the more we study and the closer we observe the operations and provisions of Nature, the greater will be our wonder, the higher our admiration.

> "There is a lesson in each flower,
> A story in each stream and bower;
> On every herb on which you tread
> Are written words which, rightly read,'
> Will lead you from earth's fragrant sod
> To hope, and holiness, and God."

13. Russia Leather derives its peculiar odour from an empyreumatic oil, which is obtained from the bark of the common or white Birch-tree, *Betula alba*, and which the Russians employ in tanning.

14. Dionysius, the geographer, compares the form of the Morea, or ancient Peloponnesus, to the leaf of the Plane-tree, making the footstalk to be the isthmus by which it is joined to Greece. Pliny also says, the Peloponnesus is shaped, by the number of its bays, like a Plane-leaf. Professor Martyn, in his notes to the Georgics of Virgil, observes of this similitude, that it is as just as we can expect in anything of this nature; and to illustrate it, he has given a figure of the Peloponnesus, and of the leaf of the Plane-tree on the same page in his pictorial embellishments.

GARDEN MEMORANDA.

Royal Botanic Gardens, Kew.—Since our last visit, many of the contemplated alterations have been completed. A new span-roofed house has been erected for the cultivation of Cacti, and other succulent plants, of which there is an extensive collection, including many of enormous size. A large specimen of Melocactus communis, and several Mammillárias, are in bloom, with numerous Gastérias, Hawórthias, and other plants, closely allied to the Aloe. Adjoining this house is the Heathery, also span-roofed, which is a neat little building, containing a tolerably good assortment of this beautiful tribe. Amongst them we noticed Erica grácilis autumnalis, a small but very showy variety, with deep rosy purple flowers; E. colorans, which is pure white at its first expansion, but afterwards changes to a deep red; E. gnaphalioides, resembling E. bruniades in being covered with a thick pubescence, but with less conspicuous flowers than that variety; the pretty little E. triceps, with E. exurgens, formosa, and many others. Against the west side of the Heathery a small range of glass is constructed for the cultivation of Íxias, Gladíoli, and other Cape bulbs. The Orangery has been decorated and refitted; three ventilators have been formed at the back, for the better admission of air: and large portions of each end of the house, which were formerly solid walls, have been converted into the principal glazed entrances to the building, giving it altogether a much lighter appearance. What was originally the great Greenhouse, is now appropriated to the growth of various species of Euphórbia, Zámia, Agave, Córypha, and other large plants requiring a temperature ranging between that of the Greenhouse and a dry Stove. This building is heated by hot water upon Perkins' system, by means of which a sufficient temperature is attained: but the apparatus is frequently out of order. This house contains magnificent specimens of Euphórbia grandidens, and Zámia pungens: the former throwing out large branches in all directions—the leaves of the latter drooping gracefully around the tub to within a short distance of the ground. The Bánksia house contains a large erect-growing plant of Drimys Winteri, or the Winter's bark-tree, at least 11 ft. high, and fine young trees of Dámmara australis, Phyllocladus trichomanoides, and Dacrýdium cupressinum, presented by Capt. Symonds, R N. Several of the Bánksias are producing their singular cylindrical or globose heads of bloom; and Anadenia Manglésii here flowers almost all the year round. A new double span-roofed house is devoted to the rearing of tender Tropical plants, from cuttings and seeds. In the Orchidaceous house two varieties of Epidendrum ciliare are in flower, one being much larger and more inclining to a yellow colour than the other. The graceful Oncídium ornithorhynchum and Cypripédium insigne are coming into bloom, as well as a species of Catasetum lately purchased of Mr. Skinner. Maxillária rufescens and Epidendrum umbellatum are blossoming freely: with several species of Polystáchya, the flowers of which are very diminutive, and of a greenish yellow colour. Cestrum nocturnum, just expanding its greenish night-smelling blossoms, is flowering in front of the Fernery, and by its side large plants of Bignónia grandiflora, and of the beautiful Poinciana Gilliésii, which have been blooming throughout the summer; all of them being slightly protected during winter. Where practicable, the plants in the houses are ranged according to their natural orders; but as this requires a greater space than can be spared for the purpose at present, it is in many cases dispensed with.—*R. A., Sept.* 19.

Review.

Proceedings of the Horticultural Society of London.

No. XVI.

This part of the Society's Proceedings embraces the period between June 12 and Nov. 2, 1841. A novel feature in it is the introduction of extracts from the monthly reports made in the Garden to the Garden Committee. We select some passages relating to matters of practical importance.

"July 5, 1841.—Mr. Thompson reported from the Orchard and Kitchen Garden Department, that a plant of Seakale, mentioned in the last report as having had a pound of undissolved nitrate of soda strewed over its foliage, has since proved uninjured. Thus, whilst some species of plants are destroyed by a small quantity of this salt, the Seakale, and the Cabbage tribe generally, appear to be proof against its destructive effects. Chloride of lime has been tried unsuccessfully against the American blight on trees; the glaucous, woolly covering of the aphis proving a complete protection. The same tree was syringed with a solution of half a pound of potash, with very little effect on the insects beyond the mechanical removal of such of them as were not well secured in crevices of the bark.

"August 2, 1841.—Ammoniacal liquor from the gas-works had been employed by Mr. Thompson against the American blight on Apple Trees, diluted with about two parts of water; but it had not in that state proved effectual.

"Some experiments have been in progress since the beginning of February, under the direction of Mr. Fortune, to ascertain what effects would be produced upon Pelargoniums by watering them with small quantities of different salts dissolved in rain-water. At the commencement of the experiment the roots of the plants were washed clean, to remove all the soil in which they had been growing, and were then potted in silver-sand. By this means they would depend chiefly for nourishment upon the substances dissolved in the water, and it would then be seen whether these of themselves were sufficient for their support. Mr. Fortune says—'The salts were carbonate of ammonia, sub-carbonate of soda, sal-ammoniac, common salt, saltpetre, nitrate of soda, and carbonate of ammonia, mixed with wood ashes. About two tea-spoons full of salt to each gallon of rain-water was the strength of each solution. The plants were then divided into sets of three each, which were watered with the different salts whenever the sand was dry.

"'Other two sets of Pelargoniums, planted in sand in the same manner as the others, were watered with rain-water mixed with the ammoniacal liquor of the gas-works in the proportion of about half a pint to a gallon. In one of the sets the liquor was used fresh from the cask, in the other it had been exposed for some time to the action of the air.'

"The result of these trials seems to be, that none of these substances of themselves will support plants of this kind in a healthy condition. Carbonate of ammonia with wood-ashes was the most beneficial, and the subcarbonate, the carbonate, and common salt, did not seem to produce any bad effects, as the plants here grew as well as some which were watered with pure rain-water. The remainder of the salts and the two kinds of ammoniacal liquor were certainly injurious.

"Three plants of the same kind were potted in burnt clay, three in pounded bricks, and three in charcoal, and all were watered with pure rain-water. In these circumstances they grew better than any of the others, except those in the carbonate of ammonia and wood-ashes; the two first, however, succeeding better than the last, which was in charcoal: but none of them did so well as some others which were in common garden soil. These results were evidently for want of sufficient nourishment, in so far as the burnt clay and powdered bricks were concerned; the charcoal might produce other effects, but other experiments are still going on with this substance.

"I have also been trying what effects would be pro duced upon Pelargoniums growing in common soil by watering them with carbonate of ammonia, nitrate of soda, and Glauber's salts dissolved in rain-water. The proportions of the salts were rather greater than in the first instance. Each plant which was watered with the salt was placed by the side of another of the same variety, which was watered with pure rain-water. The difference between the plants watered with the salt in solution and the others was very apparent, the former being shorter jointed, having their leaves of a deeper green, and having more of the brown colouring matter in the stems. It is necessary, however, to use the nitrate of soda with great caution, as in proportions a little greater than here used it will destroy the plants. All the three salts produced the same effects—at least I could discern no difference."

At the meeting held on the 5th of October there were exhibited from John Williams, Esq., of Pitmaston, several Melons ripened in an open-sided frame, in front of which screens of fly-wire, painted black, had been placed in an inclined position; the rays of the sun, falling directly upon these screens, heated them to a temperature exceeding 90°, and the air in passing through the interstices of the wire raised the heat of the interior of the frame many degrees higher than it otherwise would have been. Also from Mr. H. Silverlock, F.H.S., of Chichester, a bunch of Black Hamburgh Grapes, cut from a Vine twelve years old, which had never before produced good fruit. In the early part of the spring the main stem was sawed nearly through, the only nourishment being conveyed to the upper branches through the inner bark. The Vine broke in due season, and produced sixty bunches, equal to the one exhibited.

CALENDAR OF OPERATIONS *for the ensuing week.*

Last spring we recommended *straw* in preference to the bast mats in common use for covering pits and frames in cold weather; and as the season is approaching when such additional shelter will be generally needed, we would again advocate the great superiority of the former material. Straw mats might be made in different ways to suit the particular purpose for which they are intended. If to cover pits, in which a high night temperature is maintained, the straw should be laid upon a framework of wood, so contrived as to leave a space of a couple of inches between the straw and the sashes. The stratum of still air thus confined in contact with the glass lessens very materially its radiation of heat: this, therefore, is the most efficient method of making the coverings; but, at the same time, when the pits are wide, the large size of the mats required makes them unwieldy and inconvenient to put on and off. A more manageable form is that of the reed mats, which are sometimes used for a similar purpose; but as these lie close upon the glass, they do not so effectually prevent the escape of heat. It would be difficult to explain by writing, so as to make it intelligible, the method of making these coverings; however, any person of a little ingenuity could easily contrive something of the kind which would be much superior to bast mats. The straw might be prepared (that is, drawn straight) by women, and the mats made by the men on wet days.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—In many families, Pine-apples are of greater value during the ensuing three months than at any other season of the year. As light and natural warmth decrease, so also will the flavour of fruit: therefore, the practice formerly mentioned, of removing ripening fruit to a dry and airy situation, should be strictly followed. Growing fruit must be encouraged to swell by a warm and humid atmosphere. Water these with liquid manure occasionally, but be moderate in its use, for more harm than good is sometimes done by giving this indiscreetly to plants which do not want it. The suckers and crowns that are now taken off, after the necessary trimming and drying of the bottoms, may be stuck into the bark-bed to strike root. Watch the linings of dung-heated pits; heavy rains may cause them to heat irregularly. By covering the glass in the way above described, both firing and labour will be saved.

Vinery.—Fires will frequently be necessary now to dry the air in the late houses; for if a disposition to decay is once induced in the skin by damp, no after care can preserve the fruit. Should the sashes have been taken off the early house, they may now be replaced; but take care to give plenty of air both by day and night, for habit having made these Vines excitable, the increase of temperature which would arise from keeping the house too close might possibly cause the buds to break.

Peach-House.—Continue all requisite attention to the trees in the late house. With a view of ripening the wood perfectly, some cultivators apply fire-heat to the latest-forced trees until the leaves fall; however, except in very cold and wet seasons, or late districts, it is questionable whether the benefit derived from this practice is equivalent to the extra expense.

Cucumbers and Melons.—After this time of the year Melons are not generally accounted of much value; but where they are in request till a late period, the plants must now be well attended to, particularly in regard to moisture, too much of which would be fatal to them. Give water only when absolutely necessary, and every day let the plants have air enough to dry them. Growing Cucumber plants will take more water; but there must also be a brisk heat maintained. Those in pots or boxes will perhaps require a light top-dressing of soil, a small quantity of which should be laid on whenever the young roots appear at the surface. Red spider must be anxiously guarded against by every available means.

Kidney-Beans.—Thin the young plants if they are too thick, and set them near the glass, that they may not get long-legged. If you have convenience to grow a constant succession, sow again.

Out-door Department.

Asparagus.—The tops, being no longer of use, should be cut off with a scythe, and the beds cleared of weeds. After saving what seed is wanted, the tops may be preserved for covering wall Fig-trees in winter, or any other useful purpose.

Cabbages.—Draw a little earth round the stems of all that have been planted out, to prevent rough winds from loosening them at the root.

Cardoons.—Tie up and earth when they are dry.

Endive.—Continue to blanch accordingly as it is required for use.

Oxalis Deppei.—The bulbs of this new culinary plant must be taken up as soon as they are sufficiently ripe. (See page 68 of last year's *Chronicle*.)

Parsneps.—Any time when the ground is not wet, these should be dug up and stacked under cover, like Carrots, for winter use. There is not a more slovenly practice than that sometimes followed, of leaving these and similar roots in the ground all winter, to be taken up in rain, frost, or snow, as wanted.

Radishes.—Make another small sowing in a vacant frame.

Orchard.—All the small-growing fruit-trees, as Gooseberries, Currants, and Raspberries, may be planted with advantage now, or any time in this month. Bearing trees of the two first might be removed, if properly done, without the loss of next year's crop. These may also be pruned whenever time permits, and cuttings of the best sorts planted. Autumn is the best season to manure unproductive Strawberry plants; but the most economical system is, to plant a certain portion of ground every year, and to destroy the same quantity of the oldest beds. Continue the gathering of orchard fruit. Some maintain that it is no way detrimental to the keeping of fruit to gather it when wet—and this deserves a trial, because in stormy autumns much of the finest fruit is blown down and damaged while waiting for dry weather to gather it.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Such plants as Sinníngias and Gloxínias, which are now resting, must be kept perfectly dry. Things which have been propagated during the summer, and which have been standing amongst the young Greenhouse plants, must be got together and placed in a situation where more heat can be given. Shut the ventilators early in the afternoon, and light gentle fires in the evening; the late cold, wet weather renders this advisable. Take care, however, not to raise the temperature higher at night than during the day.

Greenhouse and Conservatory.—In finally arranging the plants for winter, let all those which are technically called "hard-wooded" occupy one house, if there are two Greenhouses; while Pelargóniums, Calceolárias, and other less hardy plants, should be placed together, where they can be kept a little warmer. Where there is only one Greenhouse, all that can be done is to set the best plants in the best places; but hard and soft-wooded plants do not assort well together in winter. Let dead leaves and flowers be daily cut off, and general neatness be particularly attended to. Flowering plants of the Cactus tribe should be set together at the back of any of the houses where they can be kept quite dry; but any of those whose buds are advancing may be forwarded for early blooming. Plants that are not large enough to flower should be watered and kept growing.

Pits and Frames.—Bulbs of all the kinds that are usually forced should be procured and potted for that purpose. Of these, the principal part ought to consist of Hyacinths and Narcissi, because they are sweet as well as beautiful; while scentless flowers, as Tulips and Crocuses, have only one of those qualities to recommend them. Light sandy soil is suitable for the whole. Hyacinths can be successfully flowered in pots, firmly filled with green moss, in which material they are better adapted for setting on stands in rooms, than when growing in a heavy mass of soil. After potting they may be set in a vacant frame, or plunged in coal-ashes out of doors till wanted.

Out-door Department.

Worms now make lawns unsightly by their casts. A good watering with lime-water will bring all that are within its reach to the surface, when a second application will destroy them. Afterwards sweep and roll the turf. If Gladíolus roots are intended to be taken out of the ground to winter, it should now be done. Tiger Lilies, and other species that are perfectly dormant, may be divided and replanted. Plant bulbs of the English Iris; the Spanish might be kept out of the ground two or three weeks longer, because it comes up sooner than the other.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Seedling beds, in which the plants are too small for removal, ought to be properly weeded and cleaned before winter. Trench and prepare ground for the reception of tree-seeds which it is intended to sow before winter.

Forest and Coppice Woods.—Before the general planting of timber-trees is begun, see that all watercourses, ditches, and drains are in good order. Inattention to this sometimes causes great delay in planting, by keeping the ground in a wet state longer than it would otherwise be.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending Sept. 29, 1842, as observed at the Horticultural Garden, Chiswick.

Sept.	Barometer.		Thermometer.			Wind.	Rain.

The highest temperature during the above period occurred on the 5th, in 1834—thermometer 80°; and the lowest on the 5th, and 6th in 1826—thermometer 29°.

REPORT ON COVENT GARDEN MARKET,

For the week ending Sept. 30, 1842.

The supplies of both fruit and vegetables have been very good during the past week, but trade is not at all brisk. *Fruit.*—Pines, principally Queens, are plentiful from 3*s.* to 5*s.* per lb. Grapes are remarkably cheap; good Black Hamburghs may be obtained from 1*s.* 6*d.* to 2*s.* per lb.; and Muscats at 2*s.* 6*d.* per lb. English Melons are becoming scarce; the few remaining fetch from 1*s.* 6*d.* to 2*s* 6*d.* each; the Dutch kinds are also far from plentiful. The Peaches offered are, in general, good, from 6*s.* to 8*s.* per doz.; but these as well as Plums are far from being abundant. There are still a few samples of Coe's Golden Drop, at 1*s.* 6*d.* per punnet; those of the Imperatrice are more numerous, at 1*s.* per punnet. The supply of Figs is nearly over. A great variety of Pears are offered; the small Autumn Bergamot has advanced in price to 5*s.* and 8*s.* per half-sieve; Gansell's Bergamot fetches 2*s.* per dozen; Marie Louise, from 1*s.* to 1*s.* 6*d.* per dozen, and the Brown Beurré from 2*s.* 6*d* to 3*s.* 6*d.* per half-sieve. Amongst the Apples we observed some excellent Ribstone Pippins, from 4*s.* 6*d.* to 5*s.* per bushel, and a large quantity of Blenheim Orange from 2*s.* 6*d.* to 3*s.* 6*d.* per bushel. English Walnuts are daily becoming more abundant, and fetch from 3*s.* 6*d.* to 5*s.* 6*d.* per bushel. The supply of Cucumbers is rather limited; the frame fruit is selling from 3*s.* to 4*s.* per dozen; those of out-door growth from 6*d.* to 8*d.* per dozen. *Vegetables.*—Broccoli is tolerably abundant, and the quality is much improved of late. French Beans have risen in price and fetch from 3*s.* to 3*s.* 6*d.* per half-sieve. Scarlet Runners are more plentiful, at 1*s.* 3*d.* and 1*s.* 6*d.* per half-sieve. The greater part of the Turnips brought to market are excellent, from 2*s.* to 3*s.* per dozen bunches. Celery is likewise good, and not in the least worm-eaten. Jerusalem Artichokes may be obtained from 1*s.* 6*d.* to 2*s.* per half-sieve. Tomatoes continue plentiful from 2*s.* 6*d.* to 3*s.* per half-sieve. Mushrooms of in-door growth fetch from 1*s.* to 1*s.* 3*d.* per pottle; those from the fields 5*s.* and 6*s.* per bushel. *Flowers.*—The cut flowers consist principally of Ericas, Asters, Dahlias, Pinks, China Roses, Cinerárias, and Delphíniums, with a few Caméllias.

PRICES, Saturday, Oct. 1, 1842.—FRUITS:—

Pine Apple, per lb. 3*s* to 5*s*
Grapes, per pound, 1*s* to 2*s*
— Muscats, per pound, 2*s* 6*d*
— Spanish, 1*s* to 1*s* 6*d*
— Portugal 1*s* to 2*s*
Melons, English, each, 1*s* 6*d* to 2*s* 6*d*
— Dutch, 9*d* to 1*s* 6*d*
Peaches, per doz. 6*s* to 8*s*
Plums, dessert, per punnet, 1*s* to 1*s* 6*d*
Damsons, per hf. sieve, 2*s* 6*d* to 3*s*
Apples, dessert, per bush., 2*s* to 6*s*
— Kitchen, 2*s* to 3*s* 6*d*
Pears, dessert, per hf.-sieve, 2*s* to 5*s*
Berberries, per hf.-sieve, 4*s*
Cucumbers, per doz., 1*s* to 4*s*
Oranges, per doz., 1*s* to 3*s*
— per 100, 5*s* to 20*s*
Lemons, per doz. 1*s* 3*d* to 2*s*
— per 100, 10*s* to 20*s*
Almonds, perpeck, 7*s*
Sweet Almonds, per pound, 3*s*
Filberts, English, per 100 lbs. 60*s* to 70*s*
Walnuts, Shelled, per bush., 12*s* to 24*s*
Nuts, per bushel—
— Brazil, 20*s*
— Barcelona, 24*s*

VEGETABLES.

Cabbage, per doz. 10*d* to 1*s*
— plants, per doz. 1*s* 6*d* to 2*s*
— Red, for pickling, 1*s* 6*d* to 2*s* 6*d*
Brussels Sprouts, per hf.-sv. 1*s* 6*d* to 2*s*
Broccoli, per bunch, 10*d* to 1*s*
Cauliflowers, per doz., 4*s* to 6*s*
Beans, Kidney, per hf. sv., 2*s* 6*d* to 3*s* 6*d*
— Scarlet, per hf.-sv. 1*s* 3*d* to 1*s* 6*d*
Potatoes, per ton, 40*s* to 70*s*
— per cwt. 2*s* to 3*s* 6*d*
— per bushel, 1*s* 6*d* to 2*s* 6*d*
— Kidney, per bu., 2*s* to 2*s* 6*d*
Jerusalem Artichokes, per half-sieve, 1*s* 6*d* to 2*s*
Turnips, per doz bun., 2*s* to 3*s*
Carrots, per doz. bun., 4*s*
Red Beet, per dozen, 6*d* to 1*s*
Parsneps, per bunch, 6*d*
Horse Radish, per bundle, 2*s* to 5*s*
Radish, per doz. hands (24 to 30 each) 9*d* to 1*s*
— Turnip, p. doz. bch., 9*d* to 1*s*
Spinach, per sieve, 1*s* 3*d* to 1*s* 6*d*
Leeks, per doz. bun., 1*s* 9*d* to 2*s*
Shallots, per lb., 8*d* to 1*s*
Onions, per bushel, 3*s* to 4*s*
— Green, p. doz. bun 3*s* to 4*s*
— Spanish, per doz. 1*s* 6*d* to 6*s*
— for Pickl., per hf.-sv. 2*s* 6*d* to 3*s* 6*d*
Garlic, per lb. 4*d* to 8*d*
Lettuce, Cabbage, p. sc., 1*s* 3*d* to 1*s* 6*d*
— Cos, 1*s* to 1*s* 3*d*
Endive, per score, 1*s* 3*d* to 1*s* 6*d*
Celery, p. bd., red (12 to 15) 1*s* 6*d* to 1*s* 9*d*
— White 9*d* to 1*s*
Small Salads, per punnet, 2*d* to 3*d*
Watercress, per doz. sm. bun. 4*d* to 6*d*
Parsley, per doz. bun., 2*s* to 2*s* 6*d*
Tarragon, per doz. bun., 2*s* to 3*s*
Mint, per doz. bunches, 2*s*
Basil, per doz. bunches, 3*s* to 4*s*
Vegetable Marrow, per doz., 6*d* to 8*d*
Tomatoes, per hf. sv. 2*s* 6*d* to 3*s*
Capsicums, green, per 100, 9*d* to 1*s* 3*d*
— Ripe, 3*s* 6*d* to 4*s*
Mushrooms, per pottle, 1*s* to 1*s* 3*d*
— Field, per bus., 5*s* to 6*s*

Notices to Correspondents.

H. R. M.—Hollyhocks which have flowered for the first time this autumn may be allowed to remain; they will flower well next year. Seedling Pelargoniums which have grown luxuriantly, and have not flowered, will bloom sooner if not cut down.—‡

W. D.—There is no probability of your preserving Pelargoniums through the winter in the open border by covering them with litter. The damp alone would be sufficient to destroy them. Your only plan is to take them up, and plant or repot them, and keep them where they will be protected from frost; or to leave them in the ground to perish, and to purchase a fresh lot in the spring, which may be done at a very trifling expense. The Pear called the "Little Old Bergamy" is the Autumn Bergamot, a variety of very old standing in English gardens. It is different from the Bergamotte d'Automne of the French.—‡ ‖

A Modern Athenian.—The Achimenes is an American genus; A. longiflora and rosea are from Guatemala; grandiflora is from Mexico. They are Gesneraceous plants. All Gesneraceous plants are American. Therefore, your plant from the Himalayas is not likely to be an Achimenes.—†

L. S.—We wish we could help you to understand the cause of Hydrangeas turning blue. The subject is under investigation by Mr. Edward Solly, and as soon as any result is obtained we shall make it known.—†

A. S.—Your observations on the Exhibitions at the Garden of the Horticultural Society are sent to the Exhibition Committee, and will no doubt be taken into consideration. The suggestions are not new.—†

J. C. L.—Your plant is Myanthus barbatus, probably.—†

Cadwallader.—The quantity of woollen rags to be applied per acre upon light land varies from 3 to 4 cwt.; upon stiff land as much as 12 cwt. per acre will be required. They should be cut into bits about the size of a crown-piece, and in that state form an excellent manure.—‡

A Young Gardener.—We cannot insert the price of books except as an advertisement. You may learn the price of any work by applying to a respectable bookseller.—‡

W. M., Necton, would be obliged by any of our correspondents informing him of the best mode of preserving Parsneps, Carrots, Beet, &c., until late into spring.—‡

F. H., Ryde, Isle of Wight.—In your climate, where there is seldom any frost before Christmas, and where plants of all sorts are more liable to suffer from damp and cold, Orange-trees would not be injured if left exposed until the latter part of November. When housed for the winter they require just sufficient warmth to protect them from frost. Your alba odorata Rose, which you state to be a healthy, vigorous plant, covered every year with a profusion of buds, and looking very healthy until the period at which they should expand, when the damp has no doubt penetrated into a wet and cold subsoil, which causes it to put forth vigorous shoots of too watery a nature to expand the blossom-buds which they may develop, you had better take up and replant higher. It might be budded with the Maria Leonida, but we would recommend a wild stock in preference. The plant which you raised from seed brought from India, and which was there called the Moon-creeper, having the appearance of an Ipomœa, and producing a large white flower from 5 to 6 inches across, very sweet, and expanding in the evening, is the Calonyction Bona Nox, and is an annual.—†

Flora.—Your plants are—1, Colútea cruenta; 2, Colútea arborescens; 3, Scutellária galericulata; 4, Mentha pulégium; 5, Mentha hirsuta; 6, Saxifraga aizoides; 7, Solanum nigrum; 8, Heliánthemum canum; 10, Bromus mollis; 11, Calluna vulgaris; 12 and 13, Cistópteris frágilis.—‡

Discipulus.—Your Greengage-trees being planted in a strong clayey soil, it is more than probable that the ground above the roots has cracked, and the drought has thus penetrated to them. Your only plan is, during the autumn to remove as much soil as you can from about them, without injuring the roots, and to replace it with compost of a lighter texture: the quantity of manure mixed with it should, however, be small. The best method which you can pursue with your Apple-trees which are twenty years old, and are planted too deep, is to take away the soil from the surface to the depth of a few inches; but deep drains must be formed round them to carry off the superfluous moisture, otherwise this remedy will be of no avail. When trees get to that age, it is a difficult task to raise them, and unless your land is so situated that you cannot adopt the above method, we would not advise you to attempt it. You will find that an Apple-room situated over a warm kitchen will cause the fruit to wither and ripen prematurely, as well as destroy its juiciness. The best time to determine the name of an Apple is when the fruit is perfectly ripe.—‡

W. C. E.—Li'lium lancifólium is quite a distinct species from L. speciosum, and we are not aware that it has yet been introduced into this country. The garden varieties cultivated under that name are chiefly referable to L. speciosum.—‡

Escher.—The Magnólia is M. tripétala.—†

C. D. M.—Some of your seedling Fuchsias are very pretty, particularly those which have the habit of F. globosa. No. 55 is rather a large flower, but it wants the deep purple tinge so conspicuous in the petals of No. 67, which approaches nearly to F. Riccartónia in its general character. This desirable property is also possessed by Nos. 38 and 73. No. 68 is a singular flower; but it is too small, and not possessed of sufficient brilliancy to be valuable. Although many of them are good varieties for garden cultivation, still they are hardly distinct enough from other well-known kinds. No. 67 is the best.—‡

Experimental.—There is no doubt but your plan for preserving Pelargoniums and other Greenhouse Pants through the winter, in a garden too small to build a pit in, and not worthy of a greenhouse, would succeed; namely, by fixing against a wall a strong wooden frame, having a glass front and fitted up within with a tier of shelves; the whole to be protected by mats during severe weather. The aspect being south-east, you had better not uncover the frame while the sun shines directly upon the plants; otherwise, they will be excited into premature growth, and probably perish during the next severe weather which may occur. The foundation should be perfectly dry and raised above the level of the surrounding surface. The plants should receive no more water than is necessary to preserve them alive, and as much air should be admitted during fine weather as can possibly be given; this will serve both to keep them bushy and to dry the interior of the frame. The distance at which the plants are placed from the glass may be six inches; if further, they will most likely become drawn; they should also be turned round occasionally in order that they may not become one-sided.—‡

Anne.—Nos 2 and 11 are Fúchsia globosa; 3, 4, 5, 6, 7, 8, 9, 10, and 12, are all F. Thompsoniana, or mere var. of it. No. 1 appears to be F. díscolor, but the specimen had suffered by the way. "Anne" should add to her collection F. Riccartónia, which will make a beautiful object in a garden in the Isle of Wight.—§

W. B. M.—For an account of the best mode of converting the CLEANINGS OF A WEEDY POND into good manure, we refer you to Professor Sprengel's treatise on Organic Mineral Manures, at p. 524 of this year's *Chronicle.*—‡

Subscriber.—It is hardly advisable in building a hothouse to enclose a Peach-tree and a Nectarine; or, in other words, to build in front of them, Grapes being the chief desideratum; because the leaves of the Vine must overshadow the Peach-trees, and prevent their fruiting. By keeping the Vines to the rafters, and very good management, Peaches *may* be obtained in such situations if they are not too far from the light; but great practical skill, for which no directions can compensate, is required. We cannot tell what will be the cheapest plan of heating a hothouse 30 feet long, because you do not say anything of its breadth and height, or of the temperature you want to maintain. Where stone is cheap, it is probable that the open trough system is the cheapest.—†

T. S. P.—The reason why BLUE VITRIOL cannot be used for fixing ammonia is, that it is a salt of copper, and copper is regarded as injurious to vegetation; green vitriol, on the other hand is a salt of iron, and iron is harmless. BLEACHING POWDER is the chloride of lime of chemists, and is a most valuable disinfecting agent, and should always be employed where offensive smells have to be removed; the powder is cheap. It is not fair to get all our secrets out of us; however, you are right. For PRUNING ROSES we refer you to an article that will appear in our columns very soon, if not to-day. It is of no use to keep ACACIA AFFINIS at the foot of a west wall at Windermere, except as a curiosity.—†

Jonathan Labyrinth is partly answered in a leading Article of to-day. SALT at the rate of 8 bushels an acre has been found very advantageous to Potatoes on any sandy soil, especially if used with SOOT at the rate of 30 bushels an acre. We should certainly anticipate great advantage from the use of sea-sand and putrid sea-wrack. It is generally believed that mealiness is a property found exclusively in certain kinds of Potatoes, and not in others; no cultivation will make the waxy Dutch Potato mealy. But mealy Potatoes may be made watery by being grown in places insufficiently exposed to light; or which is the same thing, so thick as to choke each other up. Your other questions are answered elsewhere. We apprehend a brick tank well built in good lime and sand will hold liquid manure without the necessity of a cement facing.—†

A. P.—Your plants are 1, Aspídium filixmas; 2, Scolopéndrium officinarum; 3, a species of Eurýbia; and 4, Verónica decussata.—‡

A Subscriber.—It is a well-known fact that whole branches of various species of RIBES will die off without any apparent cause, and hitherto it has not been satisfactorily accounted for. It would be worth while for those persons whose trees are thus diseased, to examine the interior of the branches, and see if they contain traces of the Currant Sphinx, or any other insect which in many places commit such havoc among the common Currant bushes.—‡

Cestus.—The Pea is the late Grey, or tall Capuchin, and is only fit for field culture.—¶

Francesca.—As you are an amateur in gardening, we certainly would not recommend you to purchase a stock of HEATHS before the spring. You have done right in raising the stage of your greenhouse nearer the glass. The best description of peat for growing them in, is that which is most fibrous and contains the greatest quantity of silver sand. The reason you have hitherto failed in their culture has probably been in your having watered them irregularly, and in having kept them too confined. They should have air at all times when there is no danger of frost entering the house, and should be watered only when they really want it, especially in dull weather. The best time for potting them is after they have done flowering. We cannot recommend one nurseryman in preference to another; but there are several good nurseries round London, where you may purchase any quantity you may wish.—‡

C. I. I.—The following FRUIT-TREES may be recommended:—On your wall with a south aspect it will be proper to plant a Violette Hâtive Nectarine, a Grosse Mignonne, and a Late Admirable Peach. 14 trees for your west aspect may consist of—Nectarines: 2 Elruge; 2 Violette Hâtive; 1 Pitmaston Orange: Peaches—2 Royal George; 2 Noblesse; 1 Malta; 2 Bellegarde; 1 Royal Charlotte; 1 Barrington. For the east aspect, against which you wish to plant Apricots, Cherries, and Figs, the following are good varieties:—Apricots—1 Large Early; 2 Moorpark; 1 Royal; 1 Turkey and 1 Roman. Cherries: 1 Mayduke; 1 Knight's Early Black; 1 Elton; 1 Florence. Figs: 2 Brown Turkey; 1 White Marseilles; 1 Brunswick. All the above may be planted towards the end of next month.—‖

T. S.—The Apple has much of the Nonesuch character, and is like the Cellini.—‖

C. K.—Your Peach is the Late Admirable.—‖

S. K. H.—Your MULBERRY-TREE, which drops its fruit in a wet season as well as in a dry one, must have undoubtedly extended its roots into a bad subsoil. As it is not very old, it will be advisable to remove it next month, and plant it in good soil, on a well-drained bottom, so as to be free from stagnant water; but, at the same time, the situation ought not to be too dry, nor should the land be stiff loam, or clay.—‖

J. R. W.'s request shall be attended to.

J. W. T.—Nos. 1 and 2 of your Pears are Gansell's Bergamot; 4, 5, Crassane; 6, Colmar; 7, Napoleon; 8 and 10, Marie Louise; 9, Glout Morceau; 11, Flemish Beauty; 12, something worthless; 13, Williams's Bon Chrétien; 14, as bad as No. 12; 15, Hessel; and 18, Alfriston Apple.—‖

G. F.—APPLES in many cases have been known to keep well in a cellar, and in other instances they have failed to do so. A steady temperature, darkness, and purity of air, which should be rather dry than moist, are essential conditions to the preservation of this fruit.—‖

A Young Lady.—The most suitable VINES FOR THE OPEN WALL are the Royal Muscadine, early White Malvasia or Grove-end Sweetwater, Black Prince, and Black Cluster. It is very often the case with LATE PEACHES, that when excessive rain penetrates to the roots of the trees, and there becomes stagnant, after a previously dry season, the stones of the fruit split, and the latter drops in consequence. You will find that this will not be the case if your borders have a sufficient supply of moisture throughout the summer, and no superabundance when the fruit is ripening off.—‖

A Subscriber's plants are Cássia lævigata and Cladanthus arábicus.—†

Eileanach.—If you wish to attach A SHOW CASE FOR PLANTS to your drawing-room window, you had better manage it by building, at once, on the outside, a small glass roof and front, like a common greenhouse, and making the joints between it and the window frame secure. Then the lower sash of the window will allow the heat of the sitting-room to enter it. You cannot, however, depend upon such a mode of heating for the exclusion of severe frost, and therefore, in very cold weather, you would be obliged to add mats or some such protection on the outside. If you construct such a case, you should have a door in it which would will open into the outer air, so as to be able to ventilate and clean it when occasion arises. Such contrivances are occasionally seen in London houses.—†

J. B.—Probably Lindley's Elements of Botany, which is quite a distinct work, will assist you in your studies. It is expressly intended for beginners. If you want practice in learning to use the Natural System, then Lindley's School Botany is the book for you.—‡

Readingensis.—We are clearly of opinion that you cannot well WARM a conservatory and billiard room by one Arnott or Chunk stove. The very principle on which those kinds of heating apparatus should be constructed, is to prevent the escape of heat into the flue that passes from them. If you were to fix an Arnott in the thickness of the wall that separates those two buildings, still you would find the heat given off by it insufficient for the purpose of the conservatory, unless it is a very little one.—†

H. K. M.'s larvæ, committing such ravages on the leaves of the Pear trees, are called SLUG-WORMS, and will produce a Saw-fly, whose history, we hope, will shortly be given in the *Gardeners' Chronicle.*—*R.*

F. V. O.—We are much obliged to you for the autumnal examples of the larvæ of the GOOSEBERRY SAW-FLY. Those which we obtained last year in September, produced the same species of Tenthredo as the summer broods, and we have every reason to believe that F. V. O.'s are the same.—*R.*

Reader.—The most certain method for extirpating the caterpillars of the CABBAGE BUTTERFLIES, is to hand-pick them by day; to destroy the larvæ of the Cabbage moths, which are equally injurious, we must search for them at night when they come out of the ground and other hiding-places to feed. The history of these insects will appear in the forthcoming part of the Journal of the Royal Agricultural Society.—*R.*

A Constant Subscriber.—To KILL LARGE MOTHS, put them, one at a time, into a tin box, with a quarter of a pound of stone ammonia at the bottom, covered over with a piece of linen or blotting-paper, to prevent the insect from being injured. Smaller moths may be killed, many at once, by confining each in a pill-box, of sufficient size not to bind the wings; but pin holes must be previously pricked in the lid or sides, to admit the effluvia when they are shut up in the large tin box. Another method is, to place the moth or butterfly with a small piece of German tinder lighted under a tumbler, or finger-glass, which will stupify it; when that is done, light two or three sulphur matches, and burn them beneath the glass, which will at once despatch the animal. The use of the tinder is to prevent the moth from fluttering into the flame of the matches.—*R.*

J. R. W.—The following SMALL TREES, or LARGE SHRUBS, are suitable for planting on steep banks, exposed to north-west winds; but Evergreens are preferable to deciduous plants for intercepting the view of unsightly buildings; and when once established, are better adapted for a dry situation. It must, however, be observed, that no plants will thrive in such a place, if the soil is poor and dry; therefore, you must improve it by adding some manure to it before planting. Any of the following may be selected, which may be kept at the required height by pruning:—

EVERGREENS.	DECIDUOUS.
Common Laurel.	Lilac, Common and Persian.
Portugal do.	Almond.
Evergreen Oak.	Hornbeam.
Arbutus, or Strawberry-tree.	Male Dogwood.
Dutch and Common Hollies.	Scarlet and other Thorns.
Tree Box.	Broad-leaved Euonymus.
Sweet Bay.	Perfumed Cherry.
Chinese and Common Junipers.	Laburnum.
Phillyreas, *broad-leaved varieties*	Chinese Crab.
Yew.	Mountain Ash.
Mugho Pine.	Ribes sanguíneum.
Upright Cypress.	Birch and Hazel.

DAHLIAS will keep remarkably well in pits, in the same manner as Potatoes; but as the stems are apt to become rotten, care must be taken to fix numbers securely on them. Leaden labels, with the number stamped upon them, should be used for that purpose; and they should be fastened on round the neck with wire.—¶

R. E.—Of the Vegetables which you have raised from seed received from Frankfort, the TURNIP-ROOTED CABBAGE is not much esteemed in this country, but valuable in Germany, where it stands through the winter; the other *is* Celeriac. You should have put in cuttings of Roses, Honeysuckles, &c., before this; you may, however, strike them now, with care, and a gentle bottom-heat.—‡

Constant Reader.—Your Pears are—1, Flemish Beauty; 2, Urbaniste; 3, Glout Morceau; 4, Seckle; 5, Winter Nelis; 6, Napoleon.—‖

W. Scott.—Your Pears are, No. 3, 5, 11, St. Germain; 6, Sucré Vert; 7, probably winter Bon Chrétien; 8, E'chassery; 9, White Doyenné; 10, 15, Passe Colmar.—‖

S. Y.—Of your Apples, No. 1 is the Blenheim Pippin; 2, Kirke's Lord Nelson; 3, Court of Wick; 4, Royal Russet; 5, Old Nonpareil. The Pears are, 6, Achan; 7, Brown Beurré; and 8, Crassane.—‖

Fredericus.—Your seedling Dahlia is not worth preserving: the eye is badly filled up, and the yellow, instead of being pure, has a dirty, blotched appearance.—‡

H. C. W. L.—Your Apples are, No. 1, Dutch Mignonne; 2, Golden Reinette; 3, Kentish Fill-basket; 4, Golden Pippin; 5, Lemon Pippin; 7, Court of Wick; 9, Hoary Morning. The Pears are, 10, Marie Louise; and 12, Louise Bonne (of Jersey).—‖

T. S.—Your Apples are, No. 2, Kentish Codlin; 3, Catshead; 4, Hollandbury; 5, Alexander; 6, Flower of Kent; 7, Hawthornden; 8, Court of Wick; 9, Newtown Pippin; 10, French Crab. No. 8 is a good table Apple; so also is No. 9, if the season and situation are sufficiently warm. The others are all useful in their respective periods of maturity, as kitchen Apples; the Hawthornden is, however, considered to be the best bearer.—‖

A Correspondent.—NUTS may be preserved for a considerable length of time in new flower-pots, and a slight sprinkling of salt will prevent them from becoming mouldy. When filled, the pots should be inverted on a layer of dry sand.—‖

J. E., Rotherham.—The general form of your crimson Dahlia (*the North Midland*) is very good, the petals are also of a good shape and substance. The imperfection in the flower consists in the centre being filled with upright petals which open irregularly.—*

S. Girling.—The Dahlia you propose to name *Lilac Defiance* is much improved. The colour is agreeable, the form circular but rather flat; it will make a good border variety, but its properties are not sufficiently good for showing.—*

J. R. Pearson.—The bright canary yellow of your PANSY, *Sir W. Scott*, is very beautiful; the eye is rich, and clearly defined. In the specimen sent there appears to be a tinge of blue in the upper petals, which, if permanent, will reduce the value of the flower. *Elizabeth* is a showy and distinct variety, with a creamy ground-colour, and a fine dark eye; the lower petals are surrounded by a margin of bright blue, the top petals clouded. *Agnes* is a very brilliant flower; the colours are dark, and terminate with a clean edge—centre white—the eye bold, dark, and fine; a deep, rich border of purple surrounds the lower petals, and the upper have a tinge of mulberry. *De Buch* is a very finely-formed Pansy, with a white centre, a fine eye, and a broad margin of bluish purple round the lower petals: top petals purple. The same description would suit the *Chevalier* and *Comet*, varieties somewhat similar in colour and general appearance, but not of quite so high a character as the others. They are all finely-formed flowers, of good substance; the eye is bold and distinct in each, and the petals have an inclination to lie back and press upon each other.—*

A Subscriber.—We think it probable that your plant of PELARGO'NIUM ARDENS may be too old, and therefore recommend you to strike some cuttings from it. It grows very well in a mixture of turfy loam, peat, and sand; and ought to be kept in the Greenhouse, as near to the light as possible.—§

M. L.—We really cannot undertake the labour of NAMING whole boxes full of specimens. If we were to do so, our time would be entirely so occupied, to the exclusion of all other business. To name some kinds of plants, such as Asters and Salvias, for example, *correctly*, is very difficult and troublesome, and consumes a great deal of time.—†

N.—Your plant is Bomarea hirtella.—†

Tyro.—Yes.

Ignoramus.—ORCHIDACEOUS and ORCHIDEOUS are two words meaning the same thing. They are derived from Orchis, the name of some of our wild flowers, to which they have great resemblance.—†

T. Sedgwick.—Accepted for next week.—†

A Constant Reader must have patience. We shall keep our promise, but the matter does not press.—†

F.—The ANEMONE and the RANUNCULUS are not natives of the Cape of Good Hope, but have been introduced there by the Dutch. They require the same treatment as those which you receive from the nurseries.—†

MR. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3*d.* each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5*s.* for every 25 copies.

As usual, many letters have arrived too late for answers this week.

ERRATA.—Mr. Fuller's Pelargonium, Madlle. Rachel, ought to have been priced at two guineas, and not five.—In Mr. J. T. Willmer's advertisement of Sept. 24, Cooper's Prince Albert should be 5*s.*, and not 5*l.*

NEWS OF THE WEEK.

OUR Foreign news presents few subjects of political interest. In France the journals have been occupied with discussions on the American tariff, and the Government has been engaged in a contest with the provincial councils, on some matters of local administration. The details of these proceedings are entirely of domestic interest, but they are somewhat varied by the continued efforts of the clergy to regain the influence they enjoyed under the elder Bourbons. These pretensions are encouraged by the Government and the Queen, but are so warmly opposed by the municipal councils and the press that there seems little chance of the restoration of the clergy to their former power.—The Spanish papers are also occupied with matters of a domestic character; the mission of M. Salvandy to Holland and the proceedings of Gen. Zurbano in Barcelona are the chief topics of discussion, but they present nothing to call for observation.—Advices from Portugal inform us that the Cortes have been adjourned till December in consequence of a Ministerial crisis attended by a partial change of the Cabinet. Three new Ministers have been appointed, and the change has given great satisfaction to moderate politicians who look more to the advantages of a strong Government than to the ascendancy of party.—From Germany we learn that the King of Hanover has recovered from his recent illness, and has made his appearance at the opera for the first time since the death of the Queen. A treaty is in progress between Hanover and Great Britain for a modification of the Stade duties; the details have not officially transpired, but the Ministerial papers state that his Majesty has agreed to a reduction of one fourth of his revenue derived from these duties, and that the result will be highly beneficial to British shipping.—From Constantinople we have further particulars of the late dismissal of the Grand Vizier, who has been invested with a new dignity by which his removal from the capital is ensured. It is now ascertained that he encouraged the recent revolution in Servia, and that fresh disturbances have been excited among the Maronites by his agency. The quarrel with Persia was also likely to be renewed under his administration, notwithstanding the mediation of the Great Powers. His removal is therefore considered a subject of congratulation, as there is little doubt that the success of his plans would have involved the whole Empire in war. The Sultan has conferred the dignity of honorary Grand Vizier on the Pacha of Egypt, in consideration of his obedience and devotedness to the Imperial throne, and of his long and faithful services. Letters from Egypt mention that the Pacha is so much flattered by this mark of favour that he intends visiting Constantinople next year, notwithstanding his great age, for the purpose of making his personal submission to the Sultan.—The revolution in Servia still excites great attention; Prince Michael and his family have been declared to have forfeited all right to the sovereignty of the country, and Alexander Petrowitsch, a godson of the late Emperor of Russia, has been elected in his stead.—From the Cape of Good Hope, we have papers to 31st July: the insurgent Boers have thrown themselves on the mercy of the Government, and the troops have completely succeeded in re-establishing British authority at Port Natal.

At home, the Queen in Council has ordered the usual prorogation of Parliament for another month, and has directed a Form of Prayer and Thanksgiving for the late abundant harvest to be used to-morrow, at both services, in all churches and chapels throughout England and Wales. Our provincial news contains the reports of many of the autumnal fairs, at which the effects of the New Tariff have been very generally felt. The importation of foreign cattle into the great ports is daily increasing, and there seems little doubt of the continuance of the supply.

Home News.

Court.—*Her Majesty*, Prince Albert, the Prince of Wales, and the Princess Royal, continue at Windsor Castle. It was expected that the Court would leave the Castle for Claremont in the course of the week, but the visit has been postponed for the present. On Saturday, the Queen held a Privy Council, at which Parliament was ordered to be further prorogued until Thursday, Nov. 10; and a Form of Prayer and Thanksgiving for the late abundant harvest was agreed on. The Archduke Frederick of Austria, who arrived at the Castle last week on a visit to Her Majesty, took his departure on Wednesday, accompanied by Prince George of Cambridge, the Grand Duke of Mecklenburgh Strelitz, Prince Esterhazy, Prince Castelcicala the Neapolitan Minister, Sir Robert Stopford, and several other distinguished personages, who had been invited to meet his Imperial Highness. Her Majesty the Queen Dowager will leave Bushey Park next week for Canford House, Dorset, the seat of Lord De Mauley, for the winter. Her Royal Highness the Duchess of Gloucester arrived at Chatsworth, on Saturday, from Ravensworth Castle, on a visit to the Duke of Devonshire. His Royal Highness the Duke of Cambridge left Ravensworth last week for Alnwick Castle, on a visit to the Duke of Northumberland, and has since arrived at Wynyard-park, on a visit to the Marquess of Londonderry. Lord Rivers has succeeded the Earl of Hardwicke as Lord in Waiting on the Queen; Captain Duncombe has succeeded Mr. Ormsby Gore as Groom in Waiting on her Majesty; the Hon. Matilda Paget has been succeeded by the Hon. Miss Hamilton, as Maid of Honour.

Diplomatic Appointments.—The Queen has been pleased to appoint the Right Hon. Henry Ellis, formerly Ambassador at the Court of Persia, to proceed on an extraordinary and special mission to the Court of Brazil.—The Queen has appointed the Earl of Wilton to proceed as Envoy Extraordinary to the Court of the King of Saxony, for the purpose of investing his Majesty with the ensign of the Order of the Garter.

Church Preferment.—The Rev. Dr. Turton, Dean of Peterborough, and Regius Professor of Divinity in the University of Cambridge, is to be appointed Dean of Westminster. The Deanery of Peterborough, expected to become vacant by this appointment, will be conferred, it is said, on the Rev. Dr. Graham, Master of Christ's College, Cambridge, and Chaplain to Prince Albert. The newly-created Archdeaconry of Lindisfarne has been conferred on the Rev. E. T. Brigge, Fellow of Merton College.

Parliamentary Movements.—As announced above, Parliament is further prorogued from Thursday next the 6th inst. to Thursday the 10th November.—Mr. Robartes has commenced a canvass of the electors of Bodmin in behalf of the eldest son of Sir Joseph Sawle, on the Liberal interest; and Sir Samuel Spry, the former representative, has also offered himself as a candidate.

The Thanksgiving Prayer.—The following is the prayer of thanksgiving for the late abundant harvest, ordered by the Queen in Council to be used to-morrow at morning and evening service in all churches and chapels in England and Wales:—"O God, through whose good Providence the earth yieldeth food for the sustenance of man, we offer unto Thee our hearty thanksgivings for Thy late mercy vouchsafed to us, in blessing the labours of our husbandmen with plentiful increase, and preserving the fruits of the field for our use. Give us grace, we humbly beseech Thee, that, whilst we receive Thy bounty with thankfulness, we may regard the blessing bestowed on us as a call to repentance, and turn from the evil of our ways. Remove from amongst us all causes of strife and contention; put an end to our unhappy divisions; and grant that all conditions of men, impressed with the fear of Thy judgments, and trusting in Thy fatherly care, may faithfully serve Thee, in loyalty to their Soverign, in obedience to the laws, in kindly affection one to another, and in dutiful resignation to Thy will; that so, under the guidance of Thy Holy Spirit, we may pass through this world in peace and contentment, and finally, by Thy mercy, attain everlasting life, through Jesus Christ our Lord. Amen."

Foreign.

France.—There is little political interest in the journals of this week; the difference between the Home Minister and the Councils of the Departments has been settled by a judicious concession on the part of the Government. The Council of the Marne, in the vicinity of Paris, having refused to vote the Prefect's expenses, unless he furnished full accounts, the Minister sent an order allowing him to do so. M. Duchatel had in the first instance resisted; but M. Villemain, as Home Minister for the time being, took upon him to consent, and has saved the Cabinet much embarrassment by the compromise.—The Departments are warmly engaged in a contest with the clergy, who have re-commenced the task of recovering the influence and wealth enjoyed under the elder Bourbons. The Government and the Queen are in their favour, but the municipal and departmental councils, and the press, actively oppose their pretensions.—The French Ministerial journals have been discussing the American Tariff with some warmth. One declares that, owing to the exertions of the Ambassador, it has been rendered much more favourable to the French than to the English. The other Ministerial paper takes a gloomier view; it states that American ships, already laden in France with 12,000 tons of French goods, have unladen them, in consequence of learning the Tariff, and sailed without any cargo. As to England, says this paper, it can defy any high American Tariff, from its facilities of smuggling, but the French can only look to reprisals. The Opposition papers, on the other hand, contend that it is highly prejudicial to French interests, and attack the Government for not obtaining better terms.

The Capital.—It is said that there have not been for many years so few English resident in Paris as during the present season. The hotel-keepers and shop-keepers complain of the absence of their best customers. The improved facilities for travelling on the Continent cause tourists to explore Germany and the Rhine in preference to France, and the "war fever" caused by M. Thiers has not yet subsided sufficiently to induce the English to make Paris their abode as formerly.—The notorious Deutz, whose name has been so odiously mixed up with the arrest of the Duchess of Berry in November 1832, has been arrested in Paris, and was on the point of being tried under a charge of mendicity and vagrancy. The unfortunate man, after squandering 500,000 francs, paid him for betraying the Princess, had fallen into the most abject misery. It will be remembered that he abjured Judaism, and was admitted into the Catholic church, under the auspices of the Duchess of Berry, who had even condescended to act as his godmother on his baptism. In 1833 Deutz returned to his original creed, and whilst his father lived he received from him ample means of existence. After the death of his parent he was obliged to have recourse to the charity of his co-religionists; but this resource at last failing him, he was reduced to beggary, arrested in the street, and lodged in a charitable asylum. The papers comment on the lesson afforded by the destiny of this man, of whom the Duchess de Berri said, on the day after her arrest, "I have been betrayed by a man whom I loaded with benefits, who owes to me more than life, and in whom I placed entire confidence; but I have at least the satisfaction of knowing that he is not a Frenchman." He is a native of Italy.—The operation of tubing the Artesian well at Grenelle has recently been completed in the most satisfactory manner. In order to understand the importance of this work, it is necessary to refer to the causes which have rendered it necessary. In the month of February 1841, after eight years' persevering labour, the spring at Grenelle began to pour forth a volume of water of not less than 2600 litres a minute. But, although the source was as pure as that of the Seine, it had as dark a colour as the waters in the gutters of the streets. A pipe of joints, 1800 feet in length, copper turned, made as a telescope, was placed in the excavation; but not being strong enough to resist the force of the ascending waters, it was soon flattened and destroyed. M. Mulot, thereupon, had a new tube of beaten iron, each joint of which was thick enough to resist a pressure equal to 70 atmospheres. On the 20th ult., after only four days' labour, the tube was properly fixed, and the water now flows abundantly, clear as rock crystal, and at a milk-warm heat. The old workshop, from the middle of which the current flowed, is already half destroyed, and on its site a scaffolding of strong boards, 100 feet high, is erecting, which will direct and form a channel for the waters rising to this height. Paris will now possess an inexhaustible supply of excellent water, rushing from such an elevation as to be easily distributed to the loftiest situations in the city.

The Provinces.—The adjudication of the contracts for the third and last portion of the railroad between Paris and the Belgian frontier, within the Seine et Oise, from the Sanceron to the limits of the department, will be decided on the 21st of this month at Versailles. Thus the first section of this northern road, extending from Paris to Creil, a distance of 641 miles, will be entirely contracted for.—The Minister of Public Works, accompanied by the directors, secretary, and engineers, recently made an inspection of the works on the Paris and Rouen line as far as Vernon, and particularly the two bridges over the Seine at Bezons and Maisons, the Poissy Viaduct, and the Vaucouleurs Bridge. The minister also examined the works in the tunnel at Rolleboise, and went as far as the skew bridge at Vernon. He several times expressed his satisfaction with the zeal and ability displayed in the execution of the works.—The *Railway Moniteur* announces that immense workshops for a foundry and engineering establishment are being built by the Government at Recouvrance, near Brest; that the French Government has ordered galvanised iron to be used on all the important parts of the steamers now being built; and that some English capitalists have it in contemplation to form a line from Bordeaux to Vigo, Bilboa, and Santander, and so form a communication with Falmouth, Southampton, and London.

Spain.—The Madrid Papers are principally occupied with the late duel at Cadiz, noticed in our last Number; but no facts are stated with which our readers are not already acquainted. In reference to the mission of Señor Olozaga, the ministerial papers state that he has been ordered not to mention the affair of M. Salvandy which occurred last year; not to touch upon the matrimonial question; and not to solicit the recognition of the Queen from any power. From Barcelona we learn that Gen. Zurbano having been reported to have maltreated a French inhabitant of Gerona, the French Consul at Barcelona has addressed warm remonstrances to the Captain-General.

Portugal.—We have advices from Lisbon to the 19th ult. The Cortes had been adjourned on the 15th, by royal decree, till the 1st December, when they will meet again to pass the Douro Wine Company Bill, and other Government measures now in various stages in one Chamber or the other. The cause of the adjournment appears to have been a Ministerial crisis, attended by a partial change of the Cabinet. The Ministers of Marine and Justice have retired; and the Foreign Office, hitherto held provisionally by the Duke of Terceira, has been conferred on Senhor Gomez de Castro, one of Don Pedro's confidential friends, and an able diplomatist. The other new Ministers are S. Souza e Azevedo and S. Falcao. These three appointments have given great satisfaction to the practical men in the Chamber.

Hanover.—The King has recovered from his recent illness, and was present on the 19th ult. at the opera in Hanover for the first time since the death of the Queen. He was very cordially received.—A treaty is said to be on the eve of conclusion between Hanover and Great Britain, for the regulation of the Stade toll. The particulars have not transpired; but the Ministerial papers state, that the King of Hanover has agreed to the reduction of at least one-fourth of his toll revenue, that the duty is henceforth to be imposed on the cargoes exclusively and will therefore fall upon the consumers, and that the shipping interests of England will be freed from all fees, charges, and impediments whatever.

Germany.—The German papers comment with some severity on the record deposited beneath the foundation-stone of the new buildings of the Cathedral, which sets forth, among other things, that the Kings of Hanover and Wurtemberg were present at the solemnity. The intelligence that these two sovereigns were unable to attend the ceremony arrived too late to afford time for the erasure of their names from the record. Thus, the inscription on the stone, stating that they were present, must be regarded as a deviation from the truth, both in an historical and religious point of view, and it now appears likely that another record will be deposited to correct the misstatement. The inscription is, moreover, incorrect in another point. It is dated, "Tertio idus Septembris." As this should correspond with the 10th of September, doubts may naturally arise in future generations respecting the day on which the foundation-stone was actually laid. The papers contend, that it is strange that the record of a festival, in a great measure consecrated to German unity, should be written in the Latin language, and observe, with truth, that if their own noble mother-tongue had been made use of, the stone would at least have recorded the date of the 4th of September.—The continued destruction of German towns by fire is becoming every week more serious. The town of Rheinbach, which forms part of the Cologne district, was a few days ago the scene of a great calamity of this kind. A fire broke out in the morning, and, owing to a deficiency of water, it soon raged with such fury, that before the evening half the town was in ashes. Fortunately a heavy shower of rain fell about 4 p.m., and arrested the progress of the flames. More than 100 families are without a home.

Holland.—We learn by the Dutch papers of the 25th ult., that the banns of marriage of the Hereditary Grand Duke of Saxe Weimar, and the Princess Sophia of the Netherlands, were published on that day for the first time. It is expected that a programme of the festivities on this joyful occasion will shortly be published.

Switzerland.—Some disturbance having occurred in Geneva on the 8th ult., petitions were addressed to the Council of State, demanding the execution of the laws relative to foreigners, and the expulsion from the canton of a Frenchman, M. Lecomte, editor of the *Journal de Genève*. A letter from that city of the 14th, quoted by the Lyons papers, states that the Council of State had ordered M. Lecomte to quit the canton. It was feared, however, that a new disturbance would take place on this occasion, as the friends of M. Lecomte were determined to resist his expulsion. On the 13th the Artillery were ordered out, in consequence of a report that he had not left the canton; and the office was searched by the authorities, but without success. It is expected that he is still concealed in Geneva.

Norway.—The Hamburgh papers of the 16th ult. state, that the motion relative to the permission for Jews to reside in Norway has been rejected by the Storthing. It appears that 51 members voted for it, and only 41 against it; but as it is a question involving a change in the Constitution which requires two-thirds of the votes, it was of course lost.

Greece.—Letters from Athens state, that the vexatious proceedings of King Otho in opposing fresh impediments to foreign commerce have led to renewed remonstrances on the part of the British Minister, and that the Greeks are loud in their protests against the expenditure of the Court. Some idea may be formed of this from the fact that the King is now sending persons to Paris to select 600,000 francs' worth of furniture for his new palace, which has already cost the country several millions of drachmas. As the treasury is known to be empty, and the expenditure to have exceeded the revenue, the source from which the money for the furniture is to come from can only be accounted for by recollecting that the King succeeded in getting the management and control of the New National Bank into his own hands. Money for present purposes is easily raised by manufacturing and issuing its paper notes, without regard to the terms of its charter; and it is said that several hundred thousand drachmas' worth of notes are in circulation, without there being any cash in the bank coffers to meet them if presented.

Italy.—A letter from Rome informs us that the Pope, who is so distinguished a collector of Etruscan antiquities, is about to pay another visit to Civita Vecchia, and the remains of the ancient cities of Etruria in its neighbourhood, but had expressed his desire that no extraordinary preparations should be made for his reception. The Grand Duke of Tuscany and other high personages are also expected at Civita Vecchia.—By a recent ordonnance of the Neapolitan Government, the duty on printed books imported into the Two Sicilies is reduced one-half—an important concession to all travellers and residents in that kingdom. The duty in future will be equal to 6½*d.* per volume for octavos or books of a smaller size, 1*s.* 1½*d.* for quartos, and 1*s.* 7½*d.* for folios. This reduction has, in fact, been virtually in existence by way of favour for some time past, but it had not been formally proclaimed. Under its operation the importation of books into the Neapolitan dominions has greatly increased. In 1839, only 26,609 volumes, of which 7,183 were from France, passed through the Custom-houses. In the following year, the number, owing to the facility alluded to, was 60,916, of which 35,480 were from France.

RUSSIA.—Letters from St. Petersburg mention that the Emperor has set out on an extensive tour in the interior of the empire. He proceeds first to Kiew, thence to Wossnossonk to review the troops assembled there, thence to the ports of the Black Sea, particularly Odessa and Sebastopol, whence he will return by way of Warsaw and St. Petersburg. It is said that he returns by Warsaw, in order to superintend a re-construction of the Polish Army, and even a restoration of the use of the Polish tongue in schools.—Further particulars have been received of the loss of the Russian line-of-battle ship, the Ingermanland, on the 12th ult., about two miles from Christiansand. It appears that a severe gale was blowing from the east, with a heavy sea. About half-past ten on Sunday evening (the 11th) uninterrupted firing of heavy cannon was heard at Christiansand, which continued till 2 A.M. Twice during the night the Government steam-packet and several pilot-boats were sent out to discover the cause; but it appears the ship had got off the rock and driven rapidly to the westward, so that they did not see her. On Tuesday morning accounts were received that a line-of-battle ship was drifting westward of the Naze, and the Government steam-packet was again sent out; and having come up with her about thirty-six English miles west of the Naze, she succeeded in saving 150 of the crew. By crafts from Mandahl and Faursund, and an Irish vessel, the Gipsy, of Belfast, 300 men and several of the officers had been previously saved. The captain of the ship had been among the first to leave the vessel, although his wife was on board; she would probably have perished if she had not been taken off the wreck by one of the Mandahl boats. The ship's guns were all thrown overboard; and the last accounts state that she has become a total wreck. It is supposed that the crew amounted to 936 men, of whom about 500 are saved.—Letters from Moscow of the 14th inst. bring the melancholy information that the wealthy town of Casan has almost entirely fallen a prey to the flames. The fire had raged for four days when the mail left, and was not then extinguished. About 2,000 houses were burnt, all the warehouses, twelve churches, the university, and all the public buildings. The greatest part of the loss will fall on the Second St. Petersburg Insurance Company, and the shares, which stood before at 410 to 415 roubles, are now sold at 280 roubles. It is fortunate that the fair had not commenced, or the calamity would have been much greater, Casan being the chief market-town of Eastern Russia. These letters also state that several thousands of Israelites of Poland and Russia have entered into an engagement to proceed, on the first favourable opportunity, to Jerusalem, there to await in prayer and fasting the coming of the Messiah.

TURKEY AND SYRIA.—By the arrival of the Levant mail we have accounts from Constantinople to the 7th ult. By an imperial firman of the 4th, Izzet Mehemet Pacha, the late Grand Vizier, was appointed Governor of Adrianople and of the provinces of Tchirmen, in the place of Said Pacha; he repaired on the same day to the Porte, and there received the investiture of the new dignity conferred upon him by the Sultan. The papers refer with satisfaction to his removal from the office of Prime Minister, as it is no longer doubtful that his dangerous activity produced the revolution in Servia, and that another disturbance has been excited among the Maronites by his agency. Besides these acts, he had collected troops on the frontier, in order to foment the quarrel with Persia, and had negotiated with the Pacha of Egypt for the invasion of Persia by an Egyptian army under the command of Ibrahim. It is supposed to be in connexion with this intrigue that the Sultan had been advised to give Mehemet Ali "another proof of his imperial satisfaction by raising him to the dignity of Grand Vizier, in consideration of the sentiments of obedience and devotedness to the imperial throne with which the Governor of Egypt was animated, and of his long and faithful services." The imperial rescript, together with a decoration, similar to that worn by the Grand Vizier, was delivered, in the presence of the Sultan, to Sami Pacha, who was to sail in a few days for Alexandria.—Accounts from Beyrout represent the Maronites as being in a state of civil war, and as having come to hostilities in Ghazir. Mustapha Pacha has sent 1,000 Albanians to keep peace, and they had begun by entrenching themselves in one of the strongholds of the mountains at Djuni.—The building of the Protestant church at Jerusalem was going on slowly; Bishop Alexander was not yet entirely recovered from his recent illness.—The revolution in Servia and the state of the Provinces on the Danube continue to excite great attention. It seems that Prince Michael refused the terms offered him by the successful insurrectionists. The four European consuls remonstrated in his favour; whether the Russian consul did so sincerely is much doubted. The affair is now said to be a plot of Izzet Pacha, the Grand Vizier, whose dismissal we noticed in our last. Prince Michael, with his uncle Ephraim and his mother, Princess Linbicza, remain in the quarantine at Semlin. Wutschitsh, the leader of the insurrection, who was in Belgrade, quitted it under pretence of going to Panezewa, but suddenly appeared in Semiendua, and thence hastened to seize the park of artillery at Kragujewatz. Prince Michael and his mother hastened together to engage the foe, but their troops fled after a few shots. A provisional Government has been formed of five members, by which Prince Michael has been deposed, and Alexander Petrowitsch, a son of Czerny George, elected in his stead. Deputies from the seven districts have been summoned to Belgrade to give counsel, until the Porte shall have decided what to do under the circumstances.

EGYPT.—Our intelligence from Alexandria is of the 6th ult. The crews of the fleet having been paid one year's arrears, they were all towed out of the harbour on the 2d. The fleet was cruising in sight, communicating with the land by means of two steamers. On the 9th, immediately after the departure of his daughters for Cairo, Mehemet Ali, whose extraordinary energy is still unimpaired notwithstanding his great age, intended to repair on board the Admiral's ship, and to remain at sea during five or six days. He is said to be greatly flattered by the mark of distinction conferred on him by his Sovereign, and declared that if he were invited to repair to Constantinople, he would not hesitate an instant to go and throw himself at the feet of the Sultan; and that if he received no such invitation, he would solicit leave to proceed to that capital in the course of next year. According to letters from Cairo of the 4th inst., mortality among the cattle in the chiftliks of the Pacha had been of late very considerable. No less than 13,000 oxen had died there, and 2,700 on the lands of Ibrahim Pacha. Not a single beast had survived on those of Sami Pacha.

UNITED STATES.—By the arrival of the Warspite with Lord Ashurton, American papers of three days' later date than those brought by the last packet have been received. Their contents relate chiefly to the dinner given to his Lordship at New York. The recent treaty seems to have created a general feeling of approbation throughout the United States, and Lord Ashburton has been everywhere received in the most enthusiastic manner. His reception at New York was flattering in the extreme. At the Civic Hall between 2,000 and 3,000 citizens were introduced to him, and at Astor House he was entertained at a public banquet, which is described as one of the most important and interesting festivals ever given in that country. Mr. Jay, son of the well-known statesman of that name, presided. After the health of the President and the Queen had been drunk, Mr. Jay gave "Our guest, Lord Ashburton; happiness and honour to him who has contributed to preserve peace between two great nations." The music then struck up "The fine old English gentleman." Lord Ashburton acknowledged the honour at some length. After adverting to the circumstances of his mission, he referred to the similar task imposed on Mr. Jay at a time when both countries were harassed by wild passions, and war was raging throughout the continent of Europe. "Fortunately, gentlemen," he said, "I have had much less difficulty to encounter; for when I add to the reception I met with at Washington from the President—from his Cabinet—from the Senate and House of Representatives—that cordial welcome which I received at Boston—that cradle of American liberty and independence—and also the reception with which I have been greeted here, as well as in your City-hall, where I have been told that I shook hands with upwards of three thousand persons, collected there by one common impulse—as to this festive board, around which I see such a large number of your most respectable citizens, I naturally ask, where is the danger of war between England and America? Whatever may be hiden I do not pretend to scan; but, of a verity, I can say that I have seen nothing but the greatest and most unaffected cordiality and good will and friendship. Still, although my mission has been made in peculiarly happy circumstances, yet I trust that I will not be chargeable with vanity in saying that 'I, too, have done the State some service.' (Lord Ashburton was here interrupted for some time by loud and long-continued cheering, in which the voice of Major Jack Downing was heard vociferating 'Bravo! bravo!') Looking on this country, and observing everywhere the same vigour of intellect, and the same generosity of feeling with which I had the honour to be acquainted many years ago, I cannot believe that such a people and my countrymen can ever be brought to make war upon each other." The speech of Lord John Hay, Captain of the Warspite, was much applauded for its straightforward sailor-like tone. He appealed to the American commodore and officers present to support his statement that speaking was not a sailor's profession. He begged to express his joy over the conclusion of the treaty, even if treaties are not supposed to be what men in arms are desiring. "As this good feeling," he said, "is going on and increasing, we may as well put back, and for ever, our swords into our scabbard, for we shall have no occasion to use them. I hope they may rust a long while there, if they are to be drawn against each other. I hope the peace may be lasting, at least as long as I last. I have no desire ever to be engaged in such an unnatural war as must be this between your and my country." The Americans who spoke responded cordially to these sentiments, alluding with pride to their Anglo-Saxon origin, and expressing a hope that the peace between two kindred nations allied in a manner hitherto unknown in the history of mankind may never again be broken.

INDIA.—In the present state of affairs in India, everything connected with the welfare of the prisoners is naturally interesting. We therefore quote the following extracts from a letter addressed by Lieut.-Col. Fane, Aide-de-Camp to the late Commander-in-Chief in India, to the editor of the *Times*, which has produced some discussion in political circles. Col. Fane, in reference to the delay of the troops in not advancing to the rescue of the prisoners in the hands of Akhbar Khan, and the other Affghan Sirdars, states, that on the first advance of the British army into Affghanistan, the most peremptory orders were issued by the late Commander-in-Chief, forbidding ladies, or women of any description, to join the troops in active service in the field. "As long," he continues, "as the Commander-in-Chief, Sir Henry Fane, was with the army, this order was probably obeyed; but long before he quitted India, ladies, and multitudes of women, hastened to Cabool and other places then in our possession, released from all military obligations by civil authority. They are all prisoners, and it will be seen that these very unfortunates will be the means of further disgrace and dishonour to the British arms. It will be the women that would alone prevent any advance on our part, even supposing that our troops were perfectly equipped for a forward movement on Cabool. Akhbar Khan, at the first intimation of a move on his capital, will send in such a message as this:—'Move at your peril; I have hitherto treated your ladies and prisoners kindly, but the first move towards Cabool I shall consider myself released from all obligations towards them and you.'" In reference to the charge of cruelty, in not advancing to their relief, Col. Fane says, that if the writers of such charges would inquire "what treatment Christian ladies and women might undergo in the hands of furious and bigotted Mahometans, they would learn that which might in common charity deter them from urging measures which would only lead to outrages upon our unhappy countrywomen, a hundred times worse than death itself."

CAPE OF GOOD HOPE.—Cape papers to July 31 have been received in the City. They mention the arrival of a vessel in Table Bay, on the 29th, from Port Natal, whence she had sailed on the 15th of the month. Her advices state, that peace and submission are the order of the day. Colonel Cloete was in Pietemauritzberg. Eighteen men and a serjeant of the 27th, who had been some time prisoners, had been sent back, and said they experienced very good treatment. The Boers had thrown themselves almost entirely on the mercy of the Government. In addition to these, there were other reports in circulation; but they were not of a nature to command much attention, being, for the most part, regarded in the light of mere conjectures. It was affirmed that the submission of the Boers was hastened by the readiness of the Zulus to finish the revolt by an attack upon them with a force of many thousand men; that Potgieter, their leader, had announced to Pretorius and the rebels that he would not assist them, nor promise to remain neutral if the British attacked him; that Colonel Cloete had issued another proclamation, at the expiration of ten days allowed to deserters to return to their duty, offering a general pardon, except to deserters and five Boors, namely, Pretorius, Prinsloo, Berger, and the two Bredas, father and son. Such were the rumours of the day, but the main point was deemed certain, that the troops had re-established British authority in Natal.

CITY.

Money Market, Friday.—Consols for money closed 92¾ to ⅞; ditto, account, 92⅝ to 93; India Stock, 247 to 249; Exchequer Bills, 2*d.* issue, 48*s.* to 50*s.* prem.; ditto, 2¼*d.* issue, 49*s.* to 51*s.* prem.; India Bonds, 36*s.* prem.; and Long Annuities, 12⅜ to 7.16.

Metropolis and its Vicinity.

Election of Lord Mayor.—The election of Lord Mayor took place on Thursday. The Common Hall was much crowded on the occasion, from a general impression that a contest would take place in consequence of the recent discussions respecting Alderman Thomas Wood's connection with the Talacre Iron Company. About 800 persons were present. After the usual address from the Recorder, the Lord Mayor, Aldermen, and Recorder left the Hall, and proceeded to the Court of Aldermen to await the decision of the Livery. The Common Sergeant then read over the list of the Aldermen's names as they were afterwards submitted to the livery, that of Alderman Thomas Wood being the first in rotation. The Common Sergeant also read a letter from the medical attendant of Alderman Lainson, the next in rotation, stating that that gentleman was in ill-health, and requesting that he might not be put in nomination. Alderman Thomas Wood then addressed the Livery in reference to the recent reports prejudicial to his character, and concluded an earnest appeal by entreating that he should not be judged before he had been heard; and that aspersions on his character should not be believed until an opportunity of answering them had been given. The show of hands was then taken, and declared by the Sheriffs to be in favour of Alderman Thomas Wood and Alderman Humphrey, the two next in rotation to the mayoralty. The Common Serjeant and Sheriffs forthwith proceeded to the Court of Aldermen with the names of these gentlemen; and after a discussion of about an hour, the Lord Mayor and Aldermen returned to the Hall, when the Recorder announced that they had elected Alderman Humphrey, by a large majority. The Lord Mayor elect then addressed the meeting, and stated, that if he had refused to serve, he should not have promoted the return of Alderman T. Wood, for the Court were so determined not to elect that gentleman, that they would immediately have chosen a junior Alderman. He was then invested with the insignia of his office; and a vote of thanks was passed to Sir John Pirie for the distinguished manner in which he has upheld the dignity of his office during his Mayoralty, and for the munificent liberality he has shown to all the City charities.

The New Sheriffs.—On Wednesday the Lord Mayor and Aldermen, the Sheriffs and other City Officers, attended at Guildhall, for the purpose of swearing in the new Sheriffs, when Mr. Alderman Hooper and Mr. Jeremiah Pilcher took the oaths as Sheriffs for the ensuing year.

Death of the Marquis Wellesley.—We regret to record the death of this distinguished statesman, who expired at Kingston House, Knightsbridge, on Monday morning, after an illness not by any means lengthened, and which at first caused but ordinary anxiety to the family connexions. It was known for some days previously that the Marquis was indisposed, and although only suffering from debility consequent on his attack, the medical attendants considered that, at his great age, it was impossible to foresee the result. His Lordship was born on the 20th June, 1760, and was, consequently, in his 83d year. He was the eldest son of the first Earl of Mornington, of whose family the present survivors are his Lordship's brothers Lord Maryborough, now Earl of Mornington, the Duke of Wellington, the Hon. and Rev. Gerald Valerian Wellesley, Lord Cowley, and a sister, Lady Anne Culling Smith. After studying at Eton, his Lordship entered Christ Church, Oxford, where he particularly distinguished himself for those classical acquirements which have thrown such lustre on the latter years of his life. He represented Saltash and Windsor in the Parliaments of 1784 and 1790. In 1797 he was appointed Governor-General of India, when he was created a Baron of the United Kingdom. He remained in India until 1805, when he returned to this country loaded with honours, his administration being the most brilliant and vigorous on record, distinguished more particularly by his successful operations in the Mysore, the defeat of Tippoo Saib, and the capture of Seringapatam. During his absence in India his Lordship was advanced to an Irish Marquisate, by the title of Marquis Wellesley. In 1809 he went to Madrid as Ambassador, and in the December of the same year accepted the office of Secretary for Foreign Affairs, on the retirement of Earl Bathurst, which post he filled during the Administrations of the Duke of Portland and Mr. Spencer Percival, until 1812, when he was succeeded by the Marquis of Londonderry. In 1821, he succeeded Earl Talbot as Lord-Lieutenant of Ireland, and continued to hold that appointment until 1828, when the Marquis of Anglesey was named his successor. He again went to Ireland as Viceroy in September 1833, when the Marquis of Anglesey retired, but remained there little more than a year—as, on the breaking up of Earl Grey's Ministry in December 1834, he of course resigned office with his colleagues. Previously to this he was Lord Steward of the King's Household. In addition to his classical attainments, his Lordship was the author of several publications on temporary political questions, particularly on those connected with India; and a volume of his despatches, which bears evidence of his cultivated mind, has recently been published. By his Lordship's demise, a Garter becomes vacant, the Marquis being, with the exception of the Duke of Rutland and the Earl of Lonsdale, the senior Knight of the Order. A pension of 2,693*l*., which his Lordship enjoyed as Chief Remembrancer of the Exchequer in Ireland, now reverts to the Crown, and the Marquisate and Barony of Wellesley become extinct. Lord Maryborough succeeds to his father's Peerage, and becomes the Earl of Mornington; and his son, the Hon. T. Long Pole Wellesley, becomes Viscount Wellesley.

The Registration.—The reserved question respecting the assessors of the Income-tax which we noticed last week was decided by the *revising* barrister on Saturday. In giving his decision, he said that no incapacity was alleged against the claimant, except his being an assessor appointed under the Income-tax Commissioners. It was contended that he was disqualified under the 22d Geo. III., which enacted that "No surveyor, collector, comptroller, inspector, officer, or other person employed in collecting, managing, or receiving the duties on windows or houses, shall be capable of giving his vote for the election of any Member of Parliament." From the best consideration he had been able to give the subject, he had come to the conclusion that the claimant did not come within the disqualifying clause in the Act, inasmuch as the Income-tax was not a direct tax on houses, but on the income derived from them. It seemed to him that there is a wide difference between the house tax and the income tax. In his opinion the Act of Geo. III. should be construed strictly, and not taken to disfranchise any person not specially mentioned. As, therefore, he could not regard persons engaged in managing the Income-tax Act as being employed in managing the house duty, he did not consider them as coming within the disqualifying statute in question, and should allow the claim. In regard to the tender of light sovereigns noticed in our last, the Barrister has since explained that his decision did not apply to light coin, as there was no evidence that it was light; but simply to the fact that it had been refused without any proof that it was deficient in legal weight. He, therefore, considered it a legal tender, and had admitted the claim accordingly. —In Westminster a claim affecting many voters was disallowed: where a party, lodging in a house in which the landlord resided, claimed to be qualified to vote, on the ground that, though a lodger, he used his dwelling-room for the purposes of working at his trade, it was held that this was no answer to an objection of want of occupation, and the name was expunged. —In the City, the only decision of much importance was the case of a party who claimed as a liveryman of the Grocers' Company, but who was objected to on the ground that he had lived abroad for the last two years. The family of the claimant, however, resided in the City in the mean time. It was contended that there was no such residence in the case as could entitle the party to a place on the register. The revising barrister held, in a lengthened judgment, that the claim was valid. It appeared, from a variety of authorities, that a party was to be considered as *bonâ fide* resident who inhabited a house through his family, and who was thus subject to the public rates. That was the decision of various Judges, and it had always been acted on by committees of the House of Commons. He was bound to follow those authorities, and retain the name on the list.

Deanery of Westminster.—It has been stated in some of the daily journals, that the emoluments attached to this ecclesiastical preferment are more considerable than those derived from a bishopric. The existing revenues are about 3,000*l*. per annum; but a recent Act of Parliament has materially interfered with the interests of the dean and chapter. Until recently the government of the Abbey funds was vested in a dean and twelve prebends, who, after paying all demands, setting aside so much for repairs of the Abbey, and a certain portion for the ecclesiastical commissioners, divided the residue among themselves, the dean taking the larger share, and the prebends according to seniority. The new Act limits the number of prebends, who are now to be called canons, to six, after the number shall be so far reduced by death. All new canons will be paid a stipend of 1,000*l*., and the dean, instead of realising the princely income of his predecessors, will be limited to an income of 2,000*l*. per annum. The surplus is to be given to the ecclesiastical commissioners, who are to appropriate it to the building of new churches, and increasing the value of poor curacies. Dr. Ireland, the late dean, has by his will made the following bequests:—1,000*l*. for the Western Dispensary, after a life-interest therein in Islip; 2,000*l*. Westminster Hospital, after a life-interest therein in Westminster; 5,000*l*. for a chapel in Westminster; 2,000*l*. King's College, for promotion of religious education; 1,000*l*. Society now forming for the Education of the Sons of Clergymen; 1,000*l*. trustees for poor persons in Ashburton, his native town; 10,000*l*. University of Oxford, for a Professor of Theology; 2,000*l*. Oriel College, for an exhibition; besides many others.

The Wesleyan Conference.—The Conference has issued a general notice, directing that the first Friday in the present month shall be observed as a day of special fasting and humiliation in their societies; that public prayer-meetings shall be held that day in all Wesleyan places of worship on behalf of the commercial interests and the labouring poor; and that on the Sunday preceding that day, the ministers of their body shall, in their public discourses, enforce the duty of religious fasting, as connected in holy Scripture with the maintenance and improvement of personal religion.

Court of Common Council.—At a meeting of the Court last week, two interesting questions were incidentally discussed—the embankment of the Thames and the projected improvements in the neighbourhood of St. Paul's. Mr. Lott asked the Chairman of the Navigation Committee whether that part of their report which related to the embankment of the Thames had been taken into consideration? He stated, for the information of the committee, that Sir Frederick Trench had given notice that he would move in Parliament, next session, for a select committee on the subject of the Thames embankment, in order to show that the work might be done without making a demand on the public purse, in such a manner as to improve the navigation and beautify the banks of the river, and to promote the health of the inhabitants of the Metropolis. Mr. Walker, the engineer, in his report, as adopted by the committee, was of opinion that a splendid communication might be formed from Chelsea, or higher up, along the river, into the heart of the City, a communication which had excited much interest out of doors. An answer was promised to the question at the next court.—In regard to the improvements near St. Paul's, it will be recollected that about six years ago instructions were given by the court to the City lands committee not to take steps for letting any further ground at the west end of Cheapside till the further order of the court, as it was expected that the government would join with the City in throwing open a considerable space between the Post-office and St. Paul's Cathedral, so as to exhibit the cathedral to great advantage. Murmurs have, of late, been heard among the inhabitants of that district in consequence of the delay, and Mr. King gave notice of a motion, which was brought on last week, to rescind the resolutions, in order that the space might be filled up. He represented that a great deal of inconvenience resulted from the interference of the court to prevent the building of houses upon the spot. It was, he thought, extraordinary that Mr. R. L. Jones, whose voice was so effective in carrying measures of positive utility, should advocate the alteration to which he adverted, and at the same time refuse to exercise his influence in prevailing upon the court to widen Watling-street and other places of great traffic which were so narrow as constantly to endanger life and limb. Why was not Newgate-street widened? and why was not something done to improve the approaches from Coleman-street to the Guildhall? He could not account for such conduct as had been adopted with respect to the project of throwing open St. Paul's in any other way than by setting it down as a job. Mr. R. L. Jones said that Sir Matthew Wood, who was alluded to by Mr. King, was as remote from the idea of jobbing as any man that ever existed. Even those who were opposed to him in public life were ready to admit that fact. He regretted to see any symptom of a paltry spirit in any of the corporation, when an immense public improvement was in contemplation. For what purposes should the large funds of the corporation be expended, if not with the view of accomplishing splendid improvements? If they miserably refused to embellish the City with a liberality adapted to their means, the court might depend upon it that their extensive funds would be appropriated to that object by other hands. He had good reason for believing that her Majesty's Government would join with the City in effecting an improvement which every one must look forward to with hope, whose taste was not entirely brutalised. He looked with confidence to the court, in the belief that they would do themselves the high honour of negativing such a motion, and believed that the contemplated improvement would take place within two years. Alderman Wilson, Mr. Westwood, and others expressed their opposition to the projected improvement, but the motion for filling up the ground was negatived, on a division, by a large majority.

Custom House.—The inquiry into the recent frauds on the revenue is still in progress, and some startling disclosures are said to have been already made. The frauds discovered up to the present time are not, in the aggregate, confined to tens of thousands, but to hundreds of thousands of pounds. Indeed, it is said in some quarters that the revenue has suffered to the extent of nearly a million sterling. From the particulars published, it appears that some of the landing-waiters, who are in the receipt of salaries varying from 160*l*. to 400*l*. per annum, are the parties directly implicated. The principal business of these officers is personally to attend the landing of goods at the docks or legal quays. For this purpose each is furnished with a landing-book, issued from the Registrar's office, and containing copies of entries previously passed by importers for merchandise about to be warehoused, or at once delivered. These entries are of three classes:—1st, The warehousing entry for goods intended to remain in bond. 2d, The prime entry, which stipulates for the immediate delivery of the goods, the duty having been paid. 3d, The sight entry, the object of which is to assist the merchant in cases where goods arrived consigned to him without previous advice, when he is permitted to have the packages landed, upon declaring that their contents are unknown. It is obvious that the two latter descriptions of entry afford opportunities to these officers, if they are not persons of strict and unimpeachable integrity, to deceive and falsify the returns which they are appointed to make of the weight of and duty on merchandise landed at their respective stations, the interference of the landing surveyor, a superior officer, being only required in the settlement of tare, or in the approval or otherwise of the value put upon goods at the *ad valorem* rate. The mode adopted in the wholesale smuggling of silks was for the parties connected to send to the quays a case of toys, boots, or any other French import of low value, marked and numbered, for shipment coastwise, which, however, instead of being forthwith put on board, it was understood should be allowed to remain on the quay. When the French packets arrived a "sight entry" was taken out for cases marked, and numbered precisely in the same manner, the contents being declared to be "unknown." The packages were then landed at the same quay for examination by the landing officer. Immediately this was the case, the former package was recalled by an order to redeliver, when the cases by the French packets, which really contained silk, were substituted to the parties applying, and the packages of boots, &c., examined and returned for duty, in lieu of the cases of silk; the ship's manifest merely describing the case brought over as merchandise, and thereby being no check upon the fraud.

The Parks.—At Marlborough-street Police-office, on Tuesday, three lads were charged by the keepers belonging to Hyde Park with pelting at the chesnuts and acorns, and otherwise damaging the trees in the Park. The cases were alike against all three, with this exception, that the two first were found in a portion of the Park from which the public were interdicted, while the latter was in the open space. The park-keeper said there were boards in various places cautioning the frequenters of the Park against touching or damaging the trees and shrubs. Mr. Hardwick said it would be as well for the boards to contain the particulars of the punishment awarded by law against persons who wantonly damaged the trees and shrubs. For the first offence they were liable to a fine, not exceeding 5*l*.; for the second, 12 months' imprisonment; and for the third, seven years' transportation. The three lads were fined 20*s*., or ten days' imprisonment.

Fires.—On Saturday morning the premises of Mr. Fenton, the extensive glass-merchant, of West Smithfield, were, for the fifth time within the last few days, discovered to be on fire; and through the instrumentality of two firemen who were left on duty in consequence of the previous attempts, the guilty party has been detected. It appears that a son of Mr. Fenton, about 15 years old, went on Saturday morning into the back warehouse, and shortly afterwards called out that there was another fire. Finding this to be the case, suspicion fell on the youth. On searching him some lucifer-matches were found in his possession, and he ultimately acknowledged his guilt. He has been placed under restraint, thêre being great doubts as to his sanity.

East India House.—On Wednesday a Quarterly General Court of Proprietors of India Stock was held at the India House, pursuant to the terms of the Charter. A long debate was expected, as at the last and previous courts several notices of motion were given by various proprietors in reference to the expenses of the war in Affghanistan, the loans raised in India since the beginning of the war, the protests made against the war, and the case of the Rajah of Sattara. All these motions were withdrawn for discussion at the next court. Some additional notices were given for future meetings, and as there was no question before the court it was at once adjourned.

Public Meetings.—The adjourned meeting of the West India Steam-ship Company took place on Wednesday, for the purpose of considering the adoption of the Directors' report noticed in our last. An amendment was moved for the appointment of a select committee to inquire into the affairs of the company, but after a long and angry discussion, the amendment on a division was supported by only 16 proprietors, and the adoption of the report was carried by a majority of about 70. The business of the mails will therefore be continued on the modified principle to which we have referred in previous Numbers.

Sheerness.—Three first-rate, three second-rate, and four third-rate men-of-war are ordered to be brought forward at this yard, ready for commissioning. India and China were at first supposed to be their destination; but it is now stated that the Admiralty have it in contemplation to do away with the system of "demonstration ships," and to bring forward in lieu of them ten ships of the line at each of the three principal ports, viz., Sheerness, Portsmouth, and Plymouth, to be denominated "advanced ships of the ordinary." It is understood that these ships are always to be kept in such a state of readiness for commissioning that a force of 30 sail of the line, the majority being new ships, may always be ready for service on any emergency. This force, not being commissioned, will be no additional expense to the country, and, by being docked from time to time, will be preserved from that decay which many fine ships in ordinary have heretofore suffered. This advantage is expected to compensate for the small amount required to keep them in a properly efficient state; while the advantage will be gained of having such an imposing fleet ready equipped for sea in the space of ten days or a fortnight. This statement is confirmed by letters from Plymouth, which state that three first-rates and seven line-of-battle ships are likely to be brought forward there as "demonstration ships."—The inconvenience experienced by Her Majesty during her recent voyage to Scotland, on account of the comparatively slow progress of the royal yacht, has induced the Admiralty to order a steam yacht to be constructed forthwith, with every possible convenience for her Majesty's accommodation, whenever she may wish to take a trip to sea.

Mortality of the Metropolis.—The number of deaths registered in the week ending Saturday, Sept. 17, was—Males, 443; Females, 421: Total, 864. Weekly average, 1838-9-40-41—Males, 467; Females, 445. The distribution of this mortality in the different districts was as follows:—Western districts, 124; Northern, 147; Central, 178; Eastern, 205; Southern, 210.

Provincial News.

Berwick.—A few days since as one of the boats was engaged in the turbot fishing, about two miles to the eastward of this port, the fishermen were surprised by a fish of unusual shape and dimensions becoming entangled with their net; they took it up with some difficulty, when it proved to be a fine young shark. He measured eight feet in length by four feet eight in girth, and had all the characteristics of the species distinctly marked. The weight is supposed to be about 20 stone.

Bristol.—During the severe thunder-storm in this town last week, a serious accident occurred at the Great Weston Cotton Works. The lightning struck the meter-house, and completely destroyed the large gas-meter, the erection of which had just been completed by the company at a cost of 130*l.* The iron face was split in pieces, and the gas in the cylinder being ignited by the electric fluid, exploded; and large pieces of iron, one of them weighing above 100lbs., were thrown with such violence against a wall 25 feet distant, as to produce considerable indentations in portions of the masonry. The meter-house is erected in front of the weaving-room, in which between 500 and 600 girls were at work at the time, but they escaped without injury.

Deal.—Mr. Bush, the engineer of the new lighthouse on the Goodwin-sands, has made an examination of the works after the late gales, and reports, that notwithstanding the forebodings of many persons that the gale was such that the caisson never could survive, he has ascertained that it had not the slightest effect upon it, and that it remains perfectly perpendicular, after having been subjected for many hours to the violence of the storm. This being the case, he has not the least doubt of the ultimate success of the undertaking. Since the above was written, the Admiralty have sent their surveyors to make a report of the present state of the caisson. The survey was completed on the 24th, and the result was so satisfactory, that a government steamer has been sent to the Downs with the boring apparatus, for the purpose of assisting Mr. Bush in carrying out the undertaking.

Dover.—On Friday last a Dutch vessel, from Dort, landed in this harbour a freight of 43 oxen. This is the first importation of cattle into this place since the new tariff; and a regular periodical supply for the Canterbury and neighbouring markets is expected.—The magistrates of this town have received a long letter from the Secretary of State, on the subject of the late "hair-cropping" case, in which he desires that his "marked disapprobation of the jailer's conduct in that affair should be conveyed to him by the justices." This duty was performed on Friday by the visiting magistrates, although they had previously passed a resolution fully approving of the conduct of the jailer. The difficulties of the case do not appear to be yet disposed of, since Messrs. Fitzjames and Gladstone are expected to take legal proceedings for redress.

Exeter.—The large estates of Mr. Montague Parker, the late representative of the Southern Division of this county, were lately brought to the hammer by Mr. Robins, and one of the farms, upon which there is a lease of 14 years to run, and at a rack rent, sold for forty-two years' purchase.

Falmouth.—The effect of the tariff is becoming more evident in all the great ports. A fortnight ago 39 oxen were landed here from Corunna, and were sold by auction by the importers last week. None exceeded 700lbs. in weight, and the average was about 500lbs. The local papers state that they were all either cream or fawn colour, and about the head looked much like the buffalo. They were very deep in the shoulder, but thin in the hind quarter, and realised about 10*l.* a head. The highest price given was 14*l.* 5*s.*, and the lowest 6*l.*, being 40*s.* per cwt. The butchers of Falmouth were the principal purchasers; several farmers were in attendance, but made no offers, knowing little or nothing of the nature and habits of the cattle. On Saturday last 26 fine fat oxen were seen on board the steamer which touched at this harbour on her passage from Vigo to Southampton.

Halifax.—The local papers lately noticed the coincidence of the 73d Regiment having been sent down into Yorkshire some years ago after a disturbance, then sent abroad, and on their return being immediately despatched again into Yorkshire. A similar coincidence has again occurred this week. The 73d when sent abroad were replaced in Halifax by the 32d; and a company of the same regiment has again replaced the 73d on their being ordered to Wales.

Hull.—The graziers of North Lincolnshire and East Yorkshire are already suffering from the fall in prices caused by the importation of cattle into this port from Germany and Holland, and parties who have been in the habit of selling their stock at Barton and Hedon markets find the effects very serious, as Hull is in more constant communication with the exporting countries than any other port in England. On Sunday and Monday last there were imported into this harbour, from Hamburg, 62 large oxen, most of them of the Holstein breed, of large size and good condition. They were imported by a person of Leicester, and were sent off the following day for that county.

Lewes.—The great sheep fair last week felt the influence of the new Tariff. The graziers found the prices by no means satisfactory. Upwards of 40,000 sheep and lambs were penned. Ewes fetched from 17*s.* to 32*s.*, and lambs from 14*s.* to 22*s.* A grazier offered 20*s.* per head for 1,000 sheep; the offer was rejected, the seller expecting to get at least 30*s.* per head. At the close of the fair he would gladly have accepted the offer of the grazier, who then declined to give even 20*s.* per head, but was at last induced to take them at that price, 10*l.* being thrown off the 1,000*l.* to conclude the bargain. About 300 ewes were sold, averaging about 45*s.* The highest price obtained was 3*l.*; two years ago it was 9*l.*; and last year 7*l.* 10*s.*

Lincoln.—The local papers state that since the suspension of the Rev. T. S. Escott, the vicar of Gedney, in this county, "for the good of his soul's health and the lawful correction and reformation of his recent excesses, especially for refusing to bury the child of a dissenter," no church service has been performed in that large parish of 2,000 souls, although it pays an annual sum of 3,000*l.* in tithes to the rector and the vicar. Funerals are performed without any burial service being read, and all the religious offices of the church and parish are suspended like the minister.

Liverpool.—Further particulars have been received of the disastrous fire which we noticed in our last. It has proved by far the most serious conflagration which has occurred in this country for years. It appears that twenty warehouses and sheds for the reception of merchandise have been totally consumed, besides some cooperages, smithies, and workshops, and a quantity of timber. The calamity occasioned by it, and the loss of life which occurred, had caused a general depression in the commercial circles, which was increased on Monday night by a second outbreak of the flames. The alarm was given about ten o'clock, and in a few moments it was ascertained that the fire had burst out afresh from the ruins, and had reached a new range of sheds, about 25 yards in length. It gained head with surprising rapidity. For some time an extensive cotton-shed was in great danger, but the flames were subdued in time to save it. Several horses perished in the premises consumed. In the part destroyed by the first fire, thousands of iron hoops which had encased palm-oil casks have been found; both oil and casks were consumed, and the hoops alone remain. A number of smiths' and iron bars appear of a reddish colour, which shows that they must have been red hot. A committee, consisting of five insurance agents, has been appointed to manage the salvage, and settle the claims; they have not yet come to a satisfactory account of the actual loss; but the following is supposed by competent persons to be the amount of property in the warehouses at the time:—Cotton, 60,000 bales; turpentine, 100,000 barrels; flour, 12,000 barrels; and 4,000 tons of iron. The rumours current respecting the numbers that perished in the ruins say that 20 or 30 have been burned; but nothing certain will be known until the ruins are cleared away, and, in all probability, not even then. The amount of property insured has been ascertained to be 350,000*l.*; but it is generally believed that a large quantity was uninsured, and that the amount of damage sustained will exceed 700,000*l.* The inquest on the bodies of the men who died at the Hospital from injuries received at the fire, and which had been adjourned for the purpose of receiving further evidence respecting the origin of the conflagration, was resumed on Tuesday. After the usual evidence had been given, the coroner said that there was no certainty as to the precise spot or manner in which the fire commenced, and that its origin would probably never be discovered. It was clear, however, that Mr. Peniston, the owner of the concern, had not set it on fire, for none of his own property was insured, and the evidence satisfactorily proved that it could not have been his act. The jury returned a verdict in accordance with these remarks, fully exonerating Mr. Peniston of the charge that his premises had been purposely set on fire by himself, or by the neglect of any of his servants. Since the conclusion of the inquest a man called Doran, an Irishman, has been brought before the magistrates on the charge of having maliciously set fire to the premises. After a long examination, the particulars of which we shall reserve until the close, he was remanded for further evidence.—An extensive forgery has just been committed on the Branch Bank of England in this town, by a young man, named Barnsley, who forged two cheques in the name of respectable firms, and succeeded in getting one for 244*l.* cashed at the Bank. He has been apprehended in Wales, and committed for trial.

Manchester.—Nothing has occurred during the week to disturb the gradual and progressive resumption of labour by the power-loom weavers in this town, to which we alluded in our last. According to statements collected by the police, out of a total number of 6,884 weavers usually employed in 41 mills in the borough, 4,873 were at work in the forenoon, and 5,051 in the afternoon of Friday. The remainder, being now too few to offer any serious obstruction or annoyance to those who are in employment, and being consequently deprived of all hope of carrying their point, are rapidly returning to their looms. There is little doubt that in a few days the whole of the mills, except where some peculiar circumstances exist, will be in full work. In the surrounding district there is no change whatever; but it is believed that, with the exception of the mills at Bolton, and a few cases where peculiar obstacles prevent a resumption of labour, all are in full operation.—The inquest on the man who died of the wounds he received in the attack on a mill at Salford, a few days ago, terminated on Thursday. The jury were some time before they could agree on their verdict, which was "Justifiable Homicide." Twelve of them were for this verdict, and seven for manslaughter.—The adjourned meeting of commissioners in the bankruptcy of the firm of Raleigh and Co. took place on Friday, when the bankrupts surrendered. It was stated that the bank of Manchester has claims upon the estate to the amount of no less than 180,000*l.*

Newcastle.—On Saturday, his Royal Highness the Duke of Cambridge, accompanied by Lord Ravensworth, Lord and Lady Barrington, &c., visited this town. The Mayor, Aldermen, and Council, assembled in the hall of the Philosophical Society, to receive his Royal Highness, and an address was presented with the usual formalities. which his Royal Highness acknowledged in suitable terms. An address was also presented from the Mayor and Town Council of Gateshead, and received with the usual acknowledgments. His Royal Highness visited St. Nicholas' Church, the Central Exchange News Room, the Exhibition of Pictures, and the Markets, and expressed himself much pleased with the town.

Newport.—The proceedings of the parishioners of Newport, in the Isle of Wight, in regard to church rates, which they have refused for five years past, have been frequently before our readers. An evening paper now states, that in consequence of the inability of the churchwardens to repair the church, the fabric is in such a dilapidated state that it has been declared unsafe to perform divine service in it; and the service, accordingly, has been formally suspended. It adds that, for some time past, persons sitting in some parts of the church have often held umbrellas over their heads during divine service, to shelter themselves from the rain.

Oxford.—The Martyr Memorial is nearly finished, and shows to great advantage on entering the city from Banbury or Woodstock, at the point where the two roads join, as it there appears in the distance between the trees which form the avenue on the north side of Oxford. It is said that the prints of the Memorial do not give a correct idea of its proportions; and that in order to see the monument to advantage, the spectator should view it at the distance of at least a hundred yards from its base. The scaffold was wholly removed a few days ago, but another has since been erected, for the purpose of executing some carved work on the upper part. Very extensive repairs and alterations of the library are in progress at Queen's College, consequent on the munificent bequest of the late Dr. Mason, who left 30,000*l.* for the purchase of books for the augmentation of the present collection. Dr. Mason, who died last year, also left 40,000*l.* to the Bodleian Library. During the present long vacation very considerable repairs and restorations have been going on at Christ Church, All Souls, and St. John's Colleges.—The late Dr. Ireland, Dean of Westminster, has bequeathed 10,000*l.* to this University to found a Theological Professorship, and 2,000*l.* to Oriel College for an Exhibition.

Portsmouth.—Since our last notice of these operations the work has been going on with equal vigour, six divers being employed every slack tide, and with great success. The total length of keel now removed is 63½ feet, being more than one third of the whole length. The quantity of iron ballast recovered is 90 tons, which some suppose to be two-thirds, others about one-half, of the probable quantity on board when the vessel went down. Of this iron, corporal Jones, whose success as a diver has excited general admiration, sent up three tons in one day, and more recently he sent up 151 shot of various sorts in the same time. The quantity of shot recovered since the commencement of the operations is estimated at 11½ tons.

Shoreham.—A sale of wines, &c., recently took place at the Custom-house of this place. Among the articles sold was the hull of *Le Marie Alexandre*, which was wrecked last January, having been abandoned by the crew, who were never heard of. When towed into Shoreham harbour, she was found to be laden with brandy and mustard seed. The vessel at the sale was recognised by an old English captain, as one that some years ago he was compelled to abandon in the Bay of Biscay. She was then engaged in the London wine trade, and on that occasion drifted over to the French coast, was repaired, and registered in France. The English crew were saved, but it may now be considered certain that the Frenchmen all met a watery grave.

Southampton.—The daily papers have given long accounts of some extraordinary depositions made by a Chartist of this town, named Pierce, relative to an alleged conspiracy to murder the Queen, his refusal to take an oath of secrecy, and the attempts made to assassinate him. These statements have naturally created some excitement, and an incredulity in the minds of many as to the actual facts. The enormity of the crime excited this feeling of disbelief; but the story was sworn to before the borough magistrates, and so impressed were they and the authorities at the Home-office with the idea that it was not all fiction, that Government has offered a reward of 50*l.*, to which Pierce has added another 50*l.*, for such information as may lead to the apprehension of the assassin. Some of the papers call the story a mare's-nest, while others doubt the credibility of the principal witness, and consider the whole proceeding as a political fabrication.—The local papers, in reference to the late robbery at Lady Lisle's, alluded to in a previous Number, state that Barnes, the butler, has been remanded on the charge of robbing her Ladyship of jewellery, plate, and cash, of the value of between 2000*l.* and 3000*l.* From the evidence it appeared that the butler, gardener, and a maid servant were concerned in the robbery. The butler, who is a married man, had latterly made arrangements to leave the country, as soon as the robbery had been effected and the booty secured. A statement of the gardener first caused suspicion to rest on the guilty parties.—We regret to observe by the daily papers that Capt. Basil Hall was landed here on Thursday, from the Havre packet, in a precarious state of health, having had an attack of paralysis.

Stafford.—The special commission for the trials of the prisoners charged with offences connected with the late destructive riots will be opened this day. The Judges on the occasion will be Chief Justice Tindal, Baron Parke, and Baron Rolfe. On Monday one Court only will be opened, but on the succeeding day there will be three Courts open. The prosecutions will be conducted by the Solicitor-General, Sir W. Follett, Sergeant Ludlow, Sergeant Talfourd, &c. Mr. Maule, the Solicitor for the Treasury, prosecutes for the Crown. There are upwards of 250 prisoners in the county jail, besides those who are out on bail.

Stroud.—The daily papers announce that the Woodchester property, near this town, one of the fine estates of the Earl of Ducie, is coming into the market early in the spring. It is, probably, the largest estate that has been subject to public competition since the sale of Lord Ormonde's property in 1815. His estates were sold by Mr. George Robins for 500,000*l.*; and it is said he expects to obtain for Lord Ducie's more than 300,000*l.*

Sunderland.—The American diver, Smith, having been released from the custody of the police who apprehended him after his first leap from Sunderland-bridge, took another leap last week amidst a great crowd of spectators, but it nearly cost him his life. The height is upwards of 110 feet, but he darted into the water without fear, and afterwards rose apparently in a very exhausted condition. On being brought ashore he was seized with convulsions, when it was found necessary to bleed him. At first the blood flowed slowly, and black, showing that congestion had taken place in the lungs. He suffered for some time from nervous exhaustion, but ultimately rallied. It is now believed that a third attempt will prove fatal. On Friday evening, a tailor of this town, in a drunken freak, declared that he would rival Smith, the diver, by jumping off the bridge. He was followed by a person who had heard him boast of his intention, who endeavoured to persuade him not to do so, at the same time considering that he would not attempt it. In this, however, he was mistaken, as the tailor pulled off his coat and jumped from the bridge into the river. He was picked up by the police boat and taken to a neighbouring house, when it was found that he had received such injuries from the fall as to leave no hope of his recovery; he died the same night.—On the 21st ult. several waterspouts were seen off this coast, about ten or twelve miles from the land. They assumed the appearance of inverted cones, about 300 feet high, and ultimately burst; an immense body of water fell from each. The lower parts totally disappeared, and the summits amalgamated into a dense body, resembling a thick cloud.

Warminster.—At the meeting of the South Wilts and Warminster Farmers' Club last week, among the labourers who obtained prizes for good conduct was an old man who had arrived at the age of fourscore and two, and who had lived in the service of the chairman, Mr. H. Biggs, and his father, for the long term of sixty years. In presenting the certificate to this aged servant, the chairman struggled hard to repress his feelings; the old man, too, was overpowered, and the company sympathised with both. At length the chairman said, "James Sturges, you have been a faithful servant to me, and to my father before me. I believe you have never lived in any other service. Take this as a slight testimony of your good conduct." The daily papers ask, where, but in England, are societies of gentlemen assembling for such a purpose, or such candidates for their honours?

Waltham.—The annual meeting of the Waltham Agricultural Society, which includes within its district all villages and towns within 10 miles of Waltham—viz. 85 in the county of Leicester, 20 in Lincoln, 13 in Nottingham and 11 in Rutland—was held on Monday, and was attended by a most numerous and influential company. The show of stock on this occasion was remarkably good, and excited much attention and interest from the numerous classes of agriculturists who were assembled at the gathering; but the feature of the meeting to which we would particularly allude, was the speech of Mr. Everett, the American Minister, at the dinner which followed. The Duke of Rutland presided, and about 300 gentlemen were present on the occasion. In acknowledging the honour paid him by drinking his health, Mr. Everett alluded to the conclusion of the recent treaty, expressing his belief that the claims on both sides had been maintained with great ability, and a thorough conviction of right; and that their honourable and just settlement was creditable to the distinguished negotiators of peace, advantageous to both countries, and auspicious of a more intimate connexion. Henceforth, he trusted, there would be no emulation, and no rivalry, but in those beneficent arts of peace which reflected the greatest glory on states, and the greatest credit on human nature. For what was that which constituted the chief pride and glory of the British nation? He had heard of the intercepted letter from one Chinese chieftain to another; and what was the characteristic which had excited the admiration of the mandarin of a great and important empire, reeling at the time under the blows of the British Government? Was it the military prowess of their countrymen? Was it the steam-vessels of war reaching coasts in defiance of the desolating simoom? Was it their arms—their artillery—their skill in engineering, which civilised nations now brought to the strategy of war? Was it this, or any of these, which had struck with wonder, and awe, and admiration the barbarians of China? No; it was the humanity of British physicians and surgeons—their management of hospitals, and the generous kindness which was extended to the sick and wounded, even of a hostile nation—which moved them with astonishment, and excited their sympathy and regard. These were some of the arts of peace which extorted the admiration of an enemy, and which other states would do well to imitate. With reference to that art which they were then assembled to promote—the peaceful art of agriculture—it was the handmaid of an overruling Providence, appointed by him, and spread out three times a-day a table at which all the tribes of animated nature and man himself should be fed. In cultivating this art, he trusted that the friendly relations which had now been ratified would lead to an interchange of thoughts, and instruction, and practical results between England and America. They would remember, however, that, as compared with Britain, his was but a new country, to a vast extent unsettled, and in a state of nature; the Government were large proprietors of domains, and much of the land was sold at no more than 5*s.* per acre for the fee simple. It was, therefore, in the nature of things, that young and enterprising farmers, instead of remaining long on one spot as tenants, went off to the west country, and became proprietors of plantations themselves; hence there was not that finished completeness in agricultural operations which might be observed on the farms in this country. Then the climate of America differed much from that of England; the summer there was hot, and a great breadth of Indian corn or maize, which formed the staple food of the people, was rapidly brought to maturity; the winters were much longer and colder than in England; and hence the turnip and other cultures which formed in Britain the basis of much agricultural thrift could not be conducted in the United States. There were notwithstanding many points connected with the use of implements and the general care and tillage of the soil on which much useful information might be diffused and discussed. Kindred as the two nations of England and America were in origin—resembling each other more than any two nations in the history of the world ever did—he trusted that a friendly feeling would always exist, and he was assured that great benefit would be derived by a free communication of ideas from one side of the Atlantic to the other. There was one topic to which, with every desire to avoid political discussion, he wished to refer; he alluded to the recent modifications of the duties on the importation of grain, and their probable effect on the commercial intercourse between Great Britain and the United States. He (Mr. Everett) concurred in opinion with those who thought that it was much too early to foresee what effect the new scale of duties would produce on the American markets. He did not think, whatever might be the case with other states, that America would be the nation to reap benefits from those modifications. She was too remote, he considered, to take advantage of those changes. Neither did he think, from a studious attention to the averages, that any great injury need be apprehended by the British farmers from an influx of American grain. It was, perhaps, possible, when a great supply was needed by this country, that then America might get some share of the trade in the shape of flour. But one thing he would wish them most emphatically to observe, what America sent to England in corn or flour, be it little or be it much, she would take back in the products of British industry; and in this respect the trade of the country which he had the honour to represent differed from that of Continental states, whose importations of grain, it had been complained, had caused a drain of bullion. So far from this being the case with the United States, the manufactures of Leicester and other English towns would pay for the produce of the American fields. He was not practically engaged in the culture of the soil; but it was his business to cultivate a good understanding between England and America, and that duty he must not neglect. His first duty, of course, was to his own Government and his own country; but he felt that he was best discharging that duty by endeavouring to promote a good understanding and an amicable feeling between the two nations, and especially, now that an honourable adjustment of those differences which threatened a partial interruption of that harmony had been effected, he should labour more successfully to cherish and extend throughout his own land kind feelings towards those among whom he resided. Again he thanked them most cordially for the warm welcome with which he had been honoured, and in acknowledgment for that reception he would once more express his fervent wishes for the prosperity and happiness, not only of that district, but of every part of England. He sincerely trusted that they would all be prosperous, and that those whom he then addressed might be more especially prospered in that great and beneficent art of agriculture which formed, as it were, a common bond of union between the possessor of estates, whose titles ran back to the time of the Norman Conquest, and the humble labourer—between the noble who lived in princely towers, and the lowly tenant of the thatched roof which spreads beneath their shelter.

Windsor.—On Friday last the 2d Life Guards were reviewed in the Great Park by the Archduke Frederick of Austria, accompanied by Prince Albert and a numerous staff. On their Royal Highnesses taking their station in front of the royal standard, they were received by the regiment with the usual salute. They then proceeded to the right of the regiment, and passed through the ranks. The regiment afterwards went through a series of evolutions, after which the Archduke and Prince Albert complimented Colonel M'Douall on the fine appearance of the regiment. A review of the 15th regiment was appointed to take place on Tuesday, but was necessarily postponed in consequence of the heavy rain.—The new royal mews at Windsor, for which a Parliamentary grant was obtained, will be ready for the reception of her Majesty's stud at the end of the present week, when the horses will be immediately conveyed to their new quarters.—Four beautiful Spanish horses arrived at Windsor on Thursday, as presents from Queen Isabella II. of Spain to her Majesty. They reached this country shortly after her Majesty had left for Scotland, and were landed at Woolwich, where they remained till her return. They are about 14 hands high; the tails reach to within an inch of the ground, and are perfect curiosities from their extraordinary size and extreme fulness. The manes of the four are also full and long, flowing to the length of 14 inches over either side of their necks. Their heads and necks are peculiarly large and full, much resembling the horses of Flanders and those bred in the Low Countries.

Worcester.—The annual celebration, usually known as "The Meeting of the Three Choirs of Worcester, Gloucester, and Hereford," for the present year, took place on the 20th, 21st, 22d, and 23d ult. The selections presented some new features. On the first morning, service was performed as usual at the Cathedral, and a sermon preached by the Bishop of the diocese. The musical portions of the service comprised Handel's "Dettingen Te Deum" and his "Jubilate," Dr. Croft's anthem "Sing unto God," and Handel's Coronation anthem "Zadok the Priest." The second morning's performance was the "Messiah," that of the third day was the "Judas Maccabeus," and that of the fourth was a new adaptation of Beethoven's "Mount of Olives," called "Engedi, or David in the Wilderness,"—an alteration which was made to remove the obstacles which have hitherto existed to the performance of the work in its original form. This was followed by a miscellaneous part, comprising songs and choruses by Handel, Mozart, Haydn, Mendelssohn, Guglielmi, Dr. Chard, and G. Perry. The evening performances consisted, on the first evening, of Handel's "Alexander's Feast," and a miscellaneous part; and the second evening, of Haydn's "Seasons;" and on the third evening, of Romberg's "Song of the Bell," and a short miscellaneous selection. The whole of the performances went off successfully, and the total amount of subscriptions for the benefit of the widows and orphans of the Clergymen's Charity was 1,014*l.* 16*s.* 2*d.*, being 100*l.* more than in 1839, and 206*l.* more than in 1836. The expenses, notwithstanding the extent of the choir, were much less than they were when three or four foreign singers were engaged on enormous terms, whose services, generally, were available only at the evening concerts, which, latterly, failed to attract even tolerable audiences. The experiment of employing native talent only has perfectly succeeded, and will in future be acted upon both at Hereford and Gloucester.

Railways.—The following are the receipts of railways for the past week:—viz., Birmingham, 18,062*l.*; Great Western, 14,661*l.*; South-Western, 7,133*l.*; South-Eastern, 1,518*l.*; Hull and Selby, 1,100*l.*; Blackwall, 926*l.*; Croydon, 343*l.*; Edinburgh and Glasgow, 3,008*l.*; Eastern Counties, 1,170*l.*; Midland Counties, 3,205*l.*; Brighton, 4,499*l.*; Birmingham and Gloucester, 2,161*l.*; Greenwich, 762*l.*; Great North of England, 1,432*l.*; North Midland, 5,738*l.*—It will be seen from the above returns that the raising of the fares on the Blackwall Railway has led to a falling off in the receipts of nearly 200*l.*, as compared with the corresponding week of last year, although the present season is far more favourable to pleasure trips than the last.—The West London Railway Directors have determined to relinquish their claim to compensation for services from the 1st January last, stating their willingness to continue the duties of office without remuneration till the completion of the undertaking, should it be further proceeded in. One of the new Directors has taken his seat at the Board, and it is now stated, should the other two be speedily brought in, there may be some chance of the business of the company being actively resumed.—A meeting was held on the 20th ult., when a motion was brought forward for the renewal of the proposal of the proprietors of the Cheltenham Union Railway to the Board of the Great Western Company to purchase the finished portion of the line, as their finances are at a very low ebb. By their balance-sheet it appears that they are in debt to their treasurers and bankers to the amount of 44,591*l.* It was contended that it would be useless to rely any further on the estimates of the Engineers for completing the line, as nearly all the subscribed capital had been already expended, and that the company ought not to incur any additional expenses of which the results were problematical. The better course, it was suggested, would be to receive the profits of the part of the line at present in traffic, and divide that among the proprietary as a return for capital now invested. The whole subject was subsequently left to the discretion of the directors, who are to continue negotiations with the Great Western Railway, and lay the result before a meeting to be called at a future period. In answer to a question from a shareholder, it was stated that the dividend to be declared at the next half-yearly meeting would be at the rate hitherto paid.—The project of the Plymouth and Exeter Railway does not appear to receive that support which its importance to so great a naval arsenal and to the inland towns through which it is intended to pass might be expected to command. Three engineers have given in estimates of the cost necessary to carry out the undertaking, and these have met with the concurrence of the provisional directors, who, however, do not think themselves justified in commencing the works till some more unanimous expression of feeling has been made by those parties whose business interests are identified with the undertaking, and who are expected to become its supporters. The report prepared concerning the progress of negotiation was deemed satisfactory; but distinctly stated that unless the townspeople come forward and liberally subscribe for shares, no important movement can be made. A meeting of the inhabitants of the three port-towns, and of the landholders in the neighbourhood, has been convened for this week, and the result will probably decide the question. —We recently announced that the Dover Railway Company opened their line to Headcorn. It appears that the directors soon discovered that material difficulty would arise in enabling the Dover and Ashford coaches to communicate with the station, in consequence of the narrowness and bad state of a parish road connecting the turnpike roads. The difficulty could only be met either by sending the traffic a considerable distance round, or by passing through Surrenden Park. Sir Ed. Cholmeley Deering, on a representation of the matter, liberally granted permission for the coaches to pass through his avenue and park. It was a concession of no ordinary character, as the road passes for upwards of a mile though the grounds, and close to the family mansion.—The long-pending question respecting the rating of the Great Western Railway has been decided at the sessions at Corsham. The presiding magistrate stated that Sir John Awdry had made a variety of calculations on the subject, and at a private meeting of the justices had stated to them his reasons and calculations, in which the other magistrates entirely concurred, and they had accordingly come to the conclusion of adopting the principles laid down by Lord Denman at the late contested case in the Court of Queen's Bench, but reducing the sum at which the company were assessed from 1,450*l.* to 900*l.* per mile. The officers of the company thanked the bench for the trouble they had taken, but thought it a very unsatisfactory result, and applied for costs. The bench stated that the decision was final, so far as they were concerned, and that each party ought to pay their own costs. The rate was then amended in accordance with this decision.—On Tuesday it was currently reported that a serious accident had occurred to the up-mail train on the South-Western Railway. It appears that the mail train was detained near Basingstoke for two hours, owing to some derangement of the machinery; but no lives were lost, and no person sustained injury.

IRELAND.

Dublin.—The doubtful question respecting the representation of the University is at length decided by the withdrawal of the Solicitor-General. The papers state that a long conference took place on Saturday between the Solicitor-General and the leading members of the College committee, from which the requisition to the learned gentleman emanated; and the final agreement between these parties was, that in consequence of the early and successful canvass of Mr. Hamilton, the committee should not present the requisition to Mr. Smith, and that he should write letters to the Rev. Dr. Todd and Mr. Hamilton, intimating that he has determined not to come forward to contest the representation of the University at the next election. A variety of rumours are current as to ulterior arrangements; among others it is stated that the Recorder, Mr. F. Shaw, is to accept the vacant mastership in Chancery, and vacate his seat in the University, in order to make room for the Solicitor-General.—We regret to announce the decease of Sir Michael O'Loghlin, Bart., the Irish Master of the Rolls, which took place on Wednesday evening, in George-street, Hanover-square. Sir Michael had visited London for medical advice. He was appointed to his judicial office about six years ago, and was in his fifty-third year. He has left a family of several children.

Belfast.—The increase of duty in France does not yet appear to have seriously affected the linen-yarn trade in Ulster. The papers state that a Belfast linen-yarn spinner sold last week to a Leeds house, to be shipped to Leeds, 20,000 bundles of yarn. In addition to this gratifying proof of the advantages Belfast enjoys in the linen trade, it is said that taking the manufacturing districts of the north of England, of Scotland, and of Ireland, the only mills working full time are those of the Belfast district. The Belfast papers contain accounts of meetings held on Shonahill, near Waringstown, for the purpose of procuring higher wages for the weavers and other operatives in the district. At one of those meetings there were 2,000 persons assembled, and bonfires were lighted at night on the summit of the hill. No act of violence was committed, and nothing occurred but the adoption of resolutions for an advance of wages.

Munster.—Mr. O'Connell has addressed a letter to the people of Munster on the subject of repeal. After recapitulating the usual arguments on the subject, he declares that Justice to Ireland requires these things:—1, The total extinction of the tithe rent charge. 2, The protection of Irish industry, and the promotion of Irish manufacture. 3, The fixity of tenure of land, in order to encourage agricultural improvement, and recompense the tenant for his labour and capital. 4, A complete representation of the people in the Commons House of Parliament, by the greatest possible extension of the suffrage, and by the protection of the ballot. 5, The abolition, or entire beneficial alteration, of the Poor Laws; and 6, The repeal of the Union.

Roscommon.—The effects of the tariff are already evident in Ireland; black cattle have declined in price at least 3*l.* a head. At the fair of Ballintubber, one of the best in this county, very few purchases were made, and even those at a considerable reduction. In fact, graziers could scarcely get the price they paid in May last. Sheep were equally reduced in value, although a few lots went off well; 1*l.* 15*s.* each were given for a small lot of fancy ewes, and the same price for two lots of wethers, which would have fetched 2*l.* a year since; 11*l.* 10*s.* each were given for bullocks, and 13*l.* 10*s.* a head for more inferior stock last year. There were very few good horses offered for sale, and very few purchasers.

King's County.—The fair of Banagher, the second in importance in Ireland, has just terminated, and the results are equally interesting in connexion with the new tariff. The numbers of sheep exhibited amounted to about 20,000. All the best quality were eagerly and quickly bought up, and of such description there was not a sufficiency for the buyers, the prices ranging from 28*s.* to 48*s.*, or 5½*d.* a-pound alive, which were prices nearly equal to last year. Ewes were not in such demand, but sold better than holders had reason to imagine, at about 3*s.* below the prices of this time twelvemonth. The cattle fair was anticipated to be a bad one, as it proved to be. Out of nearly 3,000 head of cattle scarcely 500 changed owners, at prices fully 2*l.* each below last year's valuation; buyers did not appear, and the fair is described in the local papers as little better than an exhibition.

SCOTLAND.

Edinburgh.—Among the many anecdotes connected with the Royal progress which are mentioned in the Scotch papers, it is related that when her Majesty was passing between St. Ninians and Bannockburn, she observed the Royal standard of Scotland, which Mr. Murray, of Polmaise, had caused to be erected at the Bore Stone, and from its solitary position, she asked Mr. Dunlop, the captain of the Campsie troop of yeomanry, what it meant; when she was informed that it stood upon the spot upon which the Bruce's standard stood at the battle of Bannockburn.—The accuracy with which Her Majesty's progress during her journeys in the North was timed, has frequently been the subject of praise. The "Scotsman" of last week observes, in reference to the subject, that when the number of horses and individuals having charge of them are considered, it is surprising that only in one instance (at Linlithgow), and that only for a few minutes, did the slightest delay occur. There were no fewer than 656 post horses engaged in conveying Her Majesty and suite to and from Taymouth. From Dalkeith to Scone, 164; Scone to Taymouth, 152; Taymouth to Drummond Castle, 136; and from Drummond Castle to Dalkeith, 204—in all 656 horses.—Among the jokes to which the civic dignitaries of Edinburgh have been exposed on account of their late rising on the morning of the Queen's landing, is the publication of a set of quadrilles under the title of "Johnnie Cope's Quadrilles," and consisting of the following appropriate airs:—Hey Johnnie Cope; We're a' noddin'; Up in the Morning's no for me; Get up and bar the Door; Ye watchful Guardians of the Fair; Carle, now the Queen's come.—The Society for the Blind, on the occasion of Her Majesty's visit, knitted a hassock, in silk and worsted, for a sofa-pillow, and a play-ball for the Prince of Wales. They were presented at Taymouth Castle, when Her Majesty commissioned four similar ones to be made, besides sending a donation to the institution.—There is at present so great a scarcity of water in Edinburgh that many families have great difficulty in obtaining sufficient for the purpose of cooking; and the workhouses and hospitals are almost unable to carry on their ordinary duties in consequence of the deficiency.

Glasgow.—A vessel arrived here, on Friday last, from Russia with a cargo consisting partly of a large number of barrels of Russian beef and pork, which can be retailed, after paying duty and affording profits to the importers and retailers, at less than 4*d.* per lb. The beef is of excellent quality. A quantity of American beef is also ready here in bond, and will be sold yielding a profit to all concerned. The harvest has terminated most satisfactorily in all parts of Scotland. Along the whole range of the Clyde, from its source downward, upon the holms and early lands, there is scarcely a stook to be seen out, and the appearance of the barnyards indicates what an abundant return the farmer has had.—A serious riot took place in Airdrie on Friday night, attended with destruction of property. It seems that on Wednesday the military, so long stationed in this district, were withdrawn, and this circumstance, added to reports of a renewal of riots in the neighbourhood, put the town in a very unsettled state. In the afternoon, on the arrival of five prisoners, who had been apprehended on a charge of intimidation, the shopkeepers, who were apprehensive of a riot, shut their shops. They were taken to an inn, which a large band of colliers soon surrounded for the purpose of a rescue. The house was attacked, the furniture thrown into the street and destroyed, and the prisoners liberated. Before this was accomplished, the magistrates met, and read the Riot Act; but, as they had no force at their command, they were obliged to remain passive during the time the destruction was going forward, without being able to put a stop to the lawless proceedings. Before the house was gutted, several shots were fired on both sides, but without effect. On Saturday morning a troop of cavalry arrived in the town, and no disturbance has since occurred.

The Orkneys.—Four hundred and sixty whales were captured last week at Westray, in the Orkneys. They are of a small size. A Kirkwall merchant immediately gave the fishers 500*l.* for the result of their day's labour. —Another capture of fifty whales has been made at the Island of Fiday, which have been disposed of to some merchants for 102*l.*, about 2*l.* each; double the amount obtained for the 671 caught at Westray. A shoal of from four to five hundred whales appeared close to the bay on Sunday. The whales already caught will, it is thought, bring into the islands no less a sum than 2,000*l.* This will make up, to some extent, the failure of the herring-fishing.

THEATRICALS.

HAYMARKET.—A new farce was produced at this theatre on Saturday, by the author of "Alma Mater," which we noticed in our last. Its leading character is a poor author, *Mr. William Shakspere Dibbs*, who is engaged in raising the needful by writing the "Tragical History of Mrs. Brownrigg," and at the same time endeavouring to get himself installed as secretary of the Anti-Matrimonial-Double-Action-Non-Population Society. Meanwhile, *Sir Terence Velvet* is leaving town for his borough, and addresses a series of instructions to an agent whom he has never seen, for the conduct of his metropolitan affairs. This letter falls into the hands of *Dibbs*, who, with the greatest coolness, inducts himself into the agent's office, which he fills very much to his own satisfaction, answering applications, transacting business, and embroiling matters until *Sir Terence's* return, when, of course, all explains itself. However, chance favours him: *Sir Terence* finds all right in political matters; *Dibbs* remains his agent, and marries a lady of quality; whilst a marriage which he has encouraged between a *Major Blunt* and *Sir Terence's* daughter is arranged satisfactorily at the same time. Mr. Webster acted *Dibbs*, and the piece passed off with good-humour. The dialogue was occasionally smart; the object of raising a laugh was gained, and the audience welcomed the announcement of its repetition until further notice. —On Tuesday, a new piece in two acts, called "Grandfather Whitehead," written by Mr. Mark Lemon, and adapted from the French, was produced at this theatre. *Grandfather Whitehead* (Mr. Farren) has been ruined many years before by the artifices of *Langley*, a retired trader (Mr. Stuart), who was partner to the old man, and whom he had saved from death when a helpless orphan, and reared as his own child, finally making him a partner in his firm. *Langley* is represented as suffering under bodily illness, and stricken with remorse for his past misdeeds, but still wanting moral courage to repair them. After his misfortunes, *Whitehead* resides with his son-in-law, *Drayton*, a builder (Mr. Tilbury), a widower with two children, *Louisa* (Mrs. Edwin Yarnold), and *Edward* (Master George Webster). In these children the grandfather's heart is wrapped up, and his greatest pleasure is to expend his means in toys and books for the young boy, and trinkets for the elder girl. As the whole interest of the piece centres upon this incident, we shall not pursue the plot, further but simply state that it terminates in the grandfather's reconciliation with the man who ruined him, and by whom he is restored to affluence. The piece is full of feeling, and bears a delightful character of truth. Mr. Lemon's plays are generally marked by their good taste; and this one appeals so directly to the heart, that it deserved what it received—complete success. The acting was excellent. Mr. Farren's character was peculiarly adapted to him, and he never so completely realised the perfection of acting. In every respect it was a finished and effective portrait, elaborated with a purity of expression, yet firmly and strongly drawn. Nothing can be imagined more exquisite than the manner in which the good-nature and kind-heartedness of the old man was represented. It was conceived and executed with masterly skill. His doting affection towards his little grandson, the pretended severity with which he reproved him, while delight was bursting forth at every feature, the infantine simplicity with which he entered into the child's sports and wishes, the defence of the boy against the indignation of his father, made up a complete picture of kind-hearted imbecility. A smile would involuntarily force itself when the brow tried to assume a frown; and the delicate sensibilities of *Grandfather Whitehead* made him an individual character, that we may look back upon and remember when a host of commonplace personages have been forgotten. No actor ever more justly merited the enthusiasm of the call which summoned Mr. Farren before the curtain, or the applause which rung from every corner of the house at the conclusion of the piece. It was announced for repetition every evening, and there can be no doubt that it will long remain a favourite.

DRURY LANE.—This theatre opens this evening, under the management of Mr. Macready, with the play of "As You Like it," and a new farce. A prize of 10*l.*, offered by Mr. Macready, for the best song and chorus in "As

You Like it," has been awarded to Mr. Henry Smart, nephew of Sir George Smart, the composer.

SPORTING.

NEWMARKET FIRST OCTOBER MEETING.

Tuesday.—*Match.*—The Duke of Bedford's Oakley (Robinson) beat Lord Exeter's Abydos, both four-yr-old. T.Y.C. 200, h. ft. 6 to 5 on Oakley.—Won by a head; Abydos swerved near home, or he would have won.

The Buckingham Stakes of 300 sovs. each, h. ft., for the produce of mares covered in 1839. T.Y.C. One to the post. (11 Subs.)—Won by Col. Peel's Murat (Nat.); beating Lord Exeter's br. c. by Velocipede. 2 to 1 on Murat, who made all the running, was never caught, and won in a canter by two lengths.

The Grand Duke Michael Stakes of 50 sovs. each. A.F. (22 Subs.)—Won by Lord George Bentinck's b. c. Misdeal (Rogers); beating Lord Exeter's Revocation, Lord Albemarle's c. by Plenipotentiary, out of Antiope, and Mr. Greville's Canadian. Betting—7 to 4 on Canadian, 5 to 2 agst Misdeal (taken). The Antiope colt made the running, followed by Misdeal and Revocation into the bottom, where they went up, Canadian at the same time reaching the front; the moment, however, that the latter faced the hill he gave up, and Misdeal taking the lead half way up the cords, won easily by two lengths.

Match.—Lord Albemarle's Buffalo (Robinson) beat Mr. Osbaldeston's The Devil-among-the-Tailors. Any odds on Buffalo, who won by nearly a distance.

Match.—200, h. ft., and only 25 ft., &c.—Duke of Bedford's John-o'Gaunt received 25 sovs. ft. from Mr. Osbaldeston's Skipton, A.F.

The Hopeful Stakes of 40 sovs. each, h. ft. (13 Subs.) Last half of Ab. M.—Won by Capt. Colquett's Pickpocket (E. Edwards); beating Duke of Rutland's f. by Bizarre; Mr. Ford's f. by Poison; Lord Albemarle's Tilcho; Col. Peel's c. by Slane, and Lord Exeter's f. by Sultan or Reveller. Betting—2 to 1 on the Bizarre filly, 4 to 1 agst Pickpocket, 4 to 1 agst Poison, and 4 to 1 agst Tilcho. Pickpocket made all the running, and won cleverly by a length. A dead heat for second, Tilcho a respectable fourth, and the others beaten off.

Wednesday.—For the D. M. Handicap this afternoon only three horses were named, Saros, Rosalind, and the Manto colt, and, the first two having been scratched within the time prescribed by the conditions, the race was void. The T. Y. C. Handicap did not fill, and Johnny having paid forfeit to Ralph, a list that at one time looked like four races at least, was reduced to a match; and a D. I. Plate, with three entrances. The members seem to be reserving themselves and their horses for the Second October and Houghton Meetings, for which great things are promised. Of the two events decided this afternoon the following are particulars:

Match—100, h. ft. T. Y. C.—Duke of Bedford's Magog (E. Edwards), agst Mr. Gregory's Una (Chapple). Even betting. A dead heat.

Match—50*l.* D. I.—Mr. Rogers's Bridegroom (Bartholomew), beat Mr. Pettit's Everilda. Won easy.

Match—200, h. f. D. M.—Lord Albemarle's Ralph, received ft. from Mr. Payne's Johnny.

Thursday.—*The Town Plate* of 50*l.*—Won by Mr. Combe's Rosalind (Rogers); beating Mr. Stephenson's Ma Mie, Mr. Charlton's Lasso, Duke of Rutland's f. by Bizarre, and Mr. Pettit's Everilda. Betting—10 to 6 agst Ma Mie, 10 to 6 agst Rosalind, and 4 to 1 agst Bizarre filly. Ma Mie made all the running, followed by Lasso and Rosalind, the others having little share in the race; at the cords Lasso was shaken off, and Rosalind, passing Ma Mie, won in a canter by a length.

The Rutland Stakes of 30 sovs. each, 20 ft. From the turn of the lands, in. (12 Subs.)—Won by Mr. J. Sadler's f. Testy (Rogers); beating Lord Exeter's f. by Jerry, and Mr. Treen's Bastile. Even on Lord Exeter's filly, and 6 to 4 agst Testy. The trio started abreast, and ran so to the cords, where Testy quitted her companions, and won in a canter by two lengths.

The Queen's Plate of 100 guineas. R.C. Won by Lord Albemarle's c. by Plenipo; beating Mr. Rogers's Bridegroom, and Mr. Osbaldeston's Woldsman. Betting—3 to 1 on Bridegroom, and 7 to 2 agst the Antiope colt. Woldsman cut out the work to the Bunbury mile, where he gave up. The Antiope colt went on with the running, and after a close and distressing struggle with Bridegroom from the hill, won by half a length.

Match, 200, h. ft., A.F.—Duke of Bedford's John o'Gaunt received forfeit from Mr. Osbaldeston's The Devil-among-the-Tailors.

Law.

CENTRAL CRIMINAL COURT.

Post-office Robberies.—Robert Brown, postman, was indicted for stealing a post letter containing money, value 1*l.* 3*s.* 6*d.*, the property of the Postmaster-General. From the evidence it appeared that, suspicions having been entertained of the prisoner's honesty, a trap was laid for him, by putting a marked sovereign, half-crown, and shilling in a letter directed to Mr. Thesiger's clerk, at his chambers in the Temple, which was in the prisoner's district. The letter was delivered, but the money had been previously abstracted; and on searching the prisoner, which was immediately done, the marked coins were found in his possession. Mr. Clarkson objected to the indictment, the money not being the property of the Postmaster-General, nor the letter a regular post letter. The prisoner was found guilty, and sentenced to twelve months' imprisonment, with hard labour; the learned judge observing, that if the case had come strictly within the statute, the sentence would have been transportation.

John Burt, aged 13, was indicted for stealing five post letters, &c., value 49*l.* 11*s.*, the property of the Postmaster-General, he being a servant in the General Post-office. Mr. Clarkson said in this case he had recommended the prisoner to withdraw the plea of not guilty, and plead guilty; the fact being that he had undoubtedly destroyed the letters, but the money had been all recovered, and his tender years should also be taken into account. The prisoner accordingly pleaded guilty. Mr. Justice Cresswell addressed him, and observed that inasmuch as it appeared he had destroyed the letters, not for the purpose of peculation, but merely to screen his negligence in omitting to deliver them, the court did not think fit to pass a very heavy sentence. It was, that he should be placed in solitary confinement to the end of the present session.

Murder on the High Seas.—Philip Partridge, the captain of the Jarrow merchantman, was indicted for the wilful murder of Jose Maria Balagar, a Spaniard, by striking and beating him on the head and other parts of his body, and also by wilfully neglecting to provide him with a sufficient quantity of food and nourishment. It appeared from the evidence of John Fisher, who had been chief mate of the vessel, that she left Liverpool for Benin on the 10th of March, 1841, with a crew consisting of French and English seamen, and one Spaniard—seventeen in number. The ship arrived at Benin at the end of May, discharged the cargo, and got another. She left Benin in October, and was then in a leaky state. Went on to Prince of Wales Island, where she stayed seven or eight days. After she left Prince of Wales Island, Jose, the deceased, worked at the pumps. He was a good seaman. The captain, however, found fault with him, and beat him with a rope. He subsequently struck him with a piece of wood. Some days afterwards the man died, and was thrown overboard. The witness deposed to numerous acts of cruelty and rough treatment which he had himself received at the hands of the prisoner. He admitted, however, in his cross-examination, that no complaint was made against the captain until the captain had complained of the crew. The captain often complained of the steering of the vessel, but the fact was that the vessel was in a waterlogged state, and was very difficult to steer. Witness had sometimes been at the wheel himself for six-and-thirty hours without leaving it. He was the only Englishman who had steered. Another witness, a black, stated that the captain flogged deceased severely. He also flogged witness, and on one occasion struck him down with a piece of wood. The captain gave deceased medicine, wine, and brandy about a week before he died, but he flogged him four days before his death. Peter Gerrard, also a sailor on board the same ship, had seen deceased work at the pumps as well as he was able. He was not a strong man. The captain beat him the very first day he came on board, saying he was not pumping hard enough. Had seen him beat him many times. About six days before he died the captain beat him with a rope, upon which the deceased left the pumps and went forward. The captain then said, "Put him on half allowance; he is not worth his grub." The allowance was half a pound of bread, half a pound of meat, and three quarts of water, for 24 hours. The deceased had half that quantity. Some further evidence having been given, Mr. Clarkson, addressed the jury for the prisoner. He said there was no doubt that the vessel was in the most distressed condition, and there was reasonable ground for supposing that the preservation of the vessel and her valuable cargo, and the lives of the rest of the crew, was only to be attributed to the exertions that were urged by the prisoner from the crew, probably with some considerable violence. The jury could see very clearly that the crew entertained feelings of anger towards the prisoner, and the principal witness, John Fisher, was no doubt very much exasperated at being dismissed from his situation as chief mate, and therefore it appeared that he had strained his evidence all he could against the prisoner, and it was principally upon his evidence that the captain was charged with striking deceased with a piece of wood, and which, as he was instructed, was totally false, and that nothing else but a rope's end was made use of. The prisoner admitted he did use the rope, and he considered that, in the dreadful circumstances in which he was placed, with the prospect of the vessel being lost every moment, and the absolute necessity of desperate exertions being made, he was justified in what he did. The apprentice was then called, and Mr. C. Jones was about to examine him, when he was interrupted by the foreman of the jury, who said they had come to the conclusion that the case for the prosecution had failed to establish the charge against the prisoner. Mr. Justice Wightman said that, after this expression of the opinion of the jury, whose peculiar province it was to consider the effect of the evidence, it would be useless to proceed any farther. The prisoner was then acquitted on this charge.

On the following day he was arraigned under similar circumstances, for the wilful murder of another Spanish sailor called Mariano Maudiolá. The general evidence brought forward was merely a repetition of that adduced at the previous trial, except as regarded that part which applied particularly to the treatment received by deceased. The details of the various acts of cruelty practised by the prisoner were of a revolting kind, and need not be further particularised. The evidence of the chief mate, after recounting these cruelties, stated that when the Captain ordered deceased to be put to the pumps the man was too weak to work; the Captain then ordered him to go up into the rigging, and desired him not to sit down, but to remain standing. There was no occasion for any person to be aloft at that time; there was nothing to do, and it was a very cold night. Witness remained on deck about four hours, and when he went below deceased was still in the rigging. He came on deck again in about an hour, when he found that deceased was still aloft, but that he had changed his position, and was resting with his chin upon the ratlines; his arms were hanging down and his legs were through the rigging, so that he could not fall. Witness observed his face, the features of which were fixed as if in death, his eyes were glazed, and blood was trickling from his nose and mouth. The captain went below soon after he had ordered deceased to go aloft, and did not make his appearance on deck until about eight o'clock on the following morning, when he ordered the crew to fetch him down. He was then carried into the forecastle. In the course of the day witness went there, and found deceased quite cold and stiff. While there, the captain came in and ordered them to rouse him. Witness never saw deceased alive again, and on the following day he saw the body hove overboard. The witness was then submitted to a severe cross-examination, which lasted upwards of two hours. Several other witnesses were called, who spoke to the cruel treatment experienced by deceased on various occasions; but it was also proved that after the captain had gone below, the man was taken down from the shrouds by the crew from feelings of humanity, and severely beaten and sent back by the chief mate, the principal witness. Mr. Clarkson then addressed the jury for the prisoner, and contended against the credibility of the statement of the witness Fisher after what they had just heard in evidence; and the learned judge having summed up at some length, the jury found the prisoner guilty of a common assault. Mr. Adolphus said there was another case against the prisoner, which was not stronger than the other two, and he thought it would be advisable to withdraw the indictment. Mr. Justice Creswell then sentenced the prisoner to be imprisoned for the space of six months, with hard labour.

Forgery.—Isaac Morgan, aged 70, was indicted on the charge of feloniously uttering a forged order for 11*l.* 10*s.*, with intent to defraud Mrs. Martha Foote. The case was established by the evidence, and the Recorder sentenced the prisoner to two years' hard labour, being the lowest sentence the Court was authorised to pass.

Frederick Shackelford, described as an agent, was indicted for misdemeanour, in obtaining goods by false pretences. Donald Cameron deposed that he was in the employ of Mr. J. Milburn, a silk warehouseman in Newgate-street. On the 16th May prisoner called at the warehouse, and wished to know if they served country drapers. Witness said they did. Prisoner then said he was commencing a business at Maidstone, and wished to open an account with the house, and he would pay part in cash and give respectable references for the balance. Witness upon this showed him a variety of goods, and he selected some to the amount of 81*l.* 0*s.* 8*d.* Prisoner then produced a card on which there was printed the name of R. W. Beaumont, carrying on business as a draper at Maidstone, and witness took prisoner into the counting-house, and introduced him as Mr. Beaumont, of Maidstone. Prisoner then wrote some names on the back of the card, and described them as persons to whom he referred for his character. Directions were then given that the goods were to be sent to the Swan-with-Two-Necks, in Lad-lane. On the next day the prisoner came again to the warehouse, and had some dealing with Mr. Milburn, and he understood that a further order for goods was given by him. The goods chosen by the prisoner were sorted out, and an entry made in the ledger, an invoice being at the same time given to the prisoner, who during all the transaction was addressed as Mr. Beaumont, and answered to that name. On two occasions after this prisoner came again to the warehouse, and they had some further transactions of business, and prisoner was treated with as Mr. Beaumont. The Recorder took a technical objection to the form of the indictment, which stated that he obtained the goods from Mr. Milburn, whereas he did so from the shopman. Two indictments therefore fell to the ground, notwithstanding the protests of counsel; but the third was held to be good, and the jury instantly returned a verdict of guilty. The Recorder said he would postpone passing sentence till next session, and that he would give an opportunity (as the prisoner had been convicted on the merits) to his counsel to consider whether he had any valid objection to the form of the indictment; besides, such a course would be more convenient, as he was indicted with several others for a conspiracy, and those parties were not at present in custody.

MARK LANE, Friday, Sept. 30.—Since Monday we have received no fresh arrivals of English Wheat, and its value is consequently unaltered; this morning the Market was rather better attended, particularly by country buyers, and a moderate retail business was transacted at our late quotations. In Barley, Peas, and Beans, there is no alteration. The Oat Trade continues dull, and new Irish must be quoted 6*d.* to 1*s.* lower; fine old qualities maintain their former value.

GAZETTE OF THE WEEK.

INSOLVENT.—S. Simson, Shirley, Southamptonshire, jeweller.

BANKRUPTCY SUPERSEDED.—G. E. Rothe, New Broad-street, merchant.

BANKRUPTCY ANNULLED.—M. Buckley, Oldham, draper.

BANKRUPTS.—R. H. Smyth, Cornhill, merchant—W. H. Ball, Kennington cross, coach master—H. Simmons, Leamington Priors, milliner—J. Badcock, Shrivenham, Berkshire, grocer—H. Payn, Liverpool, master mariner—W. Urquhart, Wellington-street, Strand, merchant—J. Yarrad, jun., Spalding, Lincolnshire, grocer—J. Fisher, and W. Milner, Norwich, drapers—H. T. Harrison, Tavistock-row, Covent-garden, hotel-keeper—F. Sandon, Rugeley, Staffordshire, cabinet-maker—R. Lewin, Northampton, leather seller—A. Blumenthal, Warwick, wine merchant.

SCOTCH SEQUESTRATIONS.—W. Meldrum, Dunfermline, manufacturer—W. Thomson, Kinghorn, Fifeshire, carpenter.

BIRTHS.—On the 23rd inst., the Hon. Mrs. Spring Rice, of a daughter—On the 25th inst., at 35, Curzon-street, Mayfair, the Viscountess Jocelyn, of a daughter—On the 29th inst., in Russell-square, the lady of C. Skipper, Esq., of a daughter—On the 26th inst., in York-terrace, Mrs. Reginald Bray, of a son—On the 25th inst., at All Cannings Rectory, Wilts, the lady of T. P. Methuen, Esq., of a son—On the 26th inst., at 83, Camden-road Villas, Mrs. Collisson, of a son—On the 25th inst., in Pall Mall, Mrs. George Tattersall, of a son—On the 25th inst., in Devonshire place, the lady of H. Burr, Esq., of a son—On the 24th inst., at Brixton-hill, the lady of the Rev. G. Allan, of a son—On the 25th inst., at Camberwell-grove, Mrs. J. N. Scott, of a daughter—On the 26th inst., at Hampstead, Mrs. Sanger, of a son—On the 24th inst., at Greenwich, Mrs. C. Hart, of the Trafalgar Tavern, of a daughter.

MARRIED.—On the 27th inst., at Wargrave, Berks, J. Walter, Esq., of Exeter College, Oxford, eldest son of J. Walter, Esq., of Bear Wood, Berks, M.P., to Emily Frances, eldest daughter of Major Court, Esq., of Castlemans, Berks—At St. George's, Hanover square, J. M. Cooke, Esq., younger son of the late J. Cooke, Esq., of King's Caple, in the county of Hereford, to Mary Elizabeth, only child, and heiress, of the Rev. C. Wetherell, A.M., of Eaton-place, Belgrave-square, and Rector of Byfield, Northampton—On the 28th inst., at Hanover Chapel, Peckham, Frederick, youngest son of W. Reid, Esq., of Peckham-rye, to Mary Ann, fourth daughter of T. Napier, Esq., of Rye-lane—On the 29th inst., at St. James's, Westminster, C. S. Cautherley, Esq., of Abington Pigotts, Cambridgeshire, to Sophia Dorothea, youngest daughter of W. Nicol, Esq., Pall Mall—On the 27th inst., at Alderley, Gloucestershire, T. G. Wills, Esq., of Castlerea, county Roscommon, to Theodosia Elenor, only daughter of R. H. B. Hale, Esq., and the Lady Theodosia Hale, of Alderley, and Cottles House, Wiltshire.

DIED.—On the 25th inst., at his house in Newington, Edinburgh, Sir James Spittal, Knt., who was the first Lord Provost of the city elected under the Reformed Burgh Act—On the 20th inst., at the Rectory-house, Duntsbourn Abbots, Gloucestershire, the Rev. C. Mesman, aged 77—On the 23rd inst., at Brighton, aged 22, Emma, only daughter of W. Smee, Esq., chief accountant of the Bank of England—On the 1st of June, on board the Zenobia, on his passage from Calcutta to England, Ensign R. Harcourt, third son of J. J. Harcourt, Esq., late of the East India House—On the 26th inst., C. R. S. Nixon, eldest son of the Lord Bishop of Tasmania, aged 5 years—On the 21st inst., at his house in Well-street, Hackney, aged 77, Algernon Frampton, Esq., M.D., formerly of 29, New Broad-street, London, and for 40 years one of the physicians of the London Hospital—On the 28th of May last, on board the Zenobia, in the Bay of Bengal, on his passage to England, John, the only son of Sir C. S. Hunter, Bart., aged 43.

TO PLANTERS, NURSERYMEN, GARDENERS, and others.—Fine opportunity for Stocking Nursery, Pleasure, and Ornamental Grounds.—SALE BY AUCTION of Thirty Acres of Messrs. Adamson and Son's celebrated Stock, by Protheroe and Morris, by order of the Trustees, on Monday, the 17th Oct., 1842, and following days, at eleven o'clock, of everything essential to Planters and New Ground workmen, on the premises, Stoke Newington Common; Fruit and Forest-trees, Standard and Dwarf-trained Fruit, Evergreens, American Plants, Deciduous and Ornamental Shrubs, of every variety, in considerable quantities. Such an invaluable opportunity will not be likely soon to recur. The Stock may be viewed a week prior to the Sale, and Catalogues had of the principal Seedsmen, on the premises, and of the Auctioneers, Messrs. Protheroe and Morris, American Nursery, Leytonstone.

MECHI'S ELEGANCIES, for Presents and Use, Manufactured on the premises, 4, Leadenhall-street, near the East India House, London, wholesale, retail, and for export. Ladies' and gentlemen's dressing-cases, in leather, wood, and papier maché, from 100 guineas down to 25*s.*; writing desks, 25 guineas down to 12*s.*; work-boxes, 20 guineas to 10*s.*; ladies' cabinets and jewel cases, assorted; tea caddies, the most elegant in the world, 12*l.* to 6*l.* each, down to 7*s.* 6*d.*; ladies' papier maché work boxes, 10*l.* each; papier maché work boxes, 12*l.* down to 3*l.*; netting boxes, 30*s.* to 23*s.*; card boxes, 5*l.* 5*s.* to 11*s.*; sets of tea trays, 20 guineas to 5*l.*; bottle cases, 30*s.* each; companions, 2*l.* 10*s.* to 10*s.* 6*d.* each: pole screens, 9*l.* the pair; hand screens, 50*s.* to 20*s.* the pair; card racks 40*s.* to 25*s.* per pair; note and cake baskets, 50*s.* to 20*s.* each; bagatelle tables, 13*l.* 10*s.* to 3*l.* 10*s.* each; leather writing cases, containing a complete dressing apparatus, 15*l.* 10*s.* to 5*l.* 10*s.*; pearl and fancy card cases, 3*l.* 10*s.* to 10*s.* each; ivory hair brushes, 4*l.* to 2*l.* 10*s.* per pair; splendid cases of seven-day razors, 10*l.* to 2*l.* 10*s.* the set; ivory handle and other highly-finished strops from 25*s.* to 3*s.* each; Wharncliffe penknives, sporting knives, and fancy scissors, 3*l.* to 5*s.* each; splendid cases of agate, pearl, and ivory dessert knives and table knives, from 42*l.* to 4*l.* 4*s.* the case; a rich variety of slate, bronze, gilt, and papier mâché and table inkstands, from 6*l.* to 7*s.* 6*d.* each. The quality of Mechi's manufactures, the elegance of their display, and the rare combination of excellence and economy, with a very extensive choice of stock, will amply repay the trouble of a visit to his Depot, 4, Leadenhall-street.

SUN-BURNS, FRECKLES, TAN, and other Disfigurements of the Skin, prevalent at this peculiar season, are pleasingly eradicated by that unique preparation, ROWLAND'S KALYDOR, a balmy odoriferous liquid, and now universally admired for its sovereign virtues in completely removing all cutaneous eruptions, and in rendering the complexion delicately clear and fair. It is invaluable as a renovating and refreshing wash during travelling, or exposure to the sun, dust, or harsh winds, and after the heated atmosphere of crowded assemblies. Gentlemen will find it peculiarly grateful after shaving, in allaying the smarting pain.

CAUTION.—Ask for "Rowland's Kalydor," and see that these words are on the envelope, with their signature and address in red: "A. Rowland & Son, 20, Hatton Garden, London;" the same are engraven on the Government Stamp affixed over the cork.

Sold by the Proprietors, and by respectable Chemists & Perfumers.

Printed by Messrs. Bradbury and Evans, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the Office, 3, Charles-street, Covent Garden, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, October 1, 1842.

GARDENERS' GAZETTE	1,415

WILLIAM IVERY, Rye-lane, Peckham, begs to inform his Friends and the Public that he can again supply strong plants of the following Cinerarias: Royal Blue, Rival Ring, Imperial Blue, Grandissima, Queen Victoria, Corminius, Splendida, and Greenii, at 2*s*. 6*d*. each. Also strong Bulbs of Tropæolum Jarratti, 30*s*. per doz., or 3*s*. 6*d*. each; tricolorum, 20*s*. per doz., or 2*s*. 6*d*. each; Achimenes longiflora, 2*s*. 6*d*.

CINERARIA WEBBERIANA.—J. WEBBER begs to intimate that he is now sending out plants of the above much-admired Blue CINERARIA, figured in "Paxton's Magazine of Botany" for July, at 10*s*. 6*d*. per plant, with the usual allowance to the trade. He can also supply Lisianthus Russelianus, at 50*s*. and 75*s*. per 100.—Merriott Nurseries, near Crewkerne, Somersetshire. Sept. 28, 1842.

TWO SPLENDID NEW PURPLE PICOTEES.

WOOD'S LORD HINCHINBROOK, a superb Flower of large size, marking perfect, ground colour of the most snowy whiteness, petals large, and of a beautiful shape, forming a most excellent show flower.

WOOD'S LADY ST. JOHN, a beautiful light-edged Flower, of most superb form and petal, possessing, in short, all the requisites of a first-rate show flower.

J. WOOD, Florist, &c., Huntingdon, begs to announce that the above Picotees, which elicited the admiration of numbers of Florists who saw them in bloom, are now ready for sending out, and can be forwarded by post to any part of the United Kingdom. Price 15*s*. per pair, postage and package included. J. W.'s Catalogue of Carnations, Picotees, &c., for the present season, may be had on application, by inclosing a postage stamp.

N.B.—A remittance or reference expected from unknown correspondents.

FUCHSIA ST. CLARE.

THE above magnificent FUCHSIA was raised by Mr. Meehan, Gardener to Col. Harcourt, at St. Clare, Isle of Wight, from whom Messrs. YOUELL obtained the entire stock. In May last it was submitted to Dr. Lindley for his opinion, which will be found in the *Gardeners' Chronicle* of the 14th of that month as follows:—

"Your Seedling Fuchsia is by far the finest hybrid we have seen; the flower being three inches in length, with the tube and sepals of a bright carmine colour, and the petals of a rosy purple. If, as you say, it is a strong grower and a free bloomer, it will prove a valuable addition to this beautiful genus."

Messrs. Youell, in bringing this beautiful production into public notice, do so without the slightest diffidence, being fully assured of its giving the most entire satisfaction. It is of vigorous habit, fine foliage, and, as a proof of its being a most profuse bloomer, they have a plant in flower at the present time on one branch of which there are upwards of 200 blooms, forming a splendid object for the Greenhouse, Conservatory, or Flower-garden.

Youell & Co. purpose sending it out in the second week of April next, at 10*s*. 6*d*. per plant, free of postage, to any part of the United Kingdom: and all orders they may be favoured with will be executed in rotation.

Orders from the Continent will receive every care in packing, so as to ensure their safety.

The usual discount to the Trade, where not less than 6 plants are ordered.—Great Yarmouth Nursery, Sept. 15, 1842.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WILLIAM WOOD & SON beg leave to inform their numerous Patrons, and Rose Amateurs in general, that their NEW CATALOGUE OF ROSES, for the present season, is now ready for distribution, and will be sent, GRATIS, on application.

The immense Stock of Roses at Maresfield are this season finer and more luxuriant than ever; no pains or expense have been spared to render the collection as rich and unique as possible.

The General Catalogue of Nursery Stock and Trade List of Roses, &c., are also ready for distribution.—Sept. 21st.

CARNATIONS, PICOTEES, AND PINKS.—NATHANIEL NORMAN, Florist, begs to call the attention of the Nobility, Gentry, Amateurs, and his friends generally, to his select Collection, comprising the finest show varieties, with which he has gained twenty prizes this season at the following Societies: London Horticultural, Royal South London, South Essex, and Floricultural Society of London. Has 10,000 Plants now ready, in fine healthy condition.

Catalogues may be had on prepaid application.—Bull Fields, Woolwich.

HYACINTHS, TULIPS, &c.—H. GROOM, Clapham Rise, near London (removed from Walworth), by appointment Florist to her Majesty, respectfully informs the Nobility and Gentry that he has received his Collection of Dutch Roots in excellent condition, and that his Catalogue of Bulbs is ready, and may be had on application.

MYATT'S BRITISH QUEEN STRAWBERRY, after two years' competition, still maintains its pre-eminence; and, in returning thanks to their numerous patrons and friends, J. and W. Myatt beg to say they can with confidence recommend it as the most superb fruit yet known.

Also their new Seedling Strawberry Prince Albert, which for productiveness and size cannot be equalled. Price per 100, each, 50*s*.; and their Eliza, 20*s*. Runners are now ready, and may be had on application to them at Manor Farm, Deptford.

Myatt's famed Victoria Rhubarb, 50*s*. per 100 sets, or 1*s*. 6*d*. per root, will be ready in October.

CARNATIONS AND PICOTEES.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

YOUELL & CO.'s Superb Collection of the above will be found to contain every attainable variety worthy of cultivation; and having spared no expense in rendering their Collection the most extensive and select in the kingdom, they beg to announce that they purpose commencing to execute orders the first week in October, upon the following terms:—

25 pairs	of extra fine first-rate Show flowers,	£5	0	0
12 ,,	do. do. do.	2	10	0
25 ,,	of fine Show flowers,	3	0	0
12 ,,	do. do.	1	10	0
25 ,,	of extra fine Show Pinks,	1	4	0
12 ,,	do. do.	0	12	0

The selection being left to Y. & Co.

They beg further to state that, having a peculiar mode of packing the above plants, so as to insure their safe delivery in any part of the United Kingdom per Post, for the information of parties at a distance, wishing to avoid the expense of Carriage, Package, &c., they will send them free of postage, at the extra charge of 2*s*. per doz. pair.

A Post-office order, or reference, is respectfully requested from unknown correspondents.

Catalogues may be had on application, by enclosing two postage stamps.

NEW SUPERB FUCHSIAS.

Youell & Co. beg respectfully to state, that they continue sending out, per Post (free), their Superb Collection of Fuchsias, at the rate of 21*s*. per doz.

Great Yarmouth Nursery, Sept. 8, 1842.

ROSES.

H. LANE and SON beg to announce that their select annual descriptive CATALOGUE is now ready for delivery, and may be had *post free* on application (enclosing a 2*d*. stamp) at the Nurseries, Great Berkhampsted, Herts; at Mrs. Johnstone's, Covent Garden Market; and Mr. Nutting's, 46, Cheapside, London.

HEARTSEASE.—The following seedlings having been carefully selected by H. LANE and SON from their stock, are now ready for sending out for the first time, and they can strongly recommend them, viz., Sir John Sebright,* 7*s*. 6*d*.; Alpha,* 7*s*. 6*d*.; Christina, 5*s*. 0*d*.; Vulcan, 5*s*. 0*d*.; Venus, 5*s*. 0*d*.; Diana, 5*s*. 0*d*.; Nero, 3*s*. 6*d*.; Acteon, 3*s*. 6*d*.; John Fowler, 3*s*. 6*d*.: Signor Lablache, 3*s*. 6*d*.; and Calypso, 3*s*. 6*d*., if taken singly: but if the whole are taken they will be charged only 45*s*.

Those marked * were awarded prizes at the Floricultural Society of London's Show on the 21st of June last.

PRINCE ALBERT PEA.

CORMACK and OLIVER, SEEDSMEN and NURSERYMEN, New Cross, near the Croydon Railway Station, and Bedford Conservatory, Covent Garden, London, have the honour to offer to the notice of Noblemen, Gentlemen, and others, the above new PEA, as one of the earliest and best sorts extant: in proof thereof, a quantity put into the open ground on the 14th of March last was ready for use the 25th of April following, being only *forty-two days from the period of sowing to the date of gathering for the table*; it is moreover a good bearer, of excellent flavour, and highly advantageous for early forcing. —Packets, containing a quart, 5*s*. each.—September 30, 1842.

TANSLEY NURSERY, NEAR MATLOCK, DERBYSHIRE.

JOSEPH SMITH returns grateful thanks to his numerous friends for past favours, and begs to invite Noblemen, Gentlemen, and others, who may be improving their grounds, to his extensive and well-grown Stock of Forest Trees, Flowering Shrubs, Evergreens, Standard and Dwarf Roses, American Shrubs, &c. &c.

J. S. also begs further to state, that he has on hand upwards of 400,000 Transplanted Larches of various ages and size, stiff growers, and excellent Roots; 300,000 Transplanted Quicks, three, four, and five years old; 40,000 Common and Portugal Laurels; 30,000 Evergreen Privets; with many thousands of fine Rhododendrons for Cover and other Planting; and all other Nursery Stock in proportion.

Catalogues with prices may be had on application.

SOUTHAMPTON NURSERY GROUNDS.—The attention of Noblemen, Gentlemen, Planters, and the Trade, is respectfully directed to the following List of Transplanted and Seedling FOREST TREES, FRUIT TREES, SHRUBS, &c., which are of the finest quality, and will be delivered by Railway or Steam-vessel in London or coastwise, carriage free. The great extent of these Grounds affording a never failing supply of every description of Nursery Stock, purchasers, however varied or extensive their orders, may rely on their being executed with despatch and punctuality. Waste Lands planted in any part of the kingdom, by contract, engaging to replace failures, for 3*l*., 5*l*., 7*l*., 10*l*., and upwards, per acre. Capitalists and Trustees contemplating planting for investment, will find this a safe and desirable means of effecting their object.

Trained Peaches, Nectarines, Apricots, Pears, Plums, Cherries, and Apples, of the most esteemed kinds, as described in the "Fruit Cultivator," by J. Rogers, Southampton, 2*s*. 6*d*., 3*s*. 6*d*., and 5*s*. each.

Currants and Gooseberries, 12*s*. 6*d*. per 100.

Vines, 6*d*., 1*s*., and 2*s*. 6*d*. each.

* That there are in this country two distinct species of the British Oak, is well known to those who have carefully attended to their respective qualities—one being red-wooded, the other white-wooded, and more generally known in the New Forest as the "Durmast," and considered as the most valuable species, producing timber of the largest dimensions. A knowledge of these important facts led W. R., senr., some years since, to ascertain correctly the means of discriminating between the two species, which were found so well defined as to enable him to collect the seed of the desired kind with unerring precision, and likewise to communicate his observations thereon to the Bath and West of England Agricultural Society, who ordered them to be printed in their "Transactions," and their vote of thanks to be recorded for what they were pleased to term most valuable, and, in a national point of view, important information.

Large Trees, for ornament or immediate effect, may be had of every description, from 5 to 10 feet high.

Priced Catalogues forwarded by Post to applicants stating the size and description of stock required.

WM. ROGERS & SON,
Nurserymen, Landscape-Gardeners, and Contracting Planters,
Southampton.

J. SHEPPARD, NURSERY AND SEEDSMAN, WINCHESTER, begs most respectfully to call the attention of the Trade, and the Public generally, to the undermentioned articles, being such that he can fully recommend to give satisfaction:—Sheppard's Duke of Wellington Pelargonium, Sheppard's King David ditto, Sheppard's Isabella ditto, 10*s*. 6*d*. each; Sheppard's Queen of Beauty Pink, a fine Seedling raised in 1841, a first-rate Show Flower, 5*s*. per pair. White's Prince Albert Verbena, a splendid vivid scarlet, superior in colour to anything ever offered, price 2*s*. 6*d*. each plant.—Agents, Messrs. Warner and Co., Seedsmen, 28, Cornhill, London.

J. S. has on hand a fine Collection of Pinks, from 1*s*. per pair.

October 1st, 1842.

BLUE TROPÆOLUM.

MESSRS. VEITCH & SON have to offer a few strong blooming plants of the beautiful new TROPÆOLUM AZUREUM, which was exhibited for the first time at the Horticultural Society's meeting in Regent-street, on Tuesday last, and had the Large Silver Medal awarded to it.—See *Report*.

Exeter, Oct. 6, 1842.

J. PEARSON'S List of Splendid Seedling PANSIES is ready for delivery, and will be sent on receipt of an application containing a postage stamp.

Chilwell Nurseries, near Nottingham.

SPOTTED DIGITALIS.—Seed of the above Splendid Flower, which received a Medal at the June Meeting of the Horticultural Society at Chiswick, can be obtained in small packets at five shillings each—also some fine Pansy-Seed, at 2*s*. 6*d*. do.—from N. Gaines, florist, Surrey-lane, Battersea.—6th Oct., 1842.

JOSEPH CLEGG, FLORIST, Middleton, near Manchester, can supply his Friends with 20 fine choice show Auriculas (collection left to J. C.) for 1*l*.; ditto 12 Polyanthuses, 12*s*.; 20 pair of fine Show Pinks, 10*s*.; 20 ditto Carnations, 20*s*.; 12 ditto Picotees, 12*s*.; also the finest Gooseberries out. Lists can be had on application.

N.B.—Wild's fine Pink Flake Providence will be sold in 21 lots, on the 5th of November, 1842, at 10*s*. 6*d*. Dinner to be on the table at 3 o'clock.

KENSINGTON NURSERY.

RICHARD FORREST and CO., late WILLIAM MALCOLM and CO., by Appointment, Nurserymen, Seedsmen, and Florists to her Majesty, beg respectfully to direct attention to their Collection of BULBOUS ROOTS, just imported. They are remarkably fine this season, and at reasonable prices. Catalogues may be received on application.

R. F. & Co. beg at the same time to state, that their NURSERY STOCK in general was never so fine as this year; and they invite an inspection of the different departments. The American Plants are well set with Bloom Buds.

The Trained Fruit-trees of every description are very fine, as well as all the other sizes of Peaches, Nectarines, Apricots, Plums, Pears, Cherries, &c., and will well repay an inspection of them.

TO HEARTSEASE GROWERS.—J. BUXTON can supply strong Plants of most of the Leading Varieties raised by the most celebrated growers, as well as a few Seedlings of his own that he can strongly recommend. Extra fine Seed, 2*s*. 6*d*. per packet.—Wandsworth Road, Surrey.

MESSRS. DICKSON, NURSERYMEN AND FLORISTS, Acre Lane, Brixton, beg to inform Amateurs and Florists, that their Catalogue of Carnations, Picotees, Auriculas, &c., is now ready, and may be had on application to them, or Messrs. Warner and Warner, Seedsmen, &c., Cornhill, London.

WOOD'S SUPERB SCARLET PHLOX DRUMMONDI.—The colour of this most beautiful of Annuals is a dazzling scarlet; the Flowers are perfectly round, without any space between the petals, forming, unexceptionably, the most brilliant and striking object that can possibly be imagined. J. Wood having grown no other sort, it is impossible that it can be deteriorated by impregnation. Packets, containing 12 seeds, 2*s*. 6*d*. each, postage included.

Nursery, Huntingdon.

N.B.—The above may also be had of Messrs. Warner and Warner, Cornhill, who saw it in bloom.

ALEX. PONTEY begs to call the attention of the Public to the following splendid SEEDLING PELARGONIUMS, which will be sent out this autumn at the prices named under. The COUNTESS OF MORLEY won the GOLD MEDAL at the Royal Devon and Cornwall Horticultural Society's Show at Devonport in 1841, under the name of Beauty's Pride.

The usual allowance to the trade.	£	s.	d.
Wood's Countess of Morley	3	3	0
" Royal Pet	2	2	0
" Eros	1	11	6
" Macbeth	1	11	6

Tropæolum tricolorum and brachyceras, 18*s*. per dozen.

These four are recommended as first-rate and superb show flowers.—Plymouth, August 24, 1842.

TO MARKET-GARDENERS, NURSERYMEN, AND OTHERS.

PROTHEROE and MORRIS are instructed by the Trustees of Messrs. ADAMSON and SON, of Stoke Newington, to submit to public competition, on the premises, Wells-street, Hackney, on Monday, Oct. 3, 1842, at 11 o'clock precisely, the whole of the VALUABLE STOCK, consisting of about 800 Handglasses, 70 Three-light Boxes and Lights, the whole of which are in excellent condition, Horses and Cart, a quantity of fine Rhubarb for forcing, and sundry Utensils. May be viewed two days prior to Sale. Catalogues may be had on the premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

SOMERSTOWN SOUTHSEA NURSERY-GROUND.

TO BE SOLD BY PRIVATE CONTRACT, about 2 Acres of Freehold Land, with a good Stock on it; a good opportunity for a young man that wants to enter the Nursery Business. It is situated in a pleasant spot and a genteel neighbourhood, half a mile from Portsmouth and one and a half miles from Gosport South-Western Railway Terminus. On the ground is a Dwelling House, used as a Seed-Shop, Greenhouse 94 feet long, 2 Bricking Pits, &c.; it will be sold with the Stock, or without, if preferred.—For Particulars apply to Mr. Nobes on the Premises; or to Messrs. Minchin and Oaks, Solicitors, St. George's Square, Portsea.

WESTBURTON, between ARUNDEL and PETWORTH, SUSSEX. PINE PLANTS, Live and Dead Farming Stock, and a Life Interest in 803*l*. 5*s*. 6*d*. Consols.—To be Sold by Auction, by MR. H. SALTER (on the premises), by order of the Assignees of JAMES BISSHOPP, a Bankrupt, on Tuesday and Wednesday, the 18th and 19th Oct., 1842, at 11 o'Clock. The PINES consist of about 4,000 Fruiting and Succession Plants of the very best quality. The PINES produced from this Pinery have always been celebrated for their Growth and Quality, and have obtained the highest prices in the London Markets; and as a further proof of their excellency, they have constantly carried the first Prize at the Shows in London, where they have been brought into Competition with all England. Together with about Three Thousand Flower and Pine Pots.—The FARMING STOCK consists of 5 capital Cart-Horses, a grey Pony, 43 two-tooth Wether Sheep, 8 fat Pigs, and a quantity of excellent Poultry. A four-horse power portable Thrashing Machine, 2 narrow-wheeled Waggons, Dung-Carts, Corn-Cracker, Chaff-Cutter, 2 Ploughs, Drag-Rakes, Cyder-Press, Cloths, and other Effects. THE LIFE INTEREST, of James Bisshopp, aged about 53 years, in the sum of 803*l*. 5*s*. 6*d*. 3 per Cent. Consols, standing in the names of Trustees, and producing an Annual Income of 24*l*. 1*s*. 10*d*., will be offered precisely at Three o'Clock.

Catalogues will be ready 14 days previous to the Sale, and may be obtained on the premises; at Mason's Printing Office, High-street, Steyning; at Mr. Dulley's, fruiterer, Covent Garden; and at the office of the Auctioneer, Arundel. The PINE PLANTS and FARMING STOCK may be viewed the day previous to the Sale, and Particulars of the Life Interest may be obtained on application to Messrs. Ellis and Upton, Solicitors, Petworth.

In addition to the Farming Stock and Pine Plants, will be sold the whole of the Frame Work, Glass, Pits, and Apparatus thereto belonging, consisting of 8 Pine Pits, Hothouse, and several thousand feet of Glass.

The Farming Stock will be sold on the 18th, and the Pinery, with the Life Interest, on the 19th.

TO BE DISPOSED OF BY PRIVATE CONTRACT (the Proprietor going abroad), the Lease, Stock, Greenhouses, &c., of a small Nurseryman, Seedsman, and Florist, in one of the best thoroughfares, and within three miles of the Metropolis. For particulars inquire of Mr. John Forbes, at Hay, Anderson, and Sangster's, Seedsmen, &c., Newington Butts, London. N.B.—The above has been established 14 years. Immediate possession may be had.

TO GENTLEMEN, NURSERYMEN, and others.—LAVENDER-HILL NURSERY, WANDSWORTH-ROAD.—Mr. GEO. HAINES will sell by Auction, by order of Mr. William Pamplin, in consequence of part of his Nursery Ground being required for other purposes, on MONDAY, Oct. 10th, and two following days, at eleven o'clock, the Nursery Stock, which is particularly adapted for persons engaged in planting, comprising large Evergreens, Fruit and Forest Trees, and Flowering Shrubs; Fine-grown Laurustinus, Laurels, Arbutuses, Evergreen Oaks, Phillyreas, Aucubas, Cedars of Lebanon, Hollies, Rhododendrons, Spruce Firs, and other Shrubs; choice Standard and Dwarf Peaches, Nectarines and Apricots, Mulberries, Figs, Vines, Ivy, Box Edging, large Aloe in tub, and a general assortment of young Nursery Stock. May be viewed three days previous to the sale. Catalogues to be had on the premises; at Messrs. Menier and Co.'s, 63, Strand; Messrs. Sheppard's, 99, New Bond-street; at the Office of *The Gardeners' Chronicle*; and at Mr. Haines's Offices, Knightsbridge, and at Pimlico.

ECONOMIC LIFE ASSURANCE SOCIETY, No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON. Established 1823. Empowered by Act of Parliament, 3 William IV.

LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured *to participate in the profits*, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

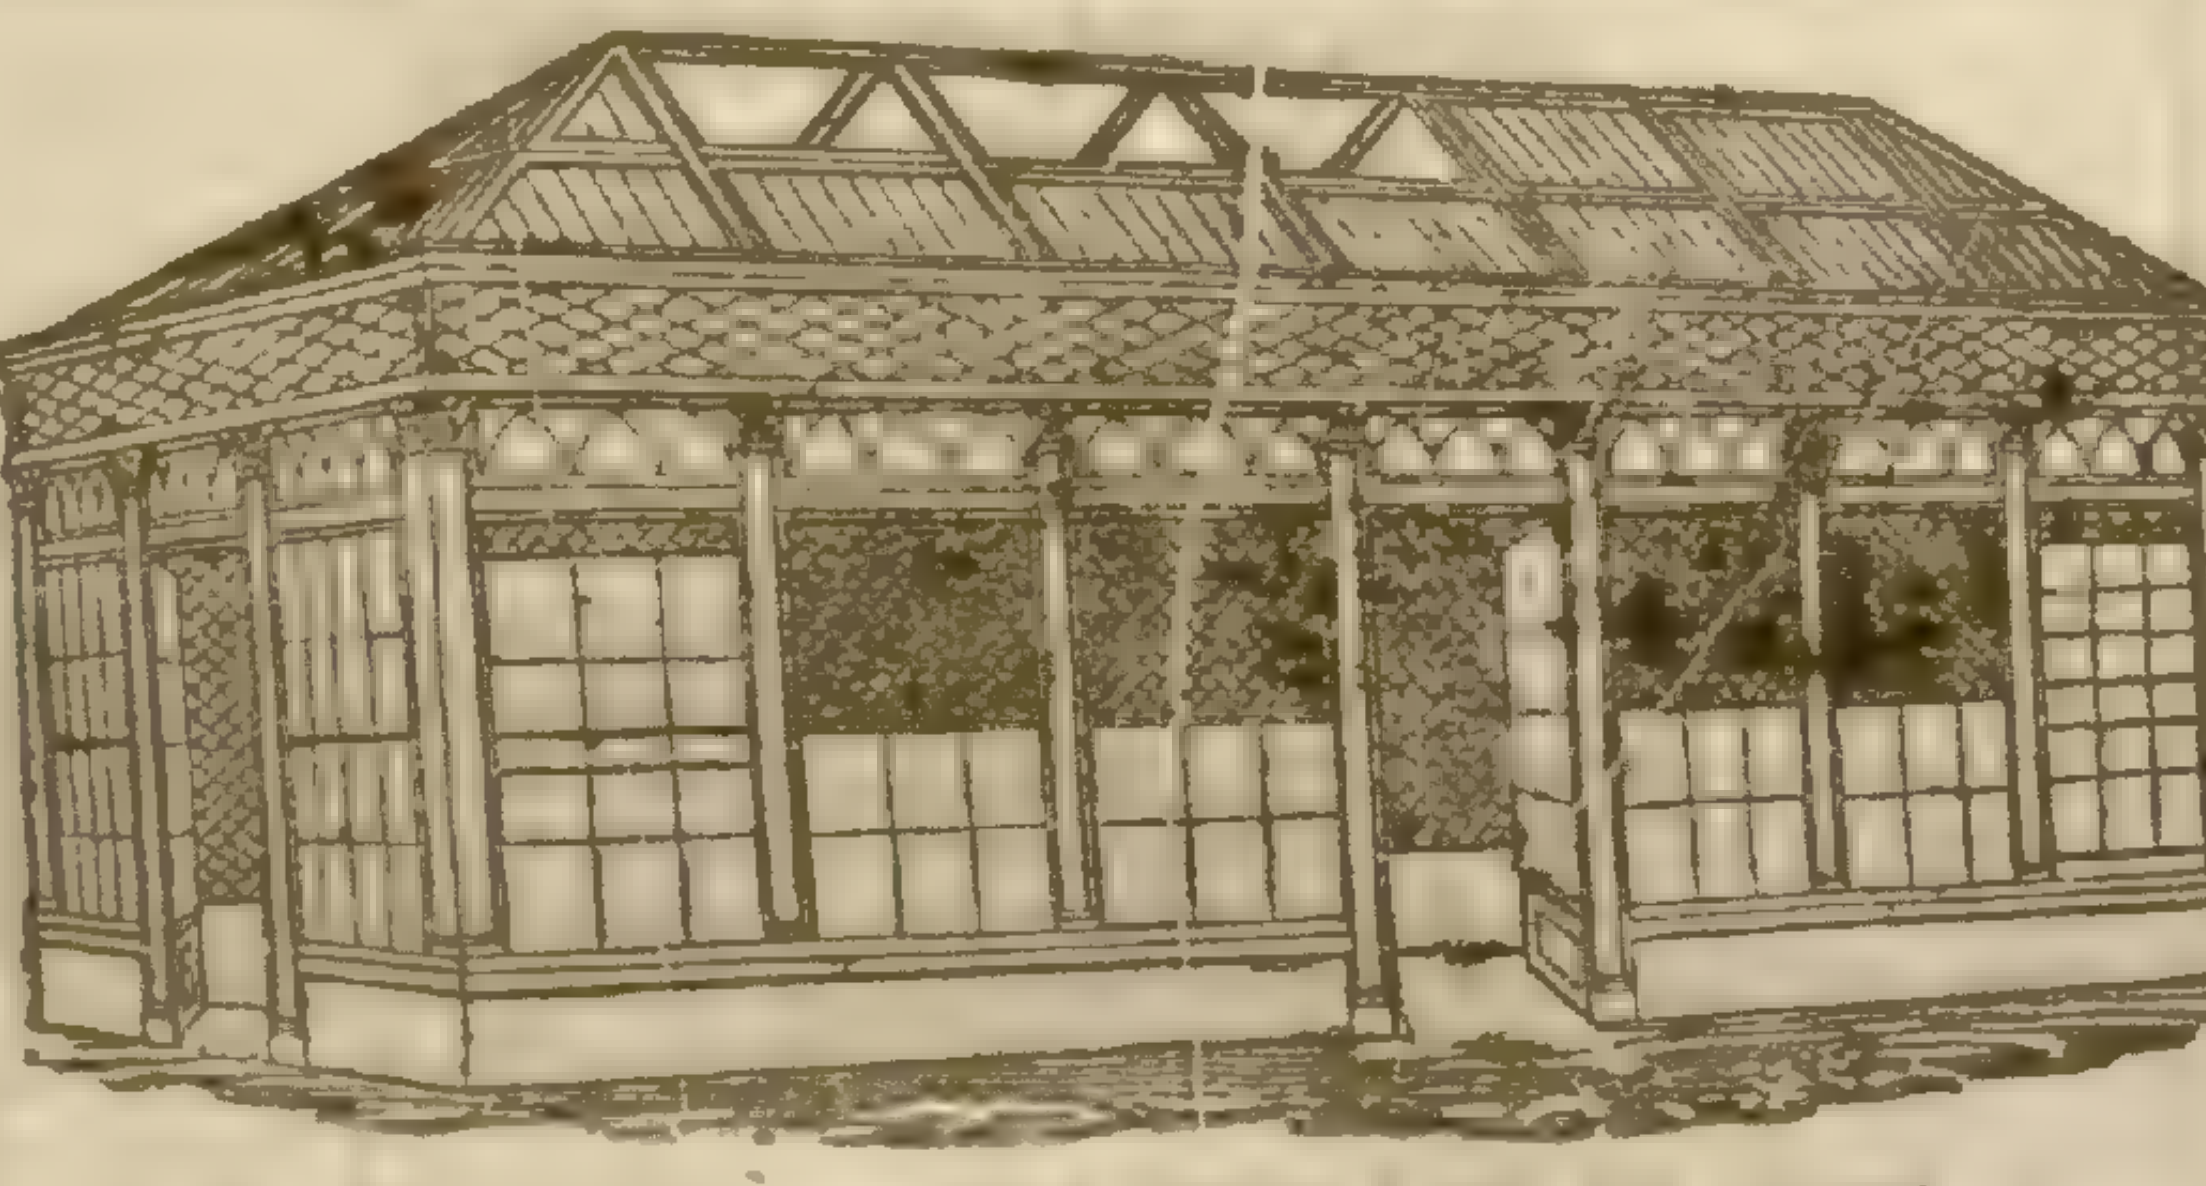
The BONUS declared in 1834 amounted upon an average to 16*l*. per cent. on the premiums then paid; and in 1839 a second BONUS was awarded, amounting on the average to 31*l*. per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam vessel) from any one Port thereof to another during peace, to Assurers, not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice, are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.



HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

J. WEEKS and Co., ARCHITECTS, &c., GLOUCESTER-PLACE, KING'S-ROAD, CHELSEA, Hothouse Builders and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing Houses 300 ft. in length.

Their improved plan of BOTTOM HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's Seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

HEATING BY HOT WATER.

JOHN WALKER, 46, St. John's Square, Clerkenwell, London, having been for many years extensively engaged in Warming Churches, Manufactories, Hospitals, Hothouses, Conservatories, and Private Houses, by means of Hot Water, either in Pipes or Pedestals, can confidently recommend this mode of heating in preference to any other. Numerous references can be given both in town and country, where he has successfully and satisfactorily applied it. Baths fitted up and heated in a superior manner. Orders executed in all parts of the Country with punctuality and despatch.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Frough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their Manufactory.

GARDENER.—WANTED a highly-respectable Married Man, with his Wife, who have no children, to take charge of a Furnished House and Grounds in a village about 50 miles west of London. Himself must be fully competent to the routine of a Kitchen-garden, Wall-trees, &c., as well as Flower-garden with a Greenhouse. His Wife must also be fully competent to the due care of Furniture, &c., and be well qualified and willing to do the usual house duties when the owner may occasionally be at his house. The produce of the Garden for sale, with certain weekly wages, will be the remuneration. It is wished to meet with parties who may themselves have some means and seek a comfortable home. Most unexceptionable reference as to character will be required. Letters, post-paid, addressed J. A., at the *Gardeners' Chronicle* Office, 3, Charles-street, Covent garden, stating present situation, age, &c., of any party applying will be attended to.

WANTS a SITUATION as SHOPMAN, or CLERK to a Nurserymen or Seedsman, a Young Man, who has had considerable experience in the above capacities, having been in one of the first-rate London Nurseries for seven years. Reference can be given as to character and ability. Apply by letter to Y.Z., Messrs. Henderson and Co.'s, Pineapple-place, Edgeware-road, London.

WANTS a SITUATION as GARDENER, a Married Man, without any incumbrance, who perfectly understands his business in Forcing, &c.; can have an undeniable character from his last place, where he lived two years and a half. Address T. S., post-paid, at Mr. Fairbairn's, Clapham, Surrey.

WANTS a SITUATION as GARDENER, or GARDENER and BAILIFF, a Single Man, in the prime of life, who thoroughly understands the business in all the branches of Gardening; he has also a thorough knowledge of Nursery Business, Plantations, &c., with the Management of Stock, &c. Has lived in some of the principal families in England, and can be highly recommended from a family of note that he is about to leave. Address Mr. Brown, Gardener, Lord Southampton's, Whittleburg, Northamptonshire.

WANTS a SITUATION as GARDENER, a Married Man, 34 years of age, with two Children; perfectly understands his business in all its branches; can take charge of Land or Stock if required; or his Wife would manage a Dairy; has an excellent character from the situation he is leaving. Apply to A. B., at Messrs. Paul and Son's, Nurserymen, Cheshunt, Herts.

WANTS a SITUATION as FOREMAN, or to take the charge of the Houses, a steady Young Man, who has a good knowledge of his business in all its various branches; has filled similar situations in first-rate places. Ten pounds will be given to any person who shall procure a situation for the advertiser. Direct, W. B., to be left at the Post-office, Highbury Vale, until called for.

WANTS a SITUATION as GARDENER, a Married Man, aged 29, who well understands his business; he is just from the country, leaving on account of the place being let, where his terms were 1*l*. 1*s*. per week, with cottage and fuel. Character unexceptionable. Address T. D., at Mr. Casement's, No. 3, Flint-street, Walworth.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates.
Price 2*s*. 6*d*.

PAXTON'S MAGAZINE OF BOTANY.

The Number for October, 1842, contains highly-finished drawings of *Sophronitis grandiflora*, *Erica Neillii*, *Pentstemon crassifolius*, and *Echites atropurpurea*; likewise Papers on Gardening as a science; on Planting Shrubs in Beds; and the Preservation of Half-hardy Plants through the Winter. Floricultural Notices of new or beautiful Plants figured in the leading Botanical Periodicals for September; together with a complete Calendar of Monthly Operations for the Garden.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.

2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.

3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.

4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

This day is published, price 5*s*.,

A NEW EDITION OF PROFESSOR JOHNSTON'S ELEMENTS OF AGRICULTURAL CHEMISTRY AND GEOLOGY.

"Clear and comprehensive, we most strongly recommend it to the young cultivator."—*Loudon's Gardener's Magazine.*

By the same Author,

LECTURES ON AGRICULTURAL CHEMISTRY AND GEOLOGY. Part I., price 6*s*. Part II., 4*s*. 6*d*.

Part III. is in course of publication in Monthly Numbers, price 6d. each.

"A valuable and interesting course of Lectures."—*Quarterly Review.*

Wm. Blackwood and Sons, 45, George-street, Edinburgh, and 22, Pall-mall, London.

On the 1st Nov. will be published, Price 1*s*.,

HARRISON'S GARDEN ALMANACK AND FLORAL CALENDAR for 1843. All Advertisements intended for insertion must be sent to the Publishers, 66, Old Bailey, before the 25th inst.

London: H. G. Clarke and Co., 66, Old Bailey, 6 Doors from Ludgate Hill.

THE GOOSEBERRY GROWERS' REGISTER; or an Account of the different Gooseberry Shows held in Lancashire, Cheshire, and other parts of the kingdom, for 1842.

1*s*. 9*d*. in boards, and 1*s*. 6*d*. stitched, which can be sent by post, prepaid, 6*d*. extra, on application at THOMAS D. WATKINSON'S, Seedsman, &c., 6, Market Place, Manchester.

THE GARDENER AND PRACTICAL FLORIST.—In Weekly Numbers, Price 3*d*., and in Monthly Parts, Price 1*s*., containing all that is new and valuable in Gardening and Floriculture. Published by R. Groombridge, Paternoster Row, by whom Advertisements and Communications for the Editor are received.—Sold by all Booksellers and Newsmen.

FOREIGN BOOKS on GARDENING, BOTANY, AND THE COLLATERAL SCIENCES.—A Graduate of one of the Continental Universities, adequately versed in the technical terms of the above departments, is desirous of translating any work or part of it mentioned in the List of Foreign Books inserted in the *Gardeners' Chronicle*. He will also make Résumés of any work, the general contents of which parties may be desirous of becoming acquainted with. Communications addressed to J. L., at the office of the *Gardeners' Chronicle*, will be duly attended to.

The Gardeners' Chronicle.

SATURDAY, OCTOBER 8, 1842.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Tuesday, Oct. 18 . . Floricultural . . . . . . 7½ P. M.
Saturday, Oct. 22 . . Royal Botanic . . . . . 3½ P. M.

COUNTRY SHOWS.—Oct. 12, Guernsey.

AMONG the influences for good or for evil produced on plants by nitrate of soda, there is one that has been very little adverted to. It has been found, in certain cases, to render plants short-jointed. This was, we believe, first remarked by Mr. Fortune, the Superintendent of the Hothouse department in the Garden of the Horticultural Society. Some Pelargoniums under his care, which had been watered with nitrate of soda, became dark green; their branches acquired a reddish colour, and the rate of growth was sensibly checked, although the general health of the plants was improved.

Other experiments in the same garden, by Mr. Gordon, have been tried on Rhododendrons in pots, and with a similar result. When given them at the time when their young shoots were a few inches long, and they were in full vigour of growth, the lengthening was immediately arrested; and by the end of the season each branch had formed a large flower-bud—although there is no reason to suppose this would have happened if the nitrate had been withheld. The quantity supplied, however, although only an ounce to eight gallons of water, was too great for the health of the plants; for all became more or less yellow, and of some, the leaves partially withered and curled up at the end and sides. This is remarkable, because when nitrate of soda has been applied to shrubs in the open border, they have grown more vigorously than ever.

The discrepancy observable in these two instances is probably owing to the different circumstances under which the nitrate acts upon the plants experimented upon. When a plant in a pot is watered, the fluid runs down between the ball of earth and the sides of the pot, where the roots are, and thus is brought into immediate and sudden contact with those organs. On the other hand, when a plant in the open ground is watered, the fluid slowly finds its way through the earth to the roots—it becomes in part changed in its nature before it reaches them; and it is only by the gradual action of capillary attraction through the minute interstices of the soil that it is eventually absorbed by the roots. Much, no doubt, is also wasted; so that, if two plants—the one in a pot, and the other in the open ground—are each watered with a solution of any salt, the first will in fact receive upon its roots suddenly nearly the whole of it; while the other will perhaps not receive a quarter of it, and that not abruptly.

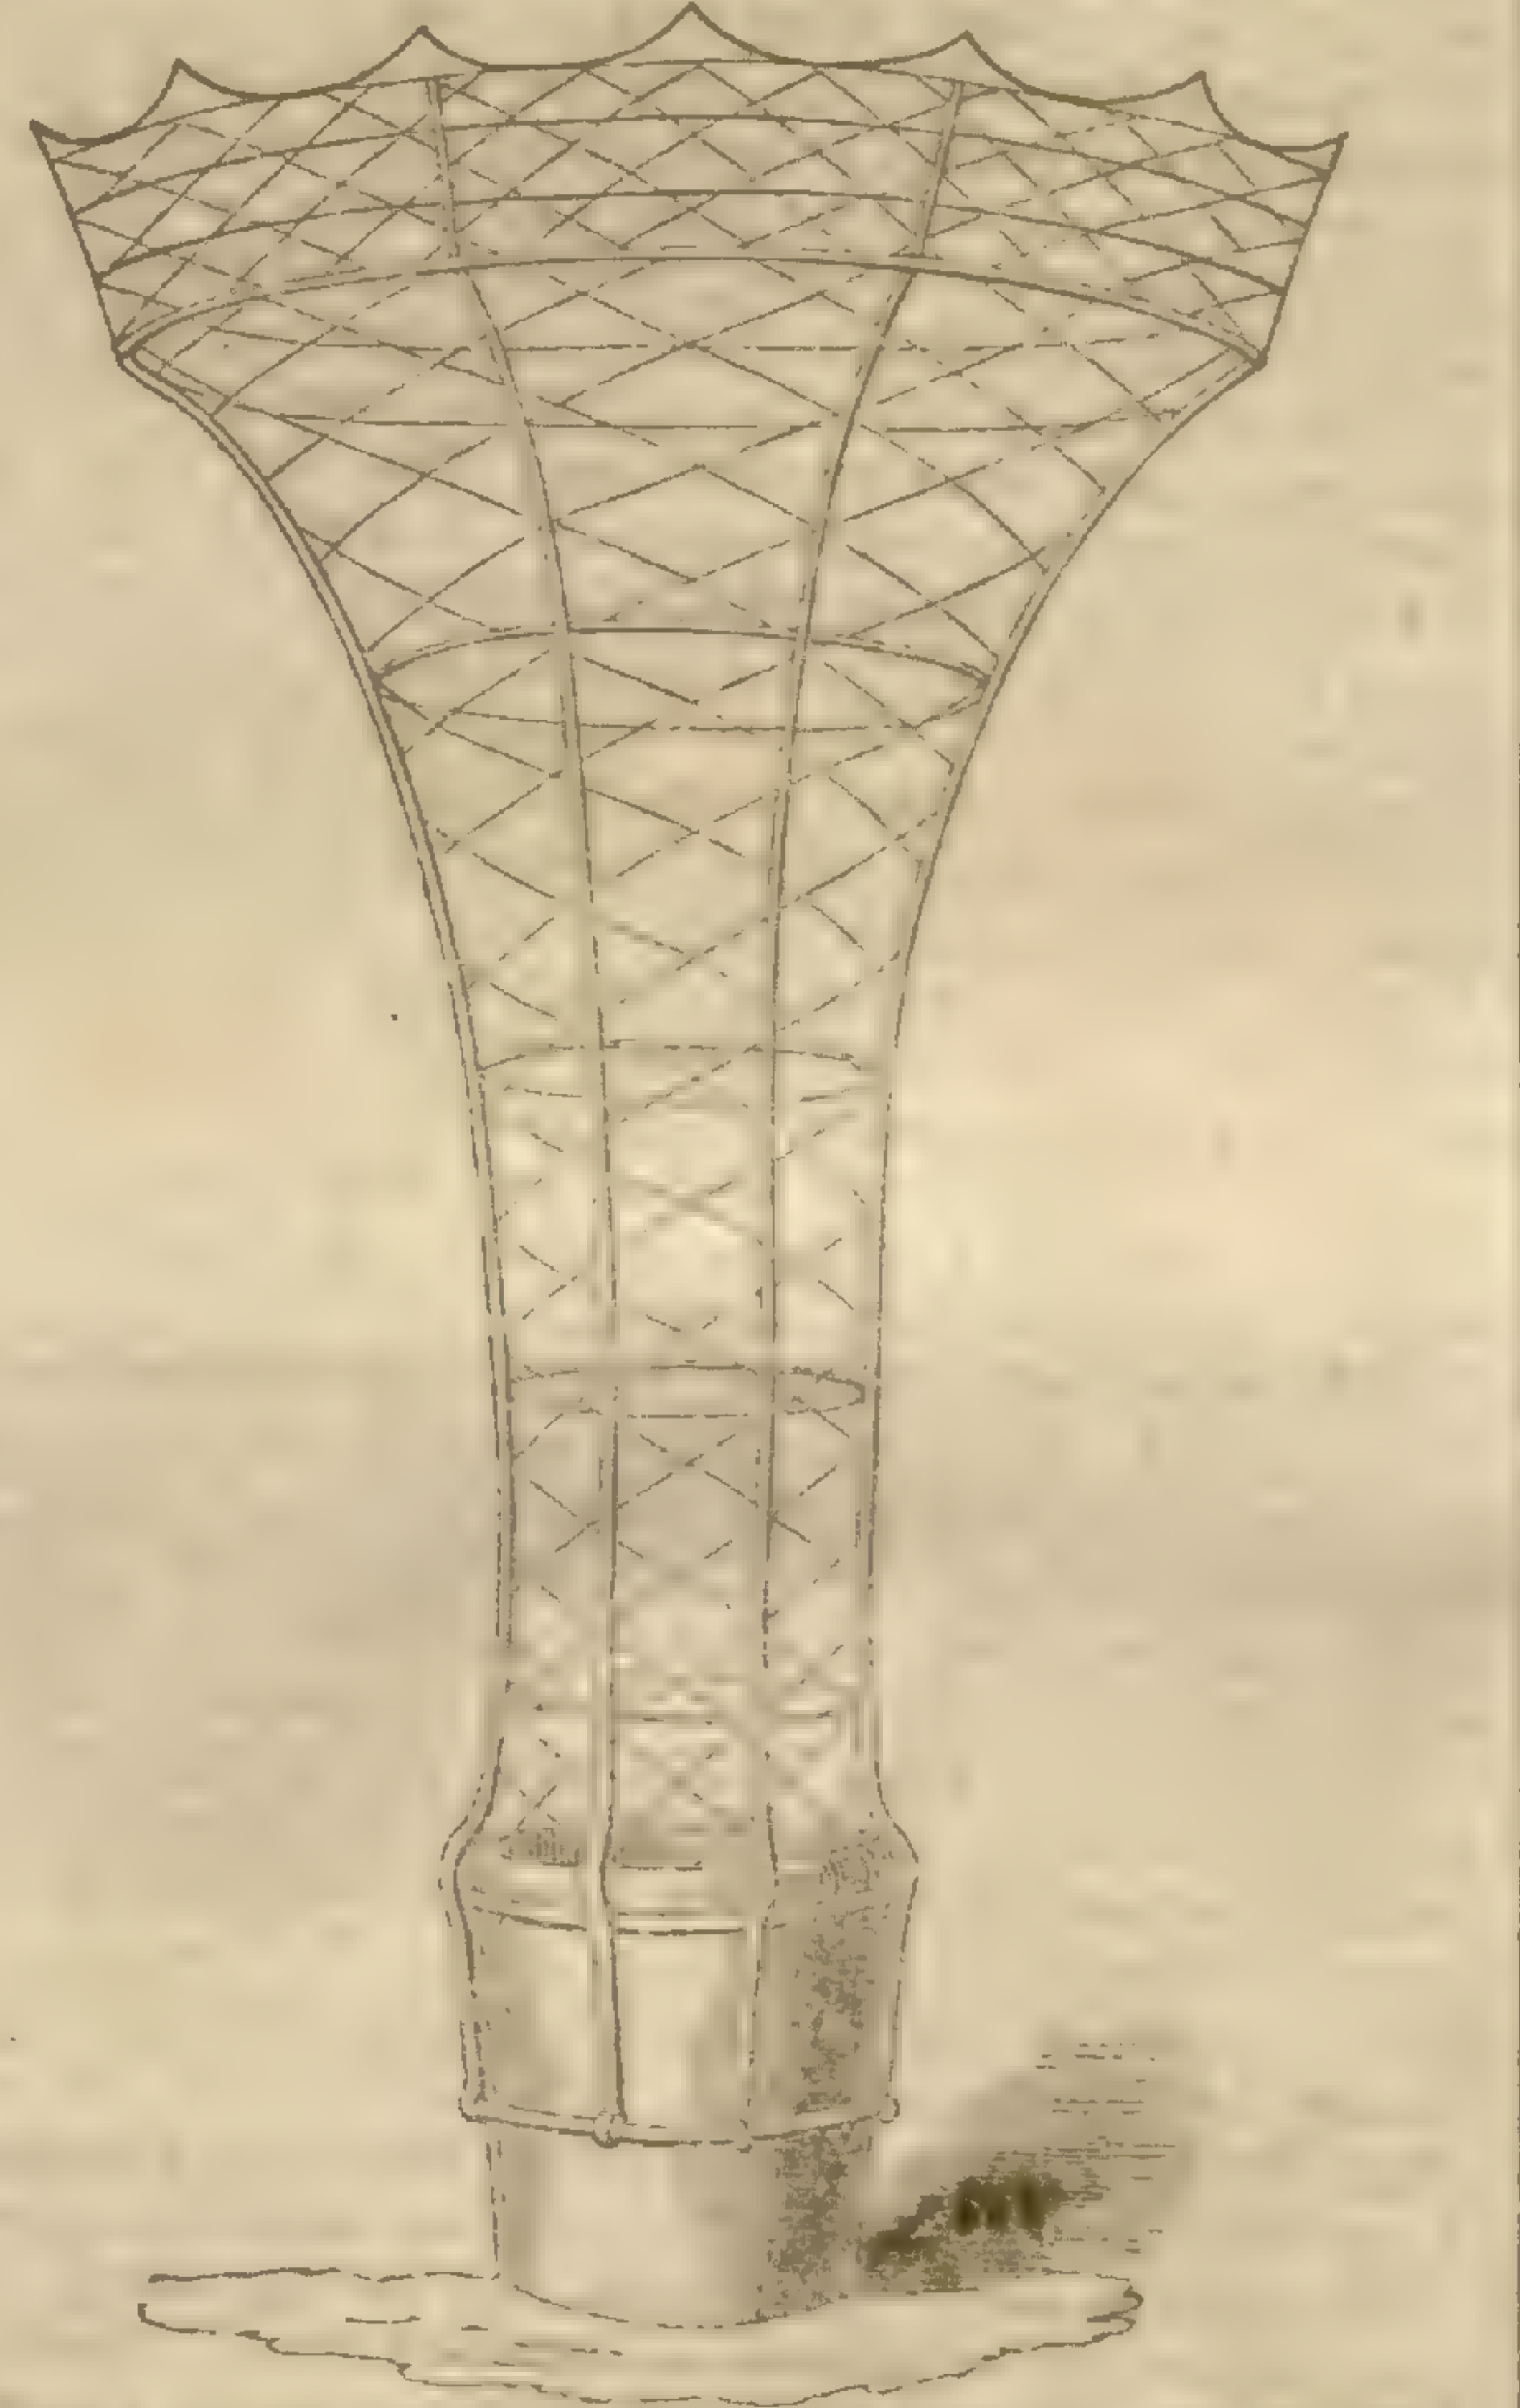
The action of the nitrate of soda upon the leaves of the Rhododendron was indicated externally by insensible changes in the appearance of the leaves. The spaces between the veins gradually became yellow, while the veins themselves remained dark green; so that a curiously netted appearance was produced. Afterwards, the fronts and edges of many leaves by degrees became dry and withered, and curled back; till, in some cases, the younger leaves had lost half their life. In all instances the old leaves of the Rhododendrons exhibited very little sign of the action of the nitrate, whose effects indeed may be said to have been confined to the growing parts.

These facts suggest a new mode of applying nitrate of soda, when it is found impossible to make rare plants flower. We should use it of the strength above mentioned just when the young shoots have burst through the buds, and fully formed their first two or three leaves. But before applying it, we should take care that the ball of the plant was thoroughly moist; for by that means the sudden reception of it by the surface of the roots would be hindered. It must also be recollected by the gardener that newly-potted or planted specimens are not in a fit state to receive this agent. At such a time, their roots are necessarily, to some extent at least, bruised and injured; and when that is the case, the nitrate of soda is generally found to produce an unfavourable effect on plants; as if it destroyed their life by being taken into the interior without undergoing any change.

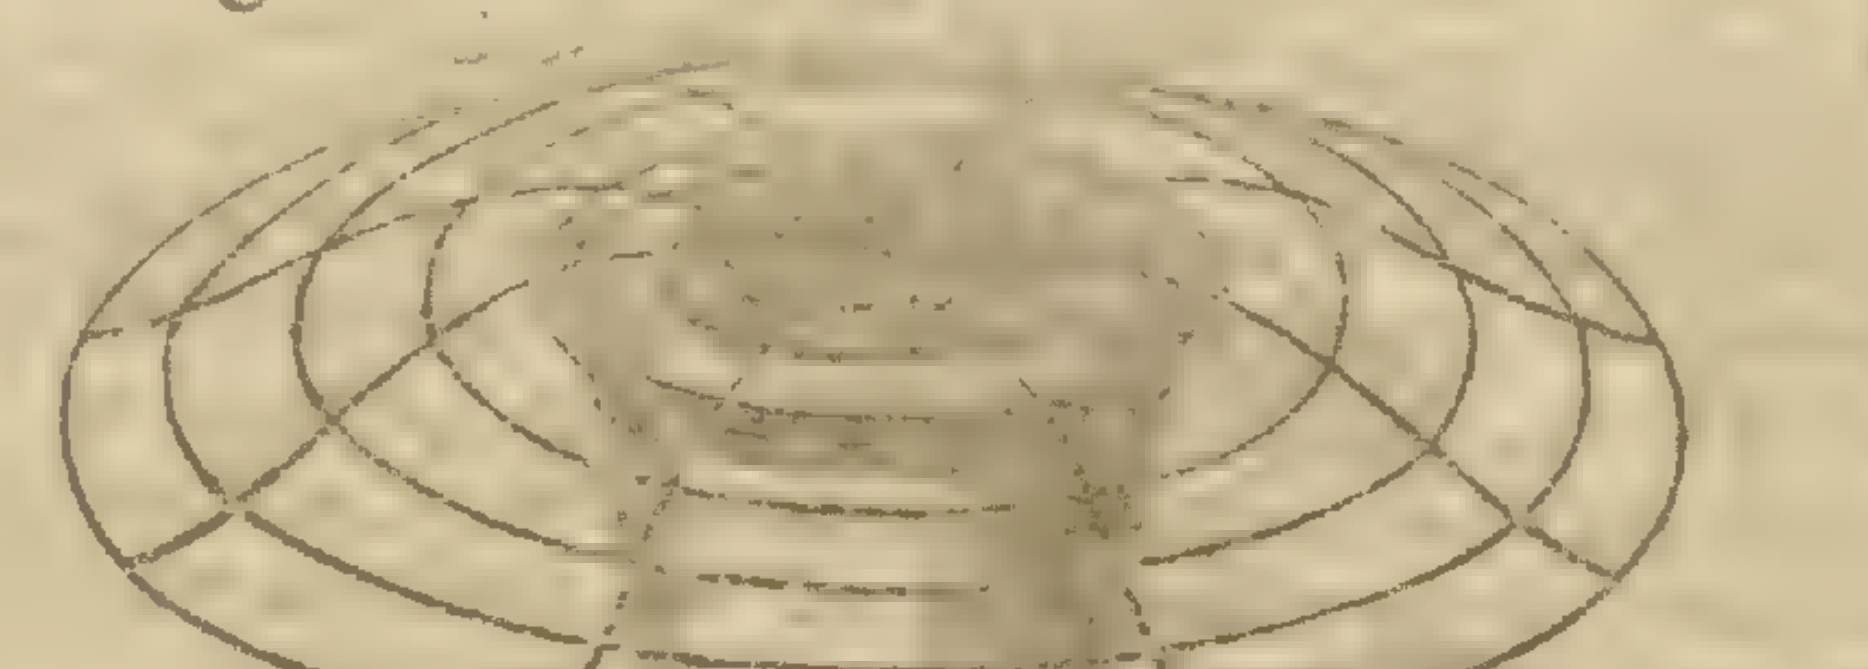
IT is not because some climbing plants require to have their roots confined in garden pots, nor because being, in the majority of cases, inhabitants of tropical forests, they demand more bottom-heat than they can obtain in this country, when planted in the open border of a conservatory, that the modern plan of distributing their branches over the trellis of a flower-pot is to be so much commended. Nor is it because the flowers, which, if the branches are uncontrolled, are carried out of sight by the excessive length of the stems, are thus brought immediately before the eye. There is another great advantage in this practice.

Gardeners need not be told that the immediate effect of compelling branches to grow downwards, is to throw them into flower. Travellers on the Hounslow Road used to look with astonishment at the branches of Pear-trees led downwards, over the walls of Sir Joseph Banks's House; but as those branches were always loaded with fruit, the practice was soon imitated, and gave rise, among other things, to what is called balloon-training. This always produces an abundance of flowers in even the most sterile trees, and of fruit also when the branches are not exposed to severe night-frosts, which kill the blossoms. Just the same consequences follow the training climbing plants downwards; they are compelled to yield a far greater crop of flowers than if permitted to grow at full length.

The many kinds of trellises that have been invented for this purpose are admirably adapted for compelling plants to grow upside-down; for the branches can be bent in all directions over and over again, and the more they are entangled the prettier is the effect produced. Let the following pattern be made the subject of trial with the most obstinate species, such, for instance, as Bugainvillea, and we will engage that in a few months it will be loaded with clusters of its rosy hops.



For smaller trellises, where little trailing plants have to be employed, the following pattern may be very easily brought into use.



ANOTHER subject adverted to in Mr. Edward Solly's report, to which we last week alluded, is the action of muriatic acid on vegetation. There is a very general belief that muriatic acid gas is destructive of vegetable life. Messrs. Turner and Christison, in their well-known experiments, proved, as they thought, that very minute quantities of that agent, even so little as a fifth of an inch diluted with 10,000 parts of air, destroyed the whole vegetation of a plant of considerable size in two days; and they afterwards found, as it is stated, that the extremely minute quantity of one-tenth part of a cubic inch in 20,000 volumes of air had nearly the same effects. De Candolle and others have adopted these statements without question. And actions have been brought by people against the owners of alkali manufactories, the muriatic acid given off in such places being regarded as a nuisance destructive of vegetable life.

A year or two ago, however, a very unexpected result was obtained in the Garden of the Horticultural Society, which tended to raise some doubt as to the accuracy of the above-mentioned statements. Mr. Fortune found that when plants were placed in a confined situation, and exposed to the fumes of weak muriatic acid, so far were they from suffering in consequence, that they grew with augmented vigour; and when half killed by exposure to deleterious influences, they rapidly recovered by being brought in contact with these same vapours which have been pronounced so deadly. It is therefore clear that muriatic acid in the form of vapour is beneficial to plants rather than the contrary, even in quantities much larger than are likely to exist in ordinary circumstances. Upon holding the face over the weak muriatic acid used by Mr. Fortune, the peculiar smell of that substance was distinctly perceptible. So plain, indeed, was the result, and so very clearly marked, that we have since that time considered it worth employing large pans of weak muriatic acid to restore the health of sickly plants in greenhouses; and if we had had unhealthy plants enough to fill a greenhouse, we should certainly have had the experiment tried. The inquiry is well worth the notice of those who possess a good stock of plants fit for an hospital.

Mr. Solly has found that not only is the vapour of muriatic acid inoffensive in moderate quantity, but that no action of an unfavourable kind is produced upon plants even by large quantities applied to the roots. Upon this singular fact we must quote his words.

"Two perfectly similar plants of the Hydrangea were taken and placed under the same general conditions with respect to light, air, &c., and watered with dilute solutions, the one of carbonate of soda, the other of muriatic acid, commencing with very small quantities and gradually increasing the doses. At the beginning of the experiment it was difficult to distinguish the one from the other; they had both the same number of leaves, were nearly of the same size, and alike in colour and general vigour, being both remarkably healthy plants. The solutions taken consisted of one drachm of concentrated muriatic acid, and one drachm of carbonate of soda, each dissolved in fifty drachms of water; of these at first one drachm diluted with two ounces of water was given to each plant daily, but the dose was gradually increased to twelve drachms of each solution, so that in a month the one had received nearly five drachms of concentrated muriatic acid, and the other plant more than half an ounce of carbonate of soda. Under this mode of treatment both plants continued to thrive and flourish, and the blossoms were large and perfect, those formed by the plant treated with muriatic acid being rather the more forward of the two: they were, however, both of the same colour, nearly blue, although it was believed that had they been left untouched, the blossoms would have been pink. It is evident that the acid would have a tendency to render certain matters in the soil more soluble than others, whilst the carbonate of soda would have an opposite effect; the acid would render lime, magnesia, bases, and metallic oxides more soluble, whilst the carbonate of soda would facilitate the solution of silica, acids, and organic substances in the soil.

"During the progress of these experiments, two facts worthy of record were observed: the one was, that some plants are able to absorb a large quantity of muriatic acid; and secondly, that great influence is exerted on the rate of evaporation of the leaves, by the substances absorbed from the soil. I was surprised to find how very large a quantity of this acid the plants were able to take up, and that so far from producing bad effects they flourished under its influence. The greatest quantity which I gave was from one-fifth to one-fourth of a drachm of strong acid to the plant per day—of course dissolved in a larger quantity of water, but still so strong as to be about as sour to the taste as common vinegar."

We cannot but regard this as a highly curious result. It is, however, the more remarkable as being connected with a fact for which there seems no explanation. When plants are fed with muriatic acid, their rate of perspiration is checked. "Thus," says Mr. Solly, "when two Hydrangeas, the one watered with acid, the other with carbonate of soda, were placed under the same circumstances, and watered with three ounces of water each, the one watered with the alkaline solution began to fade, and seemed parched up by heat in the middle of the day; whilst the other remained crisp and fresh-looking. Subsequently it received five ounces of water daily, but even this did not seem sufficient, and seven ounces of water were found necessary to keep it in a condition similar to the other which was watered with three ounces, but under the influence of the muriatic acid. It might at first be supposed that this effect was principally due to the action of the carbonate of soda; but by comparing the plants with others similarly situated, there appeared little doubt that the rate of evaporation was diminished in that under the influence of the acid, and not that it was increased in the one watered with the alkaline solution."

Here, again, we have facts to which too much attention cannot be given. Death in plants during dry weather, and after their being transplanted, is certainly caused by their perspiring faster than the roots can restore the fluids lost in that manner. If, then, muriatic acid, a very cheap material, diminishes the perspiration of plants, for whatever reason, it is well worth inquiring whether the life of plants, suffering from excessive perspiration, may not be preserved by adding muriatic acid to the soil they are growing in. We recommend this to the attention of our experimental friends, because, although the application of muriatic acid may be impracticable upon a large scale, there may be a thousand cases in gardens in which there would be no difficulty about it.

There is still another point in Mr. Solly's report upon which we shall have some observations to make, but we must defer them till next week.

THE ACACIA, OR LOCUST-TREE.

HAVING observed the remarks in your review of Mr. Withers' Book on the Acacia, in No. 30 of the *Chronicle*, where you state that you have looked in vain for any satisfactory reason for the scarcity of this tree, notwithstanding all that has been said in its favour, and the great quantities which have been planted, with your permission I will endeavour to assign the main cause of its scarcity. The chief objections to its general culture, as you have observed, are its brittleness while young, and the injury which it sustains in an early state from game, but what game you did not specify; hares and rabbits will attack it, so also will horses and deer when they can get at it. These two causes you think will always continue to operate against its more general cultivation, in which opinion I agree with you, except they can be overcome, as no doubt they will be ere long. Another cause may be added; although a quick-growing tree while young, yet after a time it loses that property, except in favourable localities, and seldom attains to a great size; nevertheless it soon becomes sufficiently large to be of considerable value and profit for many uses. There are several other trees of amazingly quick growth while young, which soon lose that quality: for instance—the common Elder and the Hagberry of the North of England or common Bird Cherry, the latter having been known to make shoots near 7 feet long in one season. I wonder this is not more cultivated, as it makes an excellent coppice wood, and, I believe, good timber; besides its great beauty and fragrance, with the fruit which it affords for game; it delights in a moist soil.

But to return to the brittleness of the Locust-tree—which can be easily overcome by adopting my system of training it—this is, when it has formed lateral or side shoots a foot or two in length, to pinch off the extreme ends of the strongest of them; this will cause them to produce more laterals of a weaker growth and prevent them from becoming too luxuriant and acquiring too great a weight. One main leader should be retained and encouraged for the stem of the future tree; all other strong laterals as they are successively produced must be treated every growing season in the manner above described, and left on till the stem has acquired sufficient strength and arrived to the desired length, when a few of them may be thinned out, but not in regular tiers, as is the practice of some persons. The tree may then be left to its natural habit, except in some particular instances, where it may grow too luxuriantly, or where it is exposed to strong winds; in such cases, after a few years' growth, the extreme ends of the strongest branches which are to form the head should have their ends shortened; this will prevent the wind from having that power over them which it has over a long straggling branch, particularly when the leaves are loaded with wet. If this practice was adopted and followed up, I have not the least doubt but the first objection (its brittleness) would be overcome. It should be remembered, however, that the Locust-tree is not the only one subject to such disasters. Ten years ago I laid out and planted for John Griffith, Esq., Shooter's Hill, near Wem, Salop, two groups of the Acacia in an open field, to produce immediate effect. These trees were at least from 12 to 15 feet high, and without any kind of shelter near them, but exposed to the strong north-west winds from the Welsh hills. The soil was good, being a strong reddish marl, with a wet bottom, but drained. Now, after 10 years, not a tree has been blown down, and scarcely a branch has been broken, although lying so exposed. They now form two beautiful groups of healthy-growing Locust-trees, which may be seen from the turnpike-road which passes in front. I believe the best mode of planting the Acacia would be in masses in the interior of a plantation. I am sorry to see such observations as those of Mr. Godsall in No. 37, and even your own in No. 30, because such opinions, without a fair trial, tend to bring a valuable object into disrepute. I have been training a few trees of this description for several years without having had any disasters from their brittleness.

With regard to the other main cause, namely, injury from hares and rabbits, if gentlemen prefer raising or preserving colonies of them as emoluments to their gamekeepers (for as long as they are allowed to sell or give the rabbits away, depend upon it they will never be kept under effectually, besides the destruction they occasion amongst young forest-trees and grain), to having thriving, healthy, and profitable plantations of timber, who can prevent them? As I well remember a saying of the late Lord Kenyon in his charge to a jury, "if a man would run his head against a wall, who could prevent him?" However, to mitigate in some measure so sore an evil, as regards the Locust-tree, and some others which suffer from the barking and biting off of young shoots and stems by hares and rabbits, I will endeavour to point out an effectual remedy, if properly applied and followed up until all danger is passed. I have seen many methods recommended for the above purpose in the *Chronicle* and "Gardener's Magazine," chiefly for young Apple-trees, all of which methods are either troublesome, unsightly, and even injurious, such as coal-tar, oils, lime-wash, hay-bands, &c.; but what I have used for years with unfailing success, is a mixture of liquid night-soil and soot, and if necessary to bring it to the thickness of yeast, some strong soap-suds, which will increase its adhesiveness, and bring it to a proper consistence. It can be applied around the lower parts of the stem by means of a wisp of straw with the ears remaining, tied upon a small handle, or with a painter's brush; or, if the stems are large, a small besom of fine heath would be more expeditious. Sometimes I repeat the dressing a second time after the first is dry, if I think it too thin, or just before the frost and snow commences. This mixture will wear or wash off towards spring, and is nearly invisible at a small distance; whereas coal-tar, lime, &c., are always an eyesore. I think it would prevent deer, if properly prepared and timely applied in sufficient thickness; but against horses it should be laid on higher up the stems—it is in spring and summer, I believe, that they do the mischief.

Whenever the bark of Locust-trees has been materially injured, it checks their growth for years, whereby they become stunted and bushy-headed; and from which they never recover, unless the head is pruned, and once more trained to a leading shoot. It has been said that the Locust-tree will not succeed in this country, but only in the warmer part of America. Why should it not? The temperature of the climate suits it well enough. The true cause I suspect is the same with the Locust-tree as with the Indian Corn. I have lately been informed by a person, who resided some time in that part of America where the Locust abounds, that the summer and autumn months are not subject to such windy and wet weather as we generally have, which, when the Indian or Cobbett's Corn is in flower, breaks the spikes of the male flowers, thus dispersing and spoiling the farina; consequently the grains on the female spike are never thoroughly fertilised, and can never swell to maturity. This fact I am convinced of from my own experience. From the absence of these causes in America when the Corn is in blossom, and when the Locust-tree is in a growing state, we hear of no such failures there. The ill success and slow growth of the Locust-tree, mentioned in Mr. Withers' book, have no doubt been occasioned by the bark having been injured when young by hares or rabbits, or from want of training. Without some precaution being used against hares, rabbits, &c., either by destroying them, or by effectually inclosing the plants while young, it will be only time, money, and labour, thrown away; and, what is still worse, disappointment will continue to retard its general cultivation, and bring it into disrepute.

Allow me now to make a few remarks concerning Mr. Withers and his book. Much valuable information can be gleaned from it by the skilful; and again there are some things which should be rejected; but they do not in the least derogate from the merit and zeal which he has shown in laying before the public such a mass of valuable matter. Yet I think as you do, if the causes of its failure hitherto, with the remedies for them, are not pointed out and obviated, the Acacia will make but little progress, however valuable it may be. It possesses one good quality: it will succeed on barren soil of a sandy nature, provided it is dry. Whoever may be the compiler, I will not say author, of the "Essay on Planting," I am convinced he does not write from experience, as his work is full of confusion, doubts, and incongruities. For instance, saying "the Larch is a coppice wood;" that "the Pine tribe would not admit of pruning, but in some few particular cases, and with great judgment;" but he does not tell us how, or in what cases. Then, "Colonel such a one pruned Larches with great success;" and, to crown all, he informs us "that the Swedes and Norwegians prune their Pines freely." Hence, he says, "the superiority of their timber, in being sound and free from knots." Again, in speaking of Mr. Cree's method of pruning forest-trees, he says, "whether the effects are real or imaginary:" his doubts of it show clearly that he does not understand the true cause of the increase of timber in trees; and his directions for curing the canker in timber-trees are a convincing proof that he is only a compiler of other people's opinions, and no master-hand, as some reviewers would have us believe.

The Essay on Pruning is, upon the whole, very correct; but I differ from it on some points—such as cutting off young trees close to the ground, except in rare cases, and in pruning off the lateral branches at an early stage, removing always the lowermost in regular successive tiers. With respect to Mr. Swift's opinions, and the Duke of Portland's annotations on the Essay on Pruning, it shows that neither the woodman nor his Grace understood the true cause of the increase of timber in trees, or the Duke would never have hazarded such an assertion, that "the branches of a tree will do it no good." The very proofs which are adduced in favour of that conclusion prove the very reverse. Three trees planted with their side-branches untouched, and three others divested of their side-branches, grew so nearly alike, that no perceptible difference could be perceived. But it is admitted that the three trees, divested of their side-branches when planted, had made fresh branches. Now I think it evident that those fresh branches were the cause why those trees had made equal progress with the other three. Had the shoots been rubbed off as they were produced, or had the trees not made any, a great difference would have been seen, and an opposite conclusion arrived at. We are informed that the three trees with the side-branches left on at planting, inclosed with cross-bars of wood, added as they advanced in height, outgrew the others considerably. This shows the advantage of warmth and shelter, notwithstanding what has been lately asserted to the contrary.

What are we to expect from such a chaos of opinions, and from such high authority? One says the branches will do the tree no good; another, that hardy trees do not require warmth or shelter; and another, that the branches are complete bloodsuckers—that they draw the sap from the stem; while others again state, that timber is increased only by consolidated sap, the true cambium, &c. &c., in concentric layers. From such confused statements, what can be expected but doubts and irresolution how we should proceed? Hence, the low degraded state of the science of arboriculture in this country; and every fresh publication that I see on the subject convinces me more forcibly that it will make but very slow progress until there is an arboricultural society established, or experimental plantations formed, to explain and teach the true principles by example.—*W. Billington, Underhill, Oswestry, Salop.*

ON ANIMAL MANURES.—No. III.

(By PROFESSOR CHARLES SPRENGEL. Translated from the German.)

(Continued from page 652.)

THE bones of different species of animals differ much as to their component parts, and therefore are not of the same value. As far as nitrogen is concerned, the bones of cattle are the best, whilst those of horses and sheep are preferable on account of the greater amount of phosphate. Those who use bones as manure should bear that in mind. The bones of cattle have been accurately analysed by Berzelius, and 100,000 parts contain—

55,450 parts of	phosphate of lime.
2,950 . . .	phosphate of magnesia.
3,450 . . .	soda and common salt.
3,850 . . .	carbonate of lime.
1,000 . . .	fluate of potash.
33,000 . . .	cartilage with a little water—(30 per cent. ?)*
100,000	

With the phosphate and carbonate of lime however, some soda, common salt, and magnesia might have been mixed.

Bones of horse consist in 100,000 parts of—

67,000 parts of	phosphate of lime.
3,000 . .	soda and common salt.
30,000 . .	cartilage, with a little water.
100,000	

Calf-bones contain 54 per cent. phosphate of lime, and 42 per cent. cartilage; bones of swine, 52 per cent. phosphate of lime, and 44 per cent. cartilage.

As far as the use of bones for manure is concerned, it is requisite that they should be previously reduced into the finest possible dust, which, however, is a difficult operation, on account of the toughness of their cartilage. The operation is performed by pounding or grinding, sifting the dust, and pounding and grinding the coarse pieces again. Fine pulverisation is absolutely necessary, in order that the cartilage may be the sooner dissolved in water, and the phosphate of lime in the acids of the soil. The coarser the dust, the more it will take to manure a certain area; the finer, the less: however, the coarser powder will act during a longer period. Of fine bone-dust, 700lbs. to 800lbs. will suffice for the Magdeburg acre; of coarse, 1,200lbs. to 1,500lbs., especially if an immediate effect is expected. Heavy clayey soils will require more than light loam or sandy fields; and if bones are to be used efficiently upon dry sandy soil poor in humus, the bone-dust must be first mixed with humous earth, and be left to rot, as we shall state hereafter. Bone-dust always acts best if brought into close contact with the roots, and should therefore either be harrowed in with the seed, or used as a top-dressing. In England, it is drilled in the ridges, where turnips are sown. 700lbs. per acre will act even after three years, as I have found by several experiments; the first year, however, the action will be the greatest if the season has not been too dry. It has been assumed, that 200 lbs. of bone-dust are equivalent in their action to 500 lbs. of dry manure, which, however, is a very uncertain calculation, for the quality of the manure must be taken into account.

If bone-dust is to act properly, it is necessary that the soil should not be deficient in humus and moisture; because both cartilage and phosphate of lime are substances with difficulty dissolved in water; the latter especially being only soluble in water by the acid of the humic or carbonic acids derived from humus. Moisture is also indispensable, because it is necessary to bring about the change of cartilage into ammonia and carbonic acid. Humic acid is of equal importance, for the sake of neutralising the ammonia generated from the cartilage and fixing it. If then manuring with bone-dust has been occasionally found to be unsuccessful, it may have been caused by the deficiency of humus or moisture. To be certain, then, that bone-dust will produce the desired effect in a dry soil devoid of humus, it is always best to mix it with

---

* The dry cartilage is said to contain:—

16,09	nitrogen.
48,28	carbon.
8,04	hydrogen.
27,59	oxygen.
10,000	

It yields, however, on being burnt, a small quantity of ashes, which consist of phosphoric acid, lime, sulphuric acid, chlorine, and soda; chlorine, sodium, phosphorus, sulphur, and calcium are consequently amongst its component parts.

humous earth and to throw them into a hole. This mixture being kept wet will become rotten, much humate of ammonia will be formed, and it may then be used as a top-dressing, or be harrowed in with the seed. Bone-dust will become equally efficient if previously put into a urine-tank and permitted to decay. The phosphate of lime will thus be decomposed by the carbonate of ammonia that arises from urine, the result of which will be the generation of phosphate of ammonia and carbonate of lime. The former salt is very soluble in water, and will therefore—even if there be but little humic acid in the soil—easily provide plants with the necessary amount of phosphorus, as well as nitrogen. Experiments which I have made with the phosphate of ammonia have shown that it is very beneficial to plants.

It has been also recommended, when bones have been merely crushed, to mix them with quicklime in a ditch, and to let them rot there; but this process is bad. The consequence of it is, that the whole of the ammonia developed from the cartilage will escape as gas. Equally objectionable is the plan of packing bone-dust in heaps before using it, wetting it, and letting it rot in that state; because, in this instance also, the ammonia will assume the form of gas. If, on the contrary, as shown above, humous earth is mixed with the bone-dust, all the ammonia will be fixed by humic acid. If the bones contain much fat, a sort of ammoniacal soap, easily soluble in water, will be produced.

Those vegetables will be most advanced by manuring with bone-dust in which much nitrogen, phosphorus, and chlorine are to be met with, to which class belong all sorts of Cabbages and Turnips, Wheat, Trefoil, Beans, Peas, and Vetches. Used on meadows, bone-dust brings up different species of Trefoil and Vetches, and at the same time generates a rich herbage, much relished by cattle.

It has been objected to bone manure, that it brings to the land worms and insects which destroy the crops; but this will not be the case if the bone-dust has been previously mixed with humous earth, and is thoroughly rotted; because, in that case, the cartilage, which attracts the worms and insects is decomposed. To lighten a clayey soil by coarsely-crushed bones, as some have suggested, is, at the high price of bones, quite out of the question on account of the expense.

(To be continued.)

MEASURES OF CAPACITY.

I HAVE been a long while ruminating on this subject, but it only occurred to me about three years ago to try whether a cube of four inches might fitly represent a quart. It was a lucky hit; so much so, that it is very slightly different from the Winchester measure, and its multiples and subdivisions are quite free from fractions of cubic inches: the smallest alteration would completely defeat the purpose. On the adoption of this plan, the scientific and elaborate definition of the standard measure, and all its costly copies and accompaniments, might be set aside as useless, or resolve itself into the dimensions derived from the standard of extension alone; when an eight inches rule, a four inches cube for testing a quart, and an eight inches cube for testing a peck-measure, formed of wooden boxes, would be all the articles wanted for dealing with dry and liquid goods: a measure might be added of 16 inches square and 8 inches deep, as a bushel of 8 gallons.

Having got exact cubic measures, it is easy enough to alter old cylindrical measures to the same capacities: a cylindrical quart would be 4 inches deep by 4½ inches diameter, a peck 8 inches deep by 9 inches diameter, and a bushel 8 inches deep by 18 inches diameter, or thereabouts. It is a trifle less than the Winchester, but will contain about the same weight of wheat as is usually assigned to the bushel.

I found that a bushel of fine wheat, of the growth of 1836, weighed 60lbs. to the bushel of 2048 cubic inches in April 1838. The late Mr. Cobbett, in his "Cottage Economy," paragraph 79, estimates a Winchester bushel of wheat at 60lbs.; and on 9th December, 1841, Doctor Daubeny, Professor of Rural Economy in the University of Oxford, in his lecture before the Royal Agricultural Society of England, reckons 30 bushels of wheat to weigh 1,800lbs., which is 60lbs. to the bushel. The Professor of course means the imperial bushel, and Mr. Cobbett the Winchester bushel, and they affix the weight of 60lbs. to each respectively; but the imperial bushel is equal to 33 quarts of the Winchester, and therefore larger in the proportion of 33 to 32.

This alteration of the measure was little thought of at the time it took place; but as far as a farmer grows grain, and admitting that his gross return should be equal to three rents, this alteration in the measure, as far as it was unnoticed, operated as a tax on the farmer of about 10 per cent. on his rent; and the consumer was partly benefited by what the farmer lost, if it were not known that he was receiving a quart more than usual in every bushel of grain.

But the imperial standard has not been universally adopted, and may not have been very injurious to any class of persons, it having operated rather as an increase to the still-existing variety of measures, instead of establishing their uniformity, which is still so much to be desired. In many parts of the kingdom the local measures are retained, but modified sometimes by weight.

In the complication of measures of capacity, a confusion is generated, which is advantageously turned to account by skilful and wholesale dealers, while the less-informed and poorer classes suffer, without any easy means of redress; and it appears evident to my apprehension, that the adoption of a simple measure, verified by an ordinary rule of extension, would be very advantageous to the public, and particularly to the poorer classes.

The propriety of inquiring into the merits of this suggestion, the simple plan of taking a cube of 4 inches as a quart measure, appears to me so obvious, that I have already said too much on the subject; but the Legislature has been occupied in the alterations already made, to such a degree, that a great aversion exists against entertaining any further innovation.

Having endeavoured to state what I conceive to be favourable to the plan above mentioned, I shall conclude with a few objections which have occurred to me in regard to the present system.

The report of the select committee of the House of Commons on weights and measures, ordered to be printed 28th May, 1821, states that the difference between a Winchester gallon, derived from the standard bushel, was 13 and 2-tenths cubic inches, equal to a difference of 105 and 6-tenths cubic inches in the bushel, which is hardly to be believed; and the report justly recommends that the subdivisions of weights and measures employed in this country be retained, as far better adapted to common practical purposes than the decimal scale.

And, lastly, I will refer to the fractions of cubic inches contained in the present imperial measures, of which a quart contains 69·308 cubic inches; a peck, 554·548; and a bushel, 2218·192.*—*T. N. P.*, *Shropshire.*

ON ORNAMENTAL BULBOUS PLANTS.

THE gaiety of the flower-garden in the earlier months of spring is chiefly dependent upon bulbous plants; the Crocus and the Snowdrop are, indeed, the first which greet the eye of the admirer of Flora. But the amateur, who is desirous of increasing his collection of this beautiful tribe, is frequently at a loss to know which are the most ornamental; or, even if he does, he is perhaps ignorant of the treatment they require. To those readers of the *Chronicle* who may be thus situated, the following remarks may probably be useful.

There are many kinds of bulbous plants, and those too by far the most pleasing, which never repay the care of the amateur when planted promiscuously in the border amongst other plants; but which will, if cultivated in separate beds and suitable soil, fully recompense for any extra attention which may be bestowed upon them.

To this class belong the numerous] beautiful tribes of Gladíolus, I'xia, Sparaxis, Watsónia, &c.; all of which are so closely allied, that the same treatment is applicable to the whole of them. To these may be added the Hyacinth, for the culture of which I must refer your readers to an excellent paper upon that subject by Mr. Storm.]

The two principal points to be attended to in the successful cultivation of the Gladíolus and I'xia are, to protect the beds in which the bulbs are planted from frost and from heavy rains, both of which are equally destructive. For both tribes, the beds should be composed of prepared soil, at least one foot deep, with perfect drainage at the bottom. That for Gladíoli should consist of two parts turfy loam, one of leaf-mould, and the remainder of well-rotted cow-dung and sand; for I'xias, the greater portion of the soil should be formed of sandy peat without any manure. In both cases, the beds may be made level with the surrounding surface, and towards the latter end of this month the bulbs may be planted *upon* them in rows, six inches apart each way: when covered over with soil, the beds will thus be raised a few inches above the ground level. Previously to spreading the soil over the bulbs, a small pyramid of sand should be formed over each, to assist in protecting them from damp. Gladíoli should be covered three inches with soil; I'xias, not more than two inches. After planting, a layer of dry, decayed leaf-mould, or tan from a spent bark-bed, should be spread three inches thick over the beds. Either of these will resist the rain for some time; but if there should be a continuance of wet, the beds should also be protected with mats secured upon hoops. The tan or leaves will likewise assist materially in excluding frost; when, however, this sets in severely, dry leaves should be laid over the surface to the depth of nine inches or a foot.

As spring advances, these materials may be gradually removed, and all the care that will be afterwards required will consist in tying up the flower-stems as they increase in growth. Unless the weather is very dry, the beds will not need water: if such should be the case, it should be liberally supplied, since the want of moisture in the growing season is just as destructive to I'xias, as a superabundance of it during their period of rest. If such beds are kept dry in winter, they will last for many years without replanting.

There are many more interesting bulbs, upon which it is needless here to dwell, as they will for the most part thrive in the borders amongst other plants. These are the Erythrónium Dens canis and americanum, Tigrídia pavónia, Pardanthus chinensis, Zephyranthes Atamasco and candida, Fritillária imperialis and meleagris, Leucojum æstivum and pulchellum; Scilla amœna, campanulata, and præcox; Asphodelus ramosus, taúricus, and lácteus; Van Thol, Sun's-eye, and Parrot Tulips; Ornithógalum pyramidale, &c.—*T. R.*

WEIGHT OF FINE HORTICULTURAL PRODUCTIONS.

WE to-day commence our promised reports upon this subject with the following instances. The weight is in all cases avoirdupois.

PINE-APPLE, *Enville:* weight, 7 lbs. 7 oz.; length without the crown, 10½ inches; breadth, 6 inches; number of pips in height, 12; crown middle-sized, cockscomb-shaped. Grown by Mr. Davis, gr. to Sir S. H. Clarke.

PINE-APPLE, *Providence:* weight, 8 lbs. 3 oz.; length, 10 inches; breadth, 6½ inches; number of pips in height, 10; crown small, with 4 trifling gill-suckers at the base of the fruit; form, conical. Grown by Mr. Davis.

PINE-APPLE, *Montserrat:* weight, 6 lbs. 6 oz.; length, 8 inches; breadth, 7 inches; number of pips in height, 8; crown small, cockscomb-shaped: a well-swelled, but not a handsome fruit. Grown by Mr. T. Forster, gr. to Viscount Downe.

PINE-APPLE, *Green Antigua:* weight, 5¾ lbs.; length, 8 inches; width, 6 inches; number of pips in height, 8; crown moderate, with 4 small gill-suckers: a well-formed fruit. Grown by Mr. B. Fielder, gr. to W. Linwood, Esq.

PINE-APPLE, *Black Antigua:* weight, 5¾ lbs.; length, 8½ inches; breadth, 5 inches; number of pips high, 10; crown full-sized: a handsome Pine. Grown by Mr. Lumsden, gr. to H. Bevan, Esq.

GRAPES, *Muscat of Alexandria:* weight of bunch, 2 lbs. 11 oz.; estimated number of berries, 260: the average weight of each berry would in this instance be somewhat more than 2½ drachms; bunch well formed, and free from any imperfection. Grown by R. Brook, Esq., of Pitstree, near Wickham Market.

GRAPES, *Muscat of Alexandria:* 3 bunches—two weighing 1½ lbs. each, the other 1 lb. 5 oz.; estimated number of berries, 300, giving an average weight of rather more than 3½ drachms to each; the bunches were not so compact as the preceding one, but the berries were considerably larger. Grown by Mr. Bailey, gr. to R. Thompson, Esq.

PEAR, *Beurré Diel:* No. 1—weight, 15 oz. 7 drs.; length of fruit, 4 inches; breadth, 3¾ inches. No. 2—weight, 15½ oz.; length, 4½ inches; breadth, 3¾ inches. Remarkably handsome specimens from a wall, grown by Mr. R. Thompson, Horticultural Society's Garden.

PEAR, *Belle et Bonne:* weight, 13 oz. 6 drs.; length, 3¼ inches; breadth, 3¾ inches. A very handsome fruit; grown by Mr. R. Thompson.

PEAR, *Seckle:* weight, 5 oz. 7 drs.; length, 3 inches; breadth, 2½ inches. This is generally a very small Pear, but the present specimen is sufficiently large for any dessert fruit, and is well formed. Sent by Mr. R. Thompson.

APPLE, *Alfriston:* weight, 12 oz. 7 drs.; height, 3 inches; breadth, 4 inches: a handsome fruit. Sent by H. G. B.

APPLE, *Reinette du Canada:* weight, 11 oz. 9 drs.; height, 3 inches; breadth, 3½ inches: remarkably well formed. Also from H. G. B.

AMATEUR'S GARDEN, No. XLI.

THOSE who have collections of fruit to gather and preserve, ought to be particulurly careful in gathering to prevent it from being bruised or injured in any way. The slightest blow or pressure upon the fruit, even although not visible on the outside at the time, will soon cause the whole to become rotten, and unfit for use. It will also be necessary to look over the shelves frequently, and remove all specimens which are beginning to rot; for one in this state very soon affects those which are near it, and rots them likewise. Grapes on the walls will now be nearly ripe; but if the weather continues fine, it may be desirable to allow those which have been protected to hang a little longer. Look over them and remove all berries injured by damp, or which have been partially eaten by birds or wasps.

Any greenhouse plants which are yet standing in the open air must now be got in without delay. Cuttings of Verbenas and other plants, recommended to be put in some weeks ago, will now be well rooted, and may be potted off. As the amateur may not have much room to spare, he had better put several plants in each pot, or fill a seed-pan or two with them, in which they can remain during the winter, to be afterwards potted off and propagated from next spring. As soon as the Scarlet Pelargóniums are so much injured by the frost as to look unsightly in the clumps or borders, they may be taken up, the soil shaken from their roots, the stems pruned down, and afterwards put into small pots, in which they can remain for the winter. If put into a warm place they will soon become green again, and will do well for turning out next year. Cuttings may even be struck in pans, and kept in them through the winter, if it is desirable; but if my former directions have been attended to, quite sufficient will be well rooted to render further propagation unnecessary. As these directions are prepared for those who are supposed not to have much accommodation for the purpose of striking cuttings, I have always been anxious to induce them to begin that work early, so that advantage might be taken of vigorous growth and warm air.

When the young plants of Verbenas, Petúnias, and things of that kind have been potted off and well watered, they must not be removed at once to the greenhouse, or exposed to too much light and air. It is by far the best plan to put them into a close frame, where they can be shaded for a few days until they form roots in the fresh soil. When this happens, they may be gradually hardened, and then removed to the greenhouse or pit, and kept free from frost during the winter. Many persons lose their plants after they are well rooted by not attending to this circumstance. The remarks upon American Evergreens, promised this week, must be deferred until next.—*R. F.*

HOME CORRESPONDENCE.

On Vegetable Self-combustion.—In as far as my experience goes, vegetable self-combustion may be ascribed to three different causes, each of which I shall illustrate by some example. I. *Self-combustion from physiological or structural causes.*—Of this only one case is extant, the correctness of which is doubted by Prof. Decandolle, but considered plausible by Dr. Meyen. According to a traveller, cited in the Annales des Voyages, there is a species of Pandanus in Africa, the flowers of which, at the moment of their expanding, produce a sort of lightning, which is accompanied by noise. The development of heat in the flowers of Pandanus utilis has been vindicated by Bory de St. Vincent (vol. ii. p. 85), and even the extremely strong odours in different species of Pandanus point at a powerful vital process, whereby an intense chemical affinity between the essential oils of the flower and the oxygen of the air is engendered —vital processes, which, if they be but somewhat more intense than in Dictamnus albus, might make the appearance of flames (lightning of the French traveller) easy to be conceived. At any rate, the case deserves the attention of African explorers. II. *Vegetable self-combustion from causes mechanical.*—To this cause, part of the self-ignition of Australian forests is to be ascribed. There are many species of Eucalyptus, the bark of which is a natural tinder, if we may so call it. Although the tree be in full vigour of vegetation, the bark (a couple of inches thick) is of a loose texture, fibrous, dry, and full of resinous matter, and has the appearance of Oakum, being used as tinder by the natives of New Holland. It is stated by every one in Australia, that the forests ignite spontaneously in hot and dry seasons; but as it can be but very rarely that any person should be present just at the moment when self-ignition takes place, the correctness of this statement has been doubted. In a country, however, so little inhabited, and where there are many localities which can only be arrived at by certain tracks, this popular belief is certainly not devoid of foundation. We are convinced, that if such a tree as Eucalyptus, through the effects of some heavy gale, be vehemently and rapidly rubbed against another tree, especially if the latter be dry and of a different texture (a Casuarina for example), that ignition will take place; and it may be assumed, after all, that it was from such experience that the primeval inhabitants of many countries derived their knowledge of obtaining fire by friction. That the Bamboo jungles in some parts of India ignite of themselves, has long been stated; and it has been lately ascertained that this is caused by their large culms being vehemently rubbed against each other, during a particular season, when heavy gales of wind are most prevalent. This phenomenon is the more easily accounted for, if we consider that there are Bamboos (for instance the Bulu-Tuy? of Malacca), the culms of which are so hard and replete with siliceous matter, that when cut down, sparks of fire are seen issuing from them. The articulations of this plant, moreover, are used for polishing iron. It is easy to be understood, that if a sudden gust of wind rubs such a plant against another, self-ignition will in many instances take place. III. *Vegetable self-combustion from chemical causes.*—This cause of ignition must be far more frequent in tropical or semi-tropical forests, than is generally supposed. The increased heat produced by accumulated and fermenting vegetable matters has been even taken advantage of by one or two Australian birds which hatch their eggs by placing them in such heaps. From the heat required to produce incubation, to that which may produce ignition, the step is not great. The operation which is performed by these artificially, will, as a matter of course, take place at times by the drifting of leaves, branches, decayed bark, &c., into ravines and crevices, which, by an adequate admixture of atmospheric or terrestrial matters, will engender all the requisites for fermentation; which, if carried on and modified appropriately, will finally produce ignition. The Euphorbia phosphorea in the Brazils, the fluid sap of which produces a diffused light, may be another example belonging to our present class of vegetable self-ignition. The belief that forests and bushes ignite spontaneously, is one widely spread over the globe. It exists on account of the last-mentioned plant in the Brazils, and I have found it prevalent in New Holland. It has been long entertained in India, and as has been stated (in Baumgärtner's Annalen der Phisik, Vienna, 1830), amongst the blacks of Hayti. The adoration which the Parsees, the Greeks and Romans rendered to fire is well known; yet it seems, after all, that even abstracting volcanic or semi-volcanic agencies, and the effects of lightning—man, when emerging from the general mass of the creation, had also some other sources at hand, whence he might possess himself of that Promethean element.—*A Traveller.*

To Preserve Half-hardy Border Plants through the Winter.—The gardener and the amateur will be busy in propagating by cuttings their half-hardy and other border plants, with which to beautify their flower-gardens next year; the plants now in them being left to be destroyed by the first frost. As Pelargóniums, Sálvias, Heliotropes, Verbenas, Pentstemons, and the like are not annuals, and as they acquire a considerable size during the summer, I have always regretted leaving them in the beds to be destroyed. Last autumn I took up a considerable number of border plants, and preserved them through the winter, and this summer I have been amply repaid for my trouble. The old plants, when turned out in the beds last spring, began to flower a month earlier than those raised from cuttings in the preceding autumn. It is worth some trouble to have the flower-garden gay a month earlier than usual, when the shortness of summer is taken into consideration. The young plants raised from cuttings require great part of the summer before they cover the beds and attain a flowering size; but the old plants commence blooming almost immediately after they are turned out. I suppose that the greatest objection to preserving old plants is, that they require so much more room; but it must be recollected that one of them covers as much space when planted out as three or four plants raised from cuttings in the autumn. Scarlet Pelargóniums being taken up, and the soil shaken from the roots, may be planted in old Mignonette boxes or pots filled with soil; if kept dry and divested of leaves they may be packed so thick as almost to touch each other. The back of the greenhouse, a frame or a shed where they can be protected from frost, will keep them tolerably well through the winter. If potted off singly in spring, and slightly forwarded in a vinery or any warm place, and afterwards gradually hardened before being turned out, they will flower much more abundantly than young plants. As for Verbenas, Petúnias, Pentstemons, &c., I think that if a frame was raised above the ground-level on a course or two of bricks, and filled up within a foot and a half of the top with cinders, and a layer of light soil put on them six or eight inches thick, the plants might be removed from the borders, with balls of earth at their roots; and, after thinning out the stems, that they might be planted in the soil in the frame instead of in pots. Such a method, I think, would be advantageous in one respect—more plants could thus be got into a frame than could be if they were put into pots. After the greenhouse plants have been finally arranged in their winter quarters, there may be room to stand a half-hardy plant here and there amongst them; and any thus preserved will be found valuable acquisitions to the flower-garden during the ensuing summer. Whether kept in the greenhouse or in the frame, the stems should be shortened as little as possible; if they are tied to sticks, they will be the better for it. I should think that Sálvia patens might be preserved by burying the tubers in dry sand. I have seen Fúchsias kept alive through the winter by covering the beds to the depth of six inches with dry turf or peat (the refuse of an old peat-stack). In frosty or wet weather an old tarpaulin was thrown over the beds, being supported on hoops; under such protection the tips only of the branches were killed. It is probable that if the beds in which Fúchsias are planted could by any means be kept dry through the winter, the stems of most kinds would be little affected by the frost. A great deal depends, also, upon the wood being well ripened. If the plants can be saved from being killed to the ground for one season, they will require less protection the following winter—because they will have a larger quantity of well-ripened wood in them. Ultimately, perhaps, they would stand the winter without any protection; but my experience has not as yet extended so far as to enable me to say positively that that would be the case.—*Observator, Prescott.*

Grafting.—I tried an experiment this year, which has so far exceeded my expectation that I venture to offer it to your notice. We sometimes hear regrets that such and such a valuable Apple does not afford a scion for grafting, and that the sort must therefore either be lost, or purchased at a distance, at some trouble and expense. I conceive that there is no need of either alternative, for I took in the spring two end shoots from an old tree that had not made any new wood *for years;* the ends of the scions were full of blossom-buds, and showed no signs of forming wood. They were grafted on crab-stocks of three years' growth, at the usual time, and in the common manner of whip-grafting; the scions took, and the blossoms showed themselves, being in some of the buds developed. While this process was at work, the sap overflowed, and the old scions were forced to make shoots, which at first had a singular effect, from their unnatural position in the midst of the blossoms; but as the *new wood* drew off the sap from the blossoms, they lessened and died away, and the very *spurs* on which they sprouted decayed also. Now that the *new shoots*, which are of full and vigorous growth, have attained their height, few people would discover in the flourishing young tree before them in the autumn, the old, withering scion of the spring.—"Pomaque degenerant, succos oblita priores."—Virg. Geor., lib. ii.

Pruning Roses.—Having seen in the *Chronicle* (p. 603) the communication on Budding Roses, as well as your wish for the author's experience in pruning them, I forward you the following remarks upon that subject:—Referring to "Practitioner's" observations, I am of opinion that the natural mode of propagation, both of the Laburnum and the Wild Rose Briar, must not be lost sight of. Some species of Cytisus, when grafted on the former, last but a short time—the stock growing stronger than the graft, the place of union decays, and the stock breaks out as high up as its trimmed condition will enable it. The Laburnum propagates by its seed. The Wild Briar, when budded with the Garden Rose, succeeds best certainly with those kinds which have the most luxuriant habit—especially with the Hybrid Chinas and Sweet Briars. Their duration is generally shorter when budded with the true Gállica, or those of more slender growth. As the birds eat most of the seeds of the Wild Briar, it must increase chiefly by suckers, which in its natural state appear before the original stem becomes very aged. In the gardens, therefore, with our Standard Rose trees, the reason is very clear why we have to witness the united effects of art and of nature. In pruning Roses, much must depend upon situation. My garden, containing upwards of 900 varieties, lies greatly exposed; the few China Roses which I can grow I have no opportunity of pruning, the winter generally killing them to the ground or nearly so. The same event happens with most of the Isle de Bourbons and several of the Noisettes. In the spring, I have only to cut away the dead wood; the Rosa Gállica I prune about the middle or third week of November, in doing which I cut them in very closely, leaving one, two, and sometimes three buds to preserve the form of the tree. The Hybrid Climbers I prune next:—having allowed them to grow freely, I shorten the main shoots but moderately (cutting away close in all superfluous and feeble shoots); the laterals I leave about four inches long. Some of the Pillar Hybrid Chinas I prune less than the rest of this division. The Provence, Hybrid Provence, and some of doubtful variety, with their buds farther apart than the true Gállica, I prune less closely than I do the Gállica. The same, to a greater degree, holds good with most of the Moss Roses. The climbing varieties of the Sempervirens and Ayrshire divisions require little more than to be thinned out. For the Boursault, Multiflora, and Hybrid Climbing, the treatment is much the same as that of the Hybrid China Pillar Rose, leaving some of the laterals longer in proportion as they may be required to cover vacant spaces. I only thin out the Sweet and Austrian Briars, unless their situation compels me for the sake of appearance. Most of the Alba and Damask Roses I prune less freely than the Gállicas, or more after the manner of the Hybrid Provence. I find the Perpetual, Hybrid Perpetual, and Four-Seasons Roses require more variation of pruning than any other kinds, some of them being more tender than others. As a general rule, the longer and straighter the growth of the wood, the less closely I cut them. To secure a good bloom, I also find it necessary to spare the knife a little with some of the Spotted, Striped, and Mottled Roses, although they may be of the Gállica tribe.—*K.*

Plants and Poisons.—What may be poisonous to man or other animals may not be so to plants, and we should err in our assumptions, in many cases, were such a conclusion hazarded. I am sorry that I have lost or mislaid the notes of numerous experiments I made many years ago, on plants supplied with metallic salts; but I remember that solutions of various salts of lead, and even arsenic (arsenic acid and arseniate of potassa, &c.), were, in many cases, the very reverse of injurious, being favourable to vegetation. Solutions of salts of iron and mercury I found very deleterious.—*J. Murray.*

Apples.—I find you want further proof respecting the gathering of Apples when wet. In my opinion, it does not matter the least whether they are wet or dry; if anything, I had rather gather them when wet, for if Apples be ever so dry when fresh pulled, they soon begin to perspire. This is what most gardeners call the first rot; but when gathered wet, they are greatly assisted in performing the act of perspiration, and I have generally found the loss among such fruit to be less than among those which had been gathered dry. I have also found that such Apples as the Nonpareil keep much better when they have been enclosed in an air-tight box. I have in this manner kept them as firm until the months of March and April as if they were fresh picked from the tree.—*T. Abbott.*

Weight of Pears, and remarkable Growth of Asparagus.—In the *Chronicle* of Aug. 27 you state that "A. F." (a correspondent) had cut from a bed planted in February 1840, a shoot of Asparagus 8 feet high. I have, in a bed planted in March 1841, a shoot upwards of 7 feet high, and 2 inches in circumference at the base. My gardener informs me there are several shoots much thicker. Pears of the following weights have also been gathered in my garden this autumn from trees bearing abundant crops:—Poire D'Auch, 11½ oz.; Beurré Diel, 11 oz.; Holland Bergamotte, 10 oz.; Easter Beurré, 6 oz.; Passe Colmar, 8 oz.; Marie Louise, 9 oz.; Crasanne, 7 oz.; and Beurré D'Aremberg, 7 oz.—*Wm. Sharp, Linden Cottage, near Burton, Westmoreland.*

Bees.—The question propounded by "A Novice," in p. 654, is not, of course, intended to be applicable to the present season, as the period of clustering has gone by. Clustering arises from the Bees being too numerous for their habitation, and it may in general be obviated by giving them an additional box; a super, if the stock be not a swarm of the current year—a nadir, if it be. In case of their refusing to avail themselves of such accommodation, or if their proprietor wish a swarm to issue from them—provided he has waited a reasonable time, and keeps his Bees upon the plan recommended in the "Honey-Bee"—he may succeed in the accomplishment of his wish, by furnishing a box with a portion of brood-comb containing eggs or very young larvæ from another family (better still by transferring to it a whole brood-comb, with the bar to which it is attached), and then adroitly removing the full box from its cluster to another part of his garden, letting an assistant promptly substitute the partly furnished box in its place. The cluster will soon enter it, and, finding comb and brood ready to receive them, will immediately set about raising a queen, build and store fresh combs, hatch out the brood, and proceed, in all respects, as if they had voluntarily occupied the box as a natural swarm; whilst the old family will, most of them, remain contentedly with the old queen, and carry on the business of the hive just as they would have done had they regularly thrown off a swarm. I have said, most of the family will do so, for a portion will, undoubtedly, join their companions in the new box—all, indeed, that happen to be abroad when the operation is performed. For this reason, if the cluster be very large, it would be best performed at night or very early in the morning; if small, in the middle of the day, that those Bees which will then be roaming the fields may, on their return, add to the strength of the artificial swarm.—*Edward Bevan, Llanferry.*

To destroy Thrips.—There are perhaps many of your readers whose Calceolarias are pestered with the thrip, which has this season caused the loss of great numbers. If they know no better remedy, I recommend them to get some well-dried fine Scotch snuff, and blow it through a *quill* over the leaves of the plants affected: this will effectually eradicate the pest. In two or three days they may be washed; and to prevent the plants from being soddened, it will be found advisable to place wash-leather or sponge upon the surface of the soil: this will absorb the water, which can be afterwards wrung out. I need hardly tell the cultivator of this beautiful tribe of plants that, if they get too much wet, the remedy will be as bad as the disease. In cases where the leaves are curled by the green fly, a blast of snuff through the quill, pointed under the leaf, will soon destroy the insects. If any of your readers know of a better plan to destroy the thrip, I shall be obliged by its communication through your columns. I have, however, saved my Calceolarias by the above means.—*E. Beck, Slate Works, Isleworth.*

Change of Seasons.—"The thick pleached alley that leads through the churchyard to the park is *putting forth its buds and leaves.* The *Lime-flowers* are sweet in the morning's breath. The *Chestnut* hangs its white blossoms over the grassy mounds of that resting-place." Thus writes a clever author of the present day. What a pity it is that literary men should know so little of nature—or that, knowing so much less than nothing, they should write about her beauties! The seasons must be wonderfully changed to bring Lime-tree flowers and Chesnut blossoms, of whatever kind, and budding trees, all into vegetation at the same moment. Methinks it is not thus that the genius of Shakspeare, and of all true poets, has shone forth. ALL *their* natural images, which strike so forcibly upon the feelings, excite our admiration or command our attention by their perfect truth, and the entire absence of that confused mixture of impossible coincidences which form the tinselly stock of half our modern poetasters.—*Argus.*

FOREIGN CORRESPONDENCE.

Algiers, September 12th, 1842.—The following account will give some idea of the progress which agriculture and horticulture are making in this new French colony. The plans laid down by Marshals Clausel, Vallée, and the deeply-lamented Duke of Orleans, are being strictly carried into effect by the intelligent Governor-General Bugeaud, assisted by Generals Lamoricière, Changarnier, Négrier, D'Arbouville, and other experienced officers, forming the Etat Major of the army of Africa. —Since France has gained possession of Algeria, her ambition has been establishing Military Agricultural Colonies, similar to those of Russia. This grand object is now likely to be successfully carried into effect; and it is truly surprising to see the great improvements that have been made within the last twelve or thirteen years (since the landing of Marshal Bourmont) in this once den of pirates. Moorish Algiers of 1829, and French Algiers of 1842, are two distinct cities. The colonists are making rapid progress in agriculture and horticulture; well-cultivated fields, teeming with wheat and corn of every description, are now to be seen, which, but a few years ago, were a barren waste. Orchards and gardens producing the most exquisite fruits and flowers, natives of Europe, Asia, and America, are smiling to one's view, and vegetation of every description thrives well. In many districts some extensive vineyards have been planted with shoots of the most superior qualities of Portugal, Spanish, Rhenish, Moselle, Côte d'Or, and other celebrated Grapes of France; and with Olive-trees, which promise to be a most important article of profit to the speculators, who have obtained large grants of land from Government, on condition that they shall cultivate this prolific soil to the most advantage. The Sugar-cane appears to thrive well in this climate, as do also the Cacti, or prickly Pears of Spain and South America, the Olive, Orange, Fig, Almond, and Date, but particularly the Mulberry-tree, which is planted in every direction, for the purpose of propagating the silk-worm, which may, with care, be brought to equal perfection with those of Italy, Persia, Egypt, and China. In a few years' time the colonists will be able to produce a sufficient quantity of sugar to supply the markets here, without importing it from Marseilles, and at a much lower price than it is there sold. Horses, mules, camels, oxen, cows, goats, and sheep are most abundant. The latter are of the Merino breed, and are valuable for their wool, which is equal to that of Spain and Saxony. As great encouragement is given by the Government for increasing the breeds, wool will become an important article of commerce to the colony for exportation to France, which is annually obliged to import a considerable quantity from England and other parts, to supply her manufactories of Elbœuf, Sedan, &c. The military-agricultural colonists are building themselves villages near the main roads to Constantina, Mascara, Oran, Bona, Philipville, and near the coast, according to the soil they may require for their productions; as every quality of soil is here to be met with. These villages are built with great taste, and the habitations are very conveniently constructed, with gardens both at the front and back, filled with flowers, fruit, and vegetables. The fields adjoining are also cultivated by these settlers, the greater part of whom are old retired soldiers, who for the last 20 or 25 years have tilled the land in France, and are now become proprietors themselves; others are soldiers, whose time of service being expired, prefer remaining in this country as free emigrants; and thus the whole form a little independent colony, assisting each other. As an encouragement, the French Government send them over annually a certain number of young female emigrants, to be chosen as their wives, at the same time allowing each female, on her marriage, a sum varying from 200 to 300 francs to commence housekeeping with, and to enable her husband to purchase such implements and utensils as he may most require. Great praise is due to the Military authorities for their exertions in converting this once desert country into a flourishing and civilised nation. Artesian and other wells have been sunk, so that the inhabitants are well provided with excellent water, not only for their personal consumption, but for irrigating their lands by means of small canals, that are cut through the different allotments. Excellent roads have been constructed in every direction, with a Military station at intervals of a few leagues; and there being a telegraph in all the villages to give the alarm in case of a sudden attack from the Arabs, the settlers appear not to have the slightest fears, as they are all well armed, and form a strong national Yeomanry Guard in case of any emergency, until a Military force could come to their assistance. Indeed, one may travel without perceiving that he is surrounded by hordes of Arabs, who will never submit to the government of the tri-coloured flag. If well encouraged, the emigrants and free settlers will, no doubt, in course of time, find Algeria a second Provence, as every necessary of life can be produced, so fertile is the soil, if manual labour will but lend its assistance.

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

Oct. 4.—Sir O. Mosley, Bart., in the chair. The Count de Salis, H. Hornby and E. St. Vincent Digby, Esqrs., were elected Fellows. The following important announcement was made:—That such members as may be desirous of determining the names and qualities of fruits *for their own use* will, on application, be supplied with specimens of such varieties as the Garden of the Society produces. Not more than two specimens of any sort will be sent, and the expense of package and carriage will be charged to the members making application for them. If a second supply of the same fruit should be required, it will not be furnished gratuitously. Mr. Goode, gr. to Mrs. Lawrence, exhibited a large collection of stove and greenhouse plants; amongst which the most conspicuous were a noble specimen of the pretty Epidendrum ciliare; Oncidium Harrisóniæ, bearing half a dozen graceful panicles of yellow flowers mottled with light brown; On. microchilum, a species of rather late introduction, the appearance of which is not particularly striking, but which will, nevertheless, appear to more advantage on minute inspection; the beautiful orange-coloured Dendróbium chrysanthum, with a dark brown spot on each side of the labellum; a singular species of Myanthus, the perianth of which is green, spotted and banded with brown, while the labellum is white densely studded with very prominent tubercles; Sedum Sieboldi, a plant which, although hardy, does not grow to perfection in the open air, but succeeds best when treated as a greenhouse plant; in which condition its numerous branches, each bearing a cluster of rose-coloured star-like flowers, droop around the sides of the pot and produce a pretty effect; two well-grown plants of Crówea saligna were also sent by Mrs. Lawrence, and it is difficult to imagine anything more beautiful than these specimens, with their delicate pink blossoms, thickly interspersed amongst the graceful willow-like foliage; a large plant of Leonotis Leonurus, six feet high, and covered with dense clusters of its bright orange or rather vermilion coloured flowers, ought not to be forgotten; although for many years this has fallen into neglect, it is certainly a plant which deserves to be more generally cultivated; a Knightian medal was awarded for Oncídium microchilum and the two Cróweas. Messrs. Veitch, of Exeter, exhibited a plant of their new blue Tropæ'olum, supposed to be T. azúreum; this is a most interesting introduction, with a slender climbing habit, like T. tricolor; the flowers are, however, of a lighter blue than was expected, and bear some resemblance to those of Leschenaúltia bíloba, but this deficiency of colour might, perhaps, have been occasioned by its peculiar treatment not being yet sufficiently known; a branch of Arália japónica was also sent by Messrs. Veitch, which is less remarkable for the beauty of its flowers than for its being a new hardy shrub of singular habit; the leaves are bipinnate, two feet and a half in length, and at least two feet wide; the flowers are white, and appear in large spreading masses at the ends of the shoots. A large silver medal was awarded for the Tropæ'olum. A still finer specimen of Arália japónica was exhibited by E. Johnston, Esq. From Mr. Quesnel, of Havre, there were plants of Æchmea fulgens, introduced from Pernambuco, in Brazil, with flowers of the most vivid scarlet tipped with violet; and a species of Billbérgia, with beautiful greyish-white foliage banded with dark brown, not unlike the plumage of some bird; both plants are found, in their native country, growing upon the trunks of trees; a Knightian medal was awarded for them. From Mr. C. Adams, gr. to Mrs. Morris, a species of Læ'lia, the flower of which is small, and of a rosy purple colour, but not particularly attractive. From Mr. T. Williams, of Oldford, Birmingham, a cut flower of Maxillária macrophylla, which, like the preceding plant, is not possessed of much beauty. Mr. Brown, of Slough, exhibited a remarkable good collection of Dahlias, for which a Banksian medal was awarded. From Messrs. Paul, of Cheshunt, was a large collection of Roses, much finer than could have been expected at this season of the year. Messrs. Lane, of Berkhampstead, also sent an extensive collection of Roses, which contained some handsome flowers. From Mr. G. Cockburn, of Ken-wood, was a plant of Lycium aggregatum, in full bloom: the greenish-white flowers of which are produced in clusters, and diffuse an agreeable fragrance. From Mr. Turville, 6 blooms of his seedling Dahlia, called Essex Triumph; the colour is a very deep maroon, and the flower is certainly one of the best which has yet been raised. From Mr. Groom, of Clapham, an Agapanthus, called A. máximus, of a more robust habit than A. umbellatus, to which it is decidedly superior. From Mr. Smith of Hornsey, two seedling Fúchsias, one called F. globosa grandiflora; the other, fulgens coccínea. A Seedling Fúchsia, nearly allied to F. fulgens, but having shorter flowers, was exhibited by Messrs. Cormack and Oliver, of Deptford. Messrs. Smith, of Hackney, exhibited several blooms of a white Seedling Dahlia, called Bianca. A Seedling Heartsease, named the Prince of Wales, was sent by Mr. H. Silverlock, of Chichester. A collection of Heartsease was exhibited by Mr. J. May of Tottenham. The Pines and Grapes exhibited were many of them excellent specimens of cultivation; a more particular account of them will be found in another column of our Paper. From Mr. Fleming, gr. to the Duke of Sutherland, were two fine Providence Pine-apples of the respective weights of 6¾lbs. and 5lbs. 6oz.; with two specimens of the Housainee Melon, one of which weighed 5lbs. 3oz., the other 3lb. 6oz. A Banksian medal was awarded for the Pines. From Mr. Davis, gr. to Sir S. H. Clarke, Bart., a remarkably large Providence Pine-apple, of a conical form, and weighing 8lbs. 3oz.; also a noble Enville, weighing 7lbs. 6oz.; in both instances the crowns were comparatively small: a Knightian medal was awarded for them. Mr. T. Forster, gr. to Viscount Downe, exhibited an uncommonly well-swelled Montserrat Pine-apple, weighing 6lbs. 6oz., for which a Knightian medal was awarded. From Mr. B. Fielder, gr. to W. Linwood, Esq., there was a handsome specimen of the Green Antigua Pine, for which a Banksian medal was awarded. Mr. Lumsden, gr. to H. Bevan, Esq., exhibited a well-formed Pine-apple, weighing 5¾lbs., which was introduced by the late Mr. Aldridge as the true Trinidad, but which proves to be nothing more than the Black Antigua —a Banksian medal was awarded for it. From Mr. Henderson, gr. to Sir G. Beaumont, Bart., six handsome Queen Pine-apples, weighing respectively 3lbs. 9¼oz., 3lbs. 8oz., 3lbs. 8oz., 3lbs. 1oz., 2lbs. 14oz., and 2lbs. 13oz.; for which a certificate was awarded. From Mr. Errington, gr. to Sir P. G. Egerton, Bart., a Russian Globe and a Jamaica Pine-apple, the former weighing 4lbs. 6oz., the latter 3lbs. 11oz. From Mr. M'Evoy, gr. to Sir B. Chichester, Bart., a well-formed Enville Pine-apple, weighing 2lb. 9oz., grown under peculiar circumstances; the plant by which it was produced, along with many others, having been wintered, from October until February last, in a cold vinery, where the thermometer frequently settled below the freezing point; as a matter of course, the plants lost all their roots, and were repotted in peat soil, into 48 and 32-sized pots, and fruited in 24s; the present fruit started early in March, soon after potting, and before the reproduction of roots, otherwise there is little doubt but it would have been much larger. From R. Brook, Esq., a noble bunch of Muscat of Alexandria Grapes, weighing 2lbs. 11oz.; the berries were not above the average size, but they were very regular: a Banksian medal was awarded for it. Mr. J. Bailey, gr. to R. Thompson, Esq., also exhibited three bunches of Muscat of Alexandria Grapes, two of which weighed 1¼lb., the other 1lb. 5oz.; the berries of these bunches were considerably larger than those of the preceding, but they had not set so regularly, neither were the bunches so well formed: a certificate was awarded for them. From Mr. Frost, gr. to Lady Grenville, were 3 bunches of unusually fine Black Hamburgh Grapes, and a bunch of the white Nice; for the former a Banksian medal was given. From Mr. J. Barnes, gr. to Lady Rolle, specimens of the fruit or nuts of the Cycas revoluta; these are of a bright vermilion colour, and are produced along the sides of short leaves, thrown up from the centre of old plants, and which tend greatly to confirm the opinion that fruit is a modification of the leaf. Mr. E. Spirey, gr. to J. Tharp, Esq., sent a brace of enormous seedling Cucumbers, about 2 feet long, and remarkably straight. A brace of Cucumbers were also exhibited by Mr. Bowers, of Laleham. From Mr. Giblett, of Bond-street, was a dish of uncommonly fine Nonpareil Apples. An Apple, resembling a scarlet Nonpareil, was exhibited, having exactly one half of its surface red, whilst the other half was green. The red was of uniform intensity so far as it extended, and its limits were as definite as if a line had been drawn on either side from the eye to the stalk; in fact, one half of the latter was also red, and the other half green. From the garden of the Society were collections of plants and fruit; amongst the former were Achimenes pedunculata, introduced last year from Guatemala; it possesses the habit of a Gesnera, and bears its beautiful scarlet and orange flowers in abundance on long footstalks: Niphæa oblonga, also from Guatemala, of a dwarf habit, and producing masses of white blossoms, which contrast well with the dark green foliage; the pretty Brasavola venosa, and Fúchsia Wormaldi, an interesting variety with much of the habit of F. microphylla, but a more abundant bloomer; the flowers also are larger, with somewhat reflexed petals: there were likewise two well-grown plants of Sedum Sieboldi, but of a paler tint than that exhibited by Mrs. Lawrence; with cut flowers of Odontoglossum grande, and the sweet-scented Mandevilla. The fruit consisted principally of Pears, of which the best were Gansell's Bergamot; the Seckle, a small, but very highly-flavoured kind: the Flemish Beauty, and Louise Bonne (of Jersey). Some Wormsley Pippins were also exhibited; it is stated to be a good bearer, and a finely-flavoured Apple for kitchen purposes; on account of its size it cannot be used for dessert, otherwise it would be preferred to most others of its season.

FLORICULTURAL SOCIETY.

Oct. 4.—Mr. Barnard in the chair. Mr. Mitchell and Mr. Humber were elected members. It was resolved, that in consequence of the fraudulent manufacturing of a Dahlia, exhibited for a prize by Messrs. Brown and Atwell, of Uxbridge, in a stand of 36 blooms, at the Show on the 20th of Sept. last, they be expelled the Society, according to the 10th rule. It was also agreed, that on account of their improper conduct at the same exhibition, Messrs. Tyler should not be allowed to exhibit at any of the succeeding meetings. The only first-class seedling Dahlias present were six blooms of Mr. Turville's Essex Triumph, which still retains its superior character. Numerous others of 1841 and 1842 were brought for judgment. Mr. Brown, of Slough, exhibited a large collection of Dahlias, which, for regularity, could scarcely be surpassed. A very good collection of Roses was also sent by Messrs. Paul, of Cheshunt.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

Sept. 23.—The Fruit and Dahlia exhibition took place in the Experimental Garden, Inverleith. The competitors were numerous on this occasion, and both the fruits and flowers were first-rate. The day proved unfavourable; but still a highly-respectable company visited the garden, and were delighted with the productions, which filled both the new Hall and the large tent on the lawn. The Fruit Prizes were awarded as follows:—PEACHES, Mr. R. Watson, gr. to D. Anderson, Esq. NECTARINES, Mr. Alex. Temple, gr. to O. T. Bruce, Esq. BEST 3 SORTS OF GRAPES, *exclusive of Muscat,* 1, Mr. P. Crocket, gr. to Col. Ferguson, for Black Hamburgh, Grizzly Frontignan, and White Frontignan; 2, Mr. D. Brewster, gr. to Col. Lindsay, for Grizzly Frontignan, Black Hamburgh, and Black Frontignan; 3, Mr. H. Aitken, gr. to Mr. Skene, for Black Hamburgh, Black Prince, and Royal Muscadine. *Muscat of Alexandria,* 1, Mr. J. Young, gr. to Mrs. Ferguson; 2, Mr. J. Lindsay, gr. to P. Chalmers, Esq.; 3, Mr. Crocket. PINE-APPLE, *exclusive of Queen,* 1, Mr. J. Gavin, gr. to the Earl of Moray, for a large Enville, weighing 5¾lbs.; 2, Mr. J. Weir, gr. to Lord Douglas, for a Montserrat; 3, Mr. Temple, for a Scarlet Brazilian; and, 4, Mr. Alex. Smith, gr. to W. Forbes, Esq., for a Black Jamaica. *Queen,* 1, Mr. J. Dodds, gr. to the Earl of Mansfield; 2, Mr. Smith. PLUMS, 1, Mr. J. Goodall, jun., gr. to L. Buchan, Esq., for Green-gage, Yellow-gage, Orleans, and White Magnum bonum; 2, Mr. G. Monro, gr. to Lord Gillies, for Green-gage, White Magnum bonum, Coe's Golden-drop, and Wine-sour. MELONS, 1, Mr. D. Foulis, gr. to Alex. Blair, Esq., for Alston's Green-fleshed: 2, Mr. Brewster, for Arkley's Green-fleshed. JARGONELLE PEARS, 1, Mr. J. Pousty, gr. to J. Giles, Esq.: 2, Mr. J. Addison, gr. to the Earl of Wemyss. *Three sorts of Pears, exclusive of Jargonelle,* 1, Mr. J. Murray, gr. to A. Fletcher, Esq., for Marie Louise, Gansell's Bergamot, and Green Pear of the Yair; 2, Mr. Smith, for Impératrice de la France, William's Bon Chrétien, and Summer St. Germain. For some *ripe clusters of the Frankenthal Grape, from a flued wall, without glass,* at Erskine House Garden, the Society's silver medal was voted to Mr. G. Shiells, gr. to Lord Blantyre. A premium was awarded to Mr. D. Campbell, gr. to J. Dewar, Esq., for a basket of *Warrington Red Gooseberries,* in excellent state, notwithstanding the warmth and earliness of the season. The bushes were trained twelve feet high against a wall having a north aspect; only three shoots were allowed to proceed from each root or bush, and these were pruned twice a year. DAHLIAS—SUBSCRIPTION PRIZE OF 3 SOVEREIGNS, *for the finest twenty-four blooms produced by nurserymen,* Messrs. T. and W. Handasyde, for Coronation, Beauty of the Plain, Highgate Rival, Attila, Lee's Bloomsbury, Westbury Rival, Girling's Prince of Wales, Jeffrey's Climax, Widnall's Argo, Invincible, Oriental Pearl, Mrs. Shelley, President of the West, Phenomenon, Pickwick, Maid of Bath, Garrick, Duke of Cornwall, Hope, Rival Sussex, Miss Abbot, Burnham Hero, Dodd's Prince of Wales, and Marquess of Lothian: 2, Messrs. J. Dickson and Son; 3, Messrs. Eagle and Henderson. SUBSCRIPTION PRIZE OF 2 SOVEREIGNS, *for the finest eighteen blooms, exhibited by gardeners,* Mr. P. Thomson, gr. to J. J. Hope Vere, Esq., for Beauty of the Plain, Marquess of Lansdowne, President of the West, Queen of Lilacs, King of Roses, Lady Cowper, Scarlet Eclipse, Attila, Princess Royal, Yellow Climax, Pickwick, Phenomenon, Grande Baudine, Rouge et Noire, Glory of Plymouth, Indispensable, Prince of Wales, and Burnham Hero: 2, Mr. Dodds; 3, Mr. J. Hogg, gr. to W. Bonar, Esq.; 4, Mr. W. Sharpe, gr. to Sir J. Richardson, Bt. SILVER MEDAL, *for the best 12 blooms, produced by Amateurs,* 1, Mr. A. Ambrose, for Yellow Defiance, Phenomenon, Maid of Bath, Pamplin's Bloomsbury, Prince of Wales, Indispensable, Grande Baudine, Pickwick, Maria, President of the West, Beauty of the Plain, and Windsor Rival; 2, A. Symington, Esq.; 3, I. Anderson, Esq. With regard to SEEDLING DAHLIAS, the Committee made the following report:—"No fewer than fifteen competitors produced *seedling Dahlias, raised either in* 1841 *or* 1842; but as the programme specified that, 'unless the seedling be of real merit,' no prize would be given, the Committee, after a careful investigation, felt themselves bound to report, that no premium could at this time be awarded, there not being sufficient novelty in colour, or improvement in form, from established sorts." EXTRA PRIZES —To Mr. W. Anderson, *for a model of a fancy cottage, flowerpot, and jet d'eau*; to Mr. R. Mossman, gr. to J. Hunter, Esq, for *specimens of the bullock's-heart Capsicum, and for an American Gourd*; to Mr. J. Lyall, gr. to Sir J. Hope, Bart., for a *large and handsome Gourd*; and to Mr. J. Young, gr. to T. Oliver, Esq., for a box of *French Marygolds*. Several collections, both of flowers and fruits, were sent for exhibition only. Extensive collections of Dahlia flowers were from the nurseries of Messrs. Dickson & Co.; Eagle & Henderson; Lawson & Son; and Handasydes. Messrs. J. Dickson & Son, Inverleith, sent also some rare plants, particularly Niphæa oblonga, which had not before been seen in flower at Edinburgh. Mr. Finlayson exhibited a number of Seedling Pansies, remarkable for their variety and beauty; Mr. Anderson, a Seedling Fúchsia; Mr. Gavin, some large heads of Celósia cristata; Mr. Hopkirk, gr. to Sir C. Ferguson, African Marygolds; Mr. Downie, gr. to Gen. Robertson, select Dahlia flowers; and Mr. Granger, Dahlias and Marygolds. Messrs. Sang exhibited named specimens of Pears and Apples; Mr. Sharpe, specimens of Cellini and Emperor Alexander Apples; Mr. A. Stevenson, specimens of Ribstone and Paradise Pippins, from the garden of Breckcolly, in the Island of Coll, one of the Hebrides; Mr. Denholm, gr. to the Lord Provost, a good collection of Standard Apples; and Mr. Scroggie, gr. to J. Kennedy, Esq., some remarkably large specimens of Apples.

COUNTRY SHOWS.

Anglesea Horticultural Society, Aug. 26.—The annual show of flowers, fruit, and vegetables, was held at Beaumaris and attracted a numerous company. The following prizes were awarded:—ORCHIDACEOUS PLANTS: 1, Epidendrum elongatum, H. Beaver, Esq.; 2, Cymbidium Aloifólium, Sir R. Bulkeley. STOVE PLANTS: 1, Russéllia júncea, Sir R. Bulkeley; 2, Russellia júncea, H. Beaver, Esq.; 3, Húmea elegans, H. Beaver, Esq. GREENHOUSE PLANTS: 1, Sir R. Bulkeley; 2, Bishop of Bangor; 3, H. Beaver, Esq. TENDER ANNUALS: 1, Phlox Drummondi, H. Beaver, Esq.; 2, Clintónia élegans, Bishop of Bangor. HARDY HERBACEOUS PLANTS: 1, Gladíolus floribundus, J. Williams, Esq.; 2, Státice latifólia, Bishop of Bangor; 3, Pénstemon Richardsónii, Sir R. Bulkeley. HALF-HARDY SHRUBS: 1, Fúchsia fulgens, H Beaver, Esq.; 2, Fúchsia fulgens, Sir R. Bulkeley. DAHLIAS: 1, Bishop of Bangor; 2, H. Beaver, Esq.; 3, do.; 4, Mr. Batley; 5, Rev. W. Trevor. *Single Dahlias*, 1, Mr. Batley; 2, Bishop of Bangor. BOUQUETS: 1, Sir R. Bulkeley; 2, H. Beaver, Esq.; 3, Mrs. Weldon. PELARGONIUMS: 1, Sylph, Sir R. Bulkeley; 2, Joan of Arc, Sir R. Bulkeley; 3, Conservative, Sir R. Bulkeley. ERICAS: 1, Erica Hartnelli, H. Beaver, Esq.; 2 and 3, Erica Hartnelli, R. M. Preece, Esq. BALSAMS: 1, Sir R. Bulkeley; 2, H. Beaver, Esq.; 3, Sir R. Bulkeley. COCKSCOMBS: 1, Hon. Major Vivian; 2 and 3, Sir R. Bulkeley. BEST 4 PELARGONIUMS: H. Beaver, Esq. *Best three*, Bishop of Bangor. FRUIT: *Best basket*, 1 and 2, Sir R. Bulkeley. PINES: 1, *Montserrat*, Sir R. Bulkeley; 2, *Queen*, Sir R. Bulkeley; 3, Hon. Major Vivian. MELONS: 1, *Harewood*, Sir R. Bulkeley; 2, *Stafford*, ditto: 3, *Beechwood*, ditto; 4, *Egyptian Greenfleshed*, ditto. CHERRIES: 1 and 2, Col. Pennant. FIGS: 1 and 2, Col. Pennant. GRAPES: *White*, 1, *Nice*, R. Thomas, Esq.; 2, *Muscat*, H. Beaver, Esq. *Black*, 1, *Hamburgh*, R. Thomas, Esq.; 2, *Lombardy*, Ditto. PEACHES: 1, C. H. Evans, Esq.; 2, R. Thomas, Esq.; 3, Sir R. Bulkeley. PLUMS: 1, H. Ford, Esq.; 2, Bishop of Bangor; 3, Col. Pennant. DESSERT PEARS: 1, H. Ford, Esq.; 2, *Jargonelle*, J. Wyatt, Esq.; 3, *Lawrence Lemon*, Col. Pennant. APPLES: 1, *Oslin Pippin*, Col. Pennant; 2, *Lady Derby*, J. Wyatt, Esq. *Culinary*, 1, *Emperor Alexander*, J. Wyatt, Esq.; 2, *Hawthorndean*, Rev. Dr. Williams. CUCUMBERS: 1, Sir R. Bulkeley; 2, R. Thomas, Esq.; 3, H. Ford, Esq. CELERY: 1 and 2, Rev. J. W. Trevor; 3, Col. Pennant. CAULIFLOWERS: 1, Col. Pennant. BROCCOLI: C. H. Evans, Esq. FRENCH BEANS; 1, Bishop of Bangor; 2, Col. Pennant. LETTUCE: 1, H. Ford, Esq.; 2, H. Beaver, Esq.; 3, Col. Pennant. CARROTS: 1, *Altringham*, — Mayhew, Esq.; 2, *Altringham*, Rev. Dr. Williams. ONIONS: 1, Sir R. Bulkeley; 2, Mary Parry; 3, G. Jones. LEEKS: 1, Rev. Dr. Williams; 2, H. Ford, Esq. BEETROOT: 1, Admiral Lloyd; 2, — Mayhew, Esq. PARSNEPS: 1, Rev. Dr. Williams; 2, J. Lloyd. BUNDLE OF KITCHEN HERBS: 1, Col. Pennant; 2, Sir R. Bulkeley; 3, Mrs. Weldon. EXTRA PRIZE: *Red Cabbage*, H. Ford, Esq. An exhibition exclusively for cottagers' productions took place the day preceding at Llangefni, when numerous prizes were awarded.—*North Wales Chronicle.*

Aylesbury Horticultural Society, Sept. 8.—The annual meeting was held in the County Hall, Aylesbury, where the prizes were awarded as follows:—DAHLIAS: 1, Mr. Soden, for Admirable, Indispensable, President of the West, Pickwick, Grace Darling, Springfield Rival, Maria, Phenomenon, Conservative, Conqueror of the Plain, Bridesmaid, and Fanny Keynes; 2, Mr. Harwood, for Admirable, Conservative, President of the West, Grace Darling, Hudson's Princess Royal, Springfield Rival, Lewisham Rival, Pickwick, Maria, Eclipse (Widnall's), Conductor, and Burnham Hero; 3, Mr. H. Sherriff, for Andrew Hofer, Charles XII, Widnall's Queen, Lewisham Rival, Rouge et Noire, Admirable, Hope, Essex Rival, Rienzi, Beauty of the Plain, Conservative, and Nicholas Nickleby; 4, Mr. I. K. Mr. Horwood exhibited some blooms of his *Seedling Princess Royal*, which were greatly admired. MELONS: 1, Mr. Robertson; 2, Mr. Taylor; 3, Mr. Cowley; 4, Mr. Smith. PANSIES: 1, Mr. Hunt; 2, Mr. Ivey; 3, Mr. D. Stevens; 4, Mr. Ivatts. PEACHES: 1, Mr. Margesson; 2, Mr. Sherriff; 3, Mr. I. K. Fowler, jun.; 4, Mr. Robertson. CUT FLOWERS: 1, Mr. I. K. Fowler, jun; 2, Mr. W. Green. GRAPES: 1, Mr. Robertson; 2, Mr. Mavor. PRESIDENT'S PRIZE for *Grapes*, 1*l.* 1*s.*, Mr. Robertson. PLUMS: 1, Mr. Mayne; 2, Mr. Robertson; 3, Mr. Green; 4, Mr. H. Tell.

Bath Royal United Horticultural Society, Aug. 18.—The fifth exhibition was held in the Sydney Gardens. The following is a list of the prizes: FLORISTS' FLOWERS AND CUT FLOWERS—*Nurserymen:* DAHLIAS, 24 *varieties*: 1, Mr. Maule; 2, Mr. Drummond; 3, Mr. Walters. GERMAN STOCKS: 1 and 2, Mr. Cole. HOLLYHOCKS: 1, Mr. Tylee; 2, Mr. Wheeler. COLLECTION OF CUT FLOWERS: 1, Messrs. Salter and Wheeler; 2, Mr. Lidiard. *Amateurs:* DAHLIAS: *collection of* 18, 1, J. M. Yeeles, Esq.; 2, T. Emerson, Esq.; 12 *varieties*, 1, T. Emerson, Esq.; 2, Mr. C. Sainsbury; 6 *varieties*, 1, Mr. Gready; 2, T. Emerson, Esq. GERMAN ASTERS: 1, Mr. C. Sainsbury; 2, Mr. Reed. GERMAN STOCKS: 1 and 2, G. Yeeles, Esq. HOLLYHOCKS: 1, A. Lawrence, Esq.; 2, T. Emerson, Esq. ANNUALS OR BIENNIALS: 1, Miss Bayley. COLLECTION OF CUT FLOWERS: 1, J. M. Yeeles, Esq.; 2, T. Emerson, Esq. FLOWERING PLANTS IN POTS —*Nurserymen:* STOVE PLANTS: 1, Messrs. Salter and Wheeler. GREENHOUSE PLANTS: 1, Messrs. Salter and Wheeler. BASKET OF PLANTS, Mr. Drummond. *Amateurs:* ORCHIDACEOUS: 1, J. Jarrett, Esq.; *Single Specimen*, J. Jarrett, Esq. STOVE PLANTS: 1, J. Jarrett, Esq.; *Single Specimen*, J. Jarrett, Esq. GREENHOUSE PLANTS: 1. J. Jarrett, Esq.; 2, Miss Bayly. COCKSCOMBS: 1, J. M. Yeeles, Esq.; 2, W. Miles, Esq., M.P. BASKET OF PLANTS: 1, J. M. Yeeles, Esq.; 2, Miss Bayly. FRUIT—PINEAPPLES: *Queen*, 1 and 2, Mr. Hatch, gr. to P. J. Miles, Esq.; *Black*, 1, Mr. Spencer, gr. to the Marquess of Lansdowne; 2, Mr. Hatch. GRAPES: *Black*, 1, Mr. Ford; 2, Mr. Spencer; 3, Mr. Pyatt; *White*, 1, Mr. Hatch; 2, Mr. Pyatt; 3, W. Miles, Esq., M.P. *Best bunch of any sort*, Mr. G. Shaw. MELONS: 1, W. Miles, Esq., M. P.; 2, T. M. Cruttwell, Esq.; 3, R. Strachey, Esq. PEACHES: 1, Mr. W. Salter; 2 and 3, C. Baker, Esq. NECTARINES: 1, Mr. W. Salter; 2, C. Baker, Esq.; 3, Mr. Lidiard. FIGS: 1, W. Miles, Esq., M.P.; 2, J. Wiltshire, Esq. APRICOTS: Mr. Hatch. GREENGAGES: 1, W. Miles, Esq., M.P.; 2, Mr. Hatch. PLUMS: 1, Mr. W. Salter; 2, Mr. J. Cook. CHERRIES: 1, Mr. Pyatt; 2, B. C. Smith, Esq. PEARS, *Dessert*: 1, Mr. Hatch; 2, Mr. Salter. APPLES, *Dessert*: 1, G. Moger, Esq.; 2, Mr. Sparks. *Culinary*: 1, Mr. Minty; 2, Mr. Sparks. RASPBERRIES: 1, R. S. Cruttwell, Esq.; 2, Mr. Gerrish. GOOSEBERRIES: Mr. Lidiard. CURRANTS: G. Yeeles, Esq. *C. Gomonde, Esq.'s Prize of One Guinea for the best Melon:* T. Emerson, Esq., Bathwick. VEGETABLES, COLLECTION OF 6 SORTS: 1, Mr. J. Cook; 2, Mr. Cooper; 3, Mr. Lidiard. 4 *sorts*: 1, Mr. Kitley; 2, Mr. J. Cooke. SALADS: 1, Mr. J. Cooke; 2, Mr. Cooper. Numerous Cottagers' Prizes were also given. EXTRA PRIZES: *Dahlia (Seedling*, 1842*)*, Mr. Drummond. *Cut Flowers*, Mr. Coles. *German Asters*, Mr. Wheeler. *Collection of Annuals*, Mr. Kitley, jun. *Dahlias*, Mr. Sealey. *Device of Flowers*, Mr. G. Shaw. *Campánula pyramidalis*, Mr. Kitley. *Pentstemon gentianoides coccinea*, Mr. Kitley. *Basket of Plants*, Miss Bayly. *Greenhouse Plants*, J. M. Yeeles, Esq. *Stove Plant*, J. M. Yeeles, Esq. *Heaths*, J. M. Yeeles, Esq. *Device of Flowers*, Miss Whitehead. *Basket of Cut Flowers*, Mr. Pyatt; *do.*, Rev. J. Bond. *Amaryllis (new species)*, Mr. G. Shaw. *Fuchsia*, Miss Bayly. *Pine (Sugar-loaf)*, Mr. Spencer, gr. to the Marquess of Lansdowne. *Grapes (growing in a pot)*, Miss Bayly. *Plums*, W. Miles, Esq., M.P. *Apples*, T. Chivers.

Battle and Hastings Horticultural Society, Sept. 15.—The seventeenth show of this society took place in the Assembly Rooms, at the George Inn:—PREMIUMS OF THE FIRST CLASS were awarded to Lady Webster, for the *best perennials, French Beans, Carrots*, and *Cabbages; 2d best stove plant, Black Grapes of artificial growth, White ditto*, and *Pears*. Mr. Ogle, gr. to A. E. Fuller, Esq., M.P., for the *best design, stove plant, Black Grapes of artificial growth, White ditto, Nectarines, and Figs; 2d best Peaches, and an extra prize for hardy plant.* Mr. Buffard, gr. to Sir W. Ashburnham, Bart., for the 2*d best Asters, Biennials, and Plums.* T. Frewen, Esq., for the *best Filberts and Grapes grown in the open air; 2d best Dahlias, Figs, and Dessert Apples.* The Rev. B. Cole, for the *best annuals.* The Ven. Archdeacon Hare, for the *best Melon and Plums; 2d best Stocks, Cucumbers, and Potatoes.* H. G. M. Wagner, Esq., for the 2*d best Nectarines.* T. Smith, Esq., for the *best Kitchen Apples.* Mr. M'Vean, gr. to Sir C. M. Lamb, Bart., for the *best bouquet.* Mr. Weston, gr. to Mrs. Milward, for the 3*d best Pears.* Mr. Walter, gr. to W. Hart, Esq., for the *best Cucumbers.* Mr. Miller, for the *best Dahlias, Asters, and Potatoes;* and 2*d best annuals.* Mr. Denyer, for the *best Stocks, hardy plant, and Dessert Apples; 2d best Melon, Kitchen Apples, Filberts, French Beans, Turnips, and Cabbages*, and an *extra prize for a collection of fruit.* Mr. Tyrell, for the *best Pears.* Mr. J. Knight, for the *best Peaches, new plant, and Turnips; 2d best Carrots; 3d best Dahlias;* and an *extra prize for a collection of vegetables.* Mr. B. W. Knight, for the *best seedling plant.* THE SWEEPSTAKES FOR DAHLIAS were awarded 1st to Mr. R. White; 2d, to Mr. W. Dawes; and 3d, to Mr. M'Vean. AMATEURS' CLASS:—Mr. W. Dawes, for the *best Design and Kitchen Apples; 2d best Dahlias, Black Grapes artificially grown, White ditto, and Filberts.* Mr. J. Smith, for the *best Melon and Cucumbers; 2d best Potatoes; 3d best Dahlias;* and an *extra prize for Celery.* Miss Daws, for the 2*d best Asters and biennials.* Miss Humphrey, for the *best biennials and greenhouse plant;* and 2*d best annuals.* Mrs. Miller, for the *best Dahlias, Asters, and annuals.* Mr. Kenward, for the *best Black Grapes artificially grown, White ditto, and 2d best Melon.* Miss Watts, for the *best Grapes grown in the open air.* Mr. J. Simes, for the *best Peaches, Dessert Apples, and Filberts;* and 2*d best Plums.* Mrs. Heartness, for the 3*d best Pears.* Mr. J. Burgess, for the *best Nectarines*, and 2*d best Peaches.* The Dean of Battle, for the *best Figs and Pears.* Lieut.-Col. Elliot, for the 2*d best Dessert Apples and Cucumbers.* Lieut.-Col. Williams, for the *best Potatoes.* Mr. W. Metcalf, for the *best Plums.* Mr. W. White, for the *best Peas, French Beans, Turnips, and Cabbages; 2d best Kitchen Apples, Pears, and Carrots.* Mr. R. White, for the *best Carrots.* Numerous Cottagers' Prizes were also given.—*Sussex Express.*

Beverley Horticultural Society, Sept. 7.—The last show took place in the new public room, Norwood, Beverley; where the following prizes were awarded: PLANTS AND FLOWERS—STOVE PLANT. 1 and 3, Rev. C. Hotham; 2, R. F. Shawe, Esq. GREENHOUSE PLANT: 1, Rev. C. Hotham; 2, R. F. Shawe, Esq.; 3, E. H. Reynard, Esq. ERICAS, 1 and 2, R. F. Shawe, Esq. FUCHSIAS, 1, J. R. Pease, Esq.; 2, R. F. Shawe, Esq.; 3, Col. Martin. CHINA ROSE, *in pot*, 1, Rev. C. Hotham; 2 and 3, R. F. Shawe, Esq. HARDY HERBACEOUS PLANT, 1, Mr. G. Escritt: 2, Rev. C. Hotham; 3, Col. Martin. CALCEOLARIA, *Herbaceous*, 1, E. H. Reynard, Esq.; 2 and 3, Sir T. A. C. Constable. *Shrubby*, 1, J. R. Pease, Esq. STOVE CREEPER, 1, E. H. Reynard, Esq.; 2, J. R. Pease, Esq.; 3, Col. Martin. *Greenhouse do.*, 1, E. H. Reynard, Esq.; 2, J. R. Pease, Esq. PELARGONIUMS, 1, and 2, Rev. L. E. Thoroton; 3, A. Terry, Esq. COLLECTION OF ROSES, 1 and 2, Rev. B. Hotham. CHINA ASTERS, 1, James Hall, Esq.; 2, D. Burton, Esq.; 3, Rev. C. Hotham. FRENCH MARYGOLDS, *Ranunculus-flowered*, 1 and 2, Sir T. A. C. Constable; 3, D. Burton, Esq. *Striped*, 1 and 2, Sir T. A. C. Constable; 3, Rev. L. Dennis. AFRICAN MARYGOLD, *Orange*, 1, Rev. L. Dennis; 2, Mr. G. Escritt; 3, Rev. C. Hotham. *Lemon*, 1, 2, and 3, Rev. C. Hotham. HOLLYHOCKS, 1, Major Hutton; 2, Rev. L. Dennis; 3, J. Grimstone, Esq. BALSAMS, 1, 2, and 3, E. H. Reynard, Esq. COCKSCOMBS, 1, 2, and 3, A. Bosville, Esq. BOUQUETS, *Exotic*, 1, F. Watt, jun., Esq.; 2, E. H. Reynard, Esq. *Hardy*, 1, J. Hall, Esq. *Exotic and Hardy*, 1 and 2, R. F. Shawe, Esq. BASKET OF CUT FLOWERS, 1, J. Grimstone, Esq. DAHLIAS, *white*, 1, Rev. L. E. Thoroton; 2, A. Terry, Esq. *Pink or Rose*, 1, Rev. C. Hotham; 2, A. Terry, Esq. *Dark or Maroon*, 1, Rev. F. Best; 2, Rev. E. W. Stillingfleet. *Yellow*, 1 and 2, A. Terry, Esq. *Primrose*, 1 and 2, Rev. E. W. Stillingfleet. *Dark Crimson*, 1 and 2, Rev. C. Hotham. *Light Crimson*, 1, Rev. L. E. Thoroton; 2, F. Watt, Esq. *Dark Purple*, 1, Rev. L. Thoroton; 2, Rev. E. W. Stillingfleet. *Light Purple*, 1, A. Terry, Esq.; 2, R. F. Shawe, Esq. *Scarlet*, 1, Rev. F. Best; 2, Hon. C. Langdale. *Ruby*, Col. Martin. *Salmon and Buff*, 1, A. Terry, Esq.; 2, Rev. F. Best. *Dark-tipped*, 1, J. Grimston, Esq.; 2, Rev. C. Hotham. *Light-tipped*, 1 and 2, A. Terry, Esq. *Dark-laced*, 1, Rev. F. Best; 2, Rev. L. E. Thoroton. *Dark Lilac*, 1, Rev. L. E. Thoroton; 2, Rev. L. Dennis. *Light Lilac*, 1 and 2, A. Terry, Esq. *Pan of six varieties*, Rev. C. Hotham. *Pan of* 12, 1, Rev. F. Best; 2, R. F. Shawe, Esq.; 3, Rev. E. W. Stillingfleet. *Seedling of* 1841, *or* 1842, Mr. J. Edwards, York. EXTRA PRIZES. —For *China Asters*, J. Hall, Esq. *Collection of Ericas*, R. L. Shawe, Esq. *Collection of Greenhouse Plants*, divided between R. F. Shawe. Esq., and Col. Martin. *Designs of Cut Flowers*, 1, S. H. Egginton, Esq.; 2, R. F. Shawe, Esq. *Pans of* 18 *varieties of Dahlia*, 1, Rev. E. L. Thoroton; 2, Rev. F. Best. *Pans of* 24, 1, Rev. F. Best; 2, Mr. J. Edwards, York. *Three sorts of fruit*, 1, R. F. Shawe, Esq.; 2, Col. Martin. FRUIT—PINE APPLE, 1 and 2, R. F. Shawe, Esq.; 3, J. R. Pease, Esq. GRAPES, *Black*, 1, S. H. Egginton, Esq.; 2, E. H. Reynard, Esq.; 3, F. Wilkinson, Esq. *White*, 1, Mrs. Walker; 2, F. Wilkinson, Esq.; 3, Col. Martin. MELONS, *for size*, 1, R. F. Shawe, Esq.; 2, J. Grimstone, Esq.; 3, S. H. Egginton, Esq. *For flavour*, 1, S. H. Egginton Esq.; 2, E. H. Reynard, Esq.; 3, Sir T. A. C. Constable. PEACHES, 1, J. Grimstone, Esq.; 2, E. H. Reynard, Esq.; 3, J. Hudson, Esq. NECTARINES, 1 and 2, J. Grimstone, Esq.; 3, Col. Martin. FIGS, 1, R. F. Shawe, Esq.; 2, Col. Martin. APRICOTS, 1, J. Hudson, Esq.; 2 and 3, J. Grimstone, Esq. PLUMS, 1, Hon. C. Langdale; 2, R. F. Shawe, Esq.; 3, Mr. W. Whiting. DAMSONS, 1, H. Hutton, Esq.; 2, Sir T. A. C. Constable; 3, Hon. C. Langdale. PLUMS. *Wine-sour*, 1 and 2, J. Grimstone, Esq.; 3, Hon. C. Langdale. *Greengage*, 1 and 2, J. Grimstone, Esq.; 3, Rev. E. W. Stillingfleet. CHERRIES, *Morello*, 1, A. Bosville, Esq.; 2, E. H. Reynard, Esq.; 3, Rev. C. Hotham. APPLES, *Dessert*, 1, R. F. Shawe, Esq.; 2, J. Grimstone, Esq.; 3, A. Bosville, Esq. *Baking*, 1, Mr. W. Anderson; 2, F. Wilkinson, Esq.; 3, H. W. Maister, Esq. PEARS, *Dessert*, 1 and 3, J. Grimstone, Esq.; 2, Rev. C. Hotham. *Baking*, 1, Rev. E. W. Stillingfleet; 2, S. H. Egginton, Esq.; 3, A. Terry, Esq. GOOSEBERRIES, 1, J. Grimstone, Esq.; 2, H. Woodall, Esq.; 3, F. Wilkson, Esq. CURRANTS, *Red*, 1, Mrs. Walker; 2, J. Grimstone, Esq.; 3, F. Wilkinson, Esq. *White*, 1 and 3, J. J. Grimstone, Esq.; 2, D. Burton, Esq. Langdale; 3, Sir W. Pennyman. BEET, 1 and 3, F. Watt, Esq.; 2, R. F. Shawe, Esq. Prizes were also awarded for Cottagers' productions.—*Hull Packet.*

Botanical and Horticultural Society of Newcastle-upon-Tyne, Sept. 26.—The botanical and horticultural society for the counties of Durham, Northumberland, and Newcastle-upon-Tyne, held its last exhibition for the season, in the Music Hall, Newcastle-upon-Tyne, on Monday last. It was more numerously attended than any of the Society's exhibitions this year, excepting the great show in June, and the spectators were, in general, much gratified with the specimens of fruits and flowers that were produced. The prizes given were confined principally to Dahlias, the choicer hardy fruits, and exotic plants. The display of Dahlias was limited, owing to the tempestuous rains on the two previous days, which destroyed many flowers intended for exhibition; such as were fortunate enough to escape injury from the wet were shown in the finest possible condition. Two blooms of Princess Royal from Mr. Cook, gr. to E. Collingwood, Esq., were said to be the best flowers in the room, and attracted a large share of the attention of the visitors. There were also two blooms of a seedling Dahlia, named Miss Cecil, raised by Mr. Cook, which for form, delicacy of colour, and the exquisite richness of its purple tip, is equal to any variety now in cultivation. On the table were good specimens of Lobélia ígnea, from Mr. Deans, gr. to Miss Cuthbert; L. propinqua, from Mr. Hedley, gr. to Sir J. Trevelyan, Bart.; and L. fulgens from Mr. Clark, gr. to Mrs. Bewicke. Mrs. Surtees exhibited three fine Fuchsias; Mr. Hedley, Amaryllis vittata and Róchea obliqua; Mr. Deans, Justícia purpúrea; Mr. Cook, Achimenes coccínea; and M. W. Dunn, Esq., Gesnera Cooperi. Cockscombs were shown by Mr. Charlton, gr. to C. Allhusen, Esq., by Mr. Cook, Mr. Clark, and others. The Capsicums, from Mr. Strother, gr. to J. Johnson, Esq.; Mr. Reid, gr. to Wm. Losh, Esq.; Mr. Clark; and Mrs. Surtees, were uncommonly fine. Geo. Wailes, Esq., secretary to the society, exhibited, but not for competition, a fine plant of Catasetum tridentatum in full flower, and a strong raceme of the curious blossoms of the Gongora atropurpúrea, which were admired by all. There were two noble bouquets of cut flowers, one of which, from Mr. Charlton, gr. to Mrs. Atkinson, was composed of almost every variety of summer and autumnal flowers. The bouquets of Dahlias by Mr. Watson and Mr. Cook were large and splendid, the latter being composed altogether of choice blooms. Specimens of Hollyhocks were produced by Mr. Clark and Mr. Strother. The Russian Stocks of Mr. G. Cook were very fine for the season, as were also those from Mr. Strother, but the end of September is far too late in the year for a prize to be offered for these delicious flowers. There were only two devices of Dahlias, a suspension chain bridge, by Mr. Moderill, and a lion rampant, by Mr. Watson; both of which were ingenious, and displayed considerable taste in execution. Mr. Charlton, nurseryman, sent an extensive and beautiful variety of Dahlia blooms, which were not exhibited for competition, but which were greatly admired. The fruits shown were remarkably fine; a Pine (New Providence), sent by Mr. Hall, weighed nearly 6lbs.; large and fine ones were also shown by Mr. Kelly, and Mr. Dale, gr. to W. Russell, Esq. Grapes were exhibited by Mr. Cook, Mr. Strother, Mr. Hedley, Mr. Reid, Mr. Wallis, Mr. Foreman, Mr. Charlton, Mr. G. Cook, and Mr. Scott. Several good dishes of young Peas were also on the table, remarkable at this season of the year; and also some Onions of great size, from the gardens of Mr. James and Mr. Allhusen; the gardener of the latter gentleman also produced a capital Cucumber (Eggleston), which measured in length 22 inches. The judges awarded the prizes as follows:—FRUITS—PINE APPLE (New Providence), the silver medal to Mr. W. Hall, gr., Gosforth. APPLES, *Dessert*, the bronze medal to Mr. G. Dale, gr. to W. Russell, Esq. PEARS, 2d silver medal to Mr. Scott, gr. to H. Lamb, Esq. GRAPES, (Muscat, Muscadine, Grizzly and Black Frontignan, Muscat of Alexandria, New Muscat of Ryton and Black Hamburgh,) 2d silver medal to Mr. J. Cook, gr. to E. Collingwood, Esq. PEAS, the bronze medal to Mr. Charlton, gr. to Mrs. Atkinson. CAPSICUMS, 2d bronze medal to Mr. Reid, gr. to W. Losh, Esq. DAHLIAS, *tipped*, 1, (Phenomenon), 2d silver medal to Mr. Cook. 2, (Bridesmaid), the bronze medal to Mr. J. Chaplin; *Apples*, Miss Laxton; *Bouquet*, Mr. Phillips; *Green-house Plants*, Mr. Phillips; *Cotyledon*, Mrs. Thompson. Numerous Cottagers' Prizes were awarded for Flowers, Fruits, Vegetables and Honey.

St. Andrew's Horticultural Society, Fifeshire, Sept. 21.—The last meeting for the season took place in the Town-hall, upon which occasion an excellent address was delivered by Dr. Cook—we are sorry that, from want of space, we can only give the following extract:—"The formation of horticultural societies, such as that of which we are members, cannot be too highly appreciated. They have given a decided stimulus to activity and to invention—they have diffused amongst the cultivators of gardens a laudable and honourable emulation—they are the means of bringing together intelligent and enlightened men of the same profession, or attached to the same pursuits, and their conversation and mutual intercourse suggest improvements, or lead to discoveries, which else would never have been made. The benefits resulting from the societies to which I refer are, it is pleasant to see, more and more extensively discerned and prized. The transactions and the exhibitions of numbers of them established in all parts of the country are detailed in our different newspapers; and what is thus made known has a most beneficial effect even upon districts into which such institutions have not been introduced. Suffer me, gentlemen, still to add a few remarks, which may place clearly before you a peculiar and very important view of the good which has been effected in a surprising degree from employing ingenuity and exertion in horticultural cultivation. We are indebted to the beneficence of Providence for the roots, the vegetables, and the fruits which multiply the means of subsistence, or add to the comfort and gratification of all classes of the community. But almost the whole of these gifts of nature may be essentially improved by the labour and the skill of man under the most delicious climates, and where there exists the most fertile and luxuriant soil this is in no small degree the case; and much more does it hold true as to less favoured, or even to temperate regions. Without steady and well-directed interposition the productions of our gardens, even supposing that gardens were not wholly abolished, would rapidly degenerate, and the introduction of the products of other and milder skies would be rendered impracticable. Addison, in one of the most interesting papers of the "Spectator," has so beautifully and strikingly stated what I am now mentioning, applying what he says to England—and it is at least equally applicable to Scotland—that I cannot refrain from quoting the passage:—"If we consider our own country in its natural prospect, what a barren and uncomfortable spot of earth falls to our share! Natural historians tell us that no fruit grows originally among us besides Hips and Haws, Acorns and Pignuts, with other delicacies of the like nature; that our climate of itself, and without the assistance of art, can make no farther advances towards a Plum than a Sloe, and carries our Apple to no greater perfection than a Crab; that our Melons, our Peaches, our Figs, our Apricots, and Cherries, are strangers amongst us, imported in different ages, and naturalised in our English gardens; and that they would all degenerate and fall away into the trash of our own country if they were wholly neglected by the planter, and left to the mercy of our sun and soil." But we must look to gardening in a higher light than as merely ministering to the supply of our bodily wants and enjoyments. It unfolds beauties in the natural world which the eye of man would never else have contemplated, contributing alike to the refinement of taste, and to the purest pleasure. It is impossible to enter the splendid and finely-kept greenhouses which now abound throughout Britain, or even to survey the chaste or the gorgeous beds which many of our common gardens present to us, without being astonished at the richness and the loveliness which they display—without admiring the immense variety of our flowers—without being struck by the manifestation of wisdom and benevolent design which they place before us; and, when we are inclined seriously to meditate upon them, without feelings and emotions of piety and of gratitude to that omnipotent Being, who has enabled his intelligent creatures to collect and to concentrate the splendours scattered around them, and, in the expressive language of inspiration, to make even the wilderness blossom as the rose. All this, gentlemen, shows the unspeakable value of the art or of the science to which you are attached, and should stimulate you to perseverance in your efforts still further to extend it. There is in the reflection that the business of a man's life is interwoven with the improvement and the enjoyment of his fellow-creatures, something which calls forth all his energies, which opens sources of perpetual satisfaction, and which prevents him from being disheartened by the vexations and disappointments from which, even in prosecuting that business, he cannot hope in this mingled state to be wholly exempted. And you can scarcely fail to be animated by the hope that, in carrying on your labours, you may make discoveries which will raise your own reputation and prove a blessing to your fellow-creatures. Combining, as I trust you will ever do, with your most useful and often most elegant occupation, a scrupulous regard to the duties and the virtues, which, as moral and religious beings, we should all severally esteem, and without which there can be no real dignity of character, you will have the comfort of thinking that you are valuable and exemplary members of society, and you will find your reward in the respect and esteem of those who are acquainted with your exertions, and who have derived benefit from them." Prizes were awarded as follows:—GARDENERS: to J. Goodall, gr., Balchrystie, for *best single Dahlia*, 24 *Dahlias*, *Apricots*, *Plums*, and *Celery*. J. Easson, gr., Kirkmay, for *best Pentstemons*, *Lobélias*, *Picotees*, *Perennials*, *Onions*, *Red Cabbage*, and *Swedish Turnip*. J. Hardy, gr., West Park, for *best Cucumbers* and *late Cabbage*. A. Poustie, gr., Gilston, for *best bunch of black Hamburgh Grapes*, *Muscat Grapes*, *Pears*, *Gooseberries*, *Cauliflowers*, *Carnations*, and *Calceolárias*. Mr. A. Scott, gr., Lathallan, for *best* 12 *Self-coloured Dahlias*, 6 *Variegated Dahlias*, *Fúchsias*, *Stocks*, *Asters*, *Phloxes*, *Sálvias*, *Petúnias*, *largest Grapes*, *Green-flesh Melon*, *Red Currants*, *Savoy*, and *Beet*. Mr. W. Smith, gr., Priory, for *best bunch of Frontignan* and *Muscadine Grapes*. *Jargonelle Pears*, *Pelargóniums from the open garden*, *Fúchsia fulgens*, *Hollyhocks*, and *Carrots*. Mr. W. Connacher, gr., St. Fort, for *best Gladioli*, *Oxalis*, *Hardy Annuals*, *largest bunch of Grapes* (*Lombardy*), *Scarlet-flesh Melon*, *Wall Peaches*, *Peaches under glass*, *Nectarines*, 3 *kinds of Wall Apples*, 3 *kinds of Standard Apples*, *Vegetable Marrow*, *largest Gourd*, and *German Green*. AMATEURS—Mr. G. Cruickshank, St. Andrew's, for *best Dahlia of any kind*, 4 *Self-coloured Dahlias*, 4 *Variegated Dahlias*, *Salvias*, *Fúchsias*, *Hollyhocks*, *Beurré Pears*, *Apples*, *Onions*, and *Swedish Turnip*. Dr. Cook, St. Andrew's, for *best* 4 *Jargonelle Pears*, and *Double Stocks*. Mrs. Berwick, St. Andrew's, for *best late Cabbage*, *Savoy*, and *German Green*. Alex. Meldrum, Esq., Bloomhill, for *best Carrots* and *Lettuces*. Sir D. Brewster, St. Andrew's, 2*d best Jargonelle Pears*. Mr. J. Thomson, St. Andrew's, 2*d best* 4 *Variegated Dahlias*, *Stocks*, *Hollyeocks*, and *Onions*. Mr. B. Gibson, St. Andrew's, 2d for *Fúchsias*. Mr. J. Gibson, Woodburne, 2d for *Carrots*. Hornby, Esq.; 2, C. Swainson, Jun., Esq.; 3, 4, and 5, C. Swainson, Esq.; 6, C. Swainson, Jun., Esq. STOVE PLANTS: 1, W. Calrow, Esq.; 2 and 3, Rev. R. Hornby. GREENHOUSE PLANTS: 1, C. Swainson, Esq.; 2, Rev. R. Hornby; 3, C. Swainson, Esq.; 4, 5, and 6, Rev. R. Hornby. HARDY HERBACEOUS: 1, H. Hornby, Esq.; 2, Mrs. Cross; 3, C. Swainson, Esq. ANNUALS: *Tender*, 1, C. Swainson, Esq.; 2, W. Calrow, Esq.; 3, Mrs. Cross. *Hardy*, 1, Mrs. Cross; 2 and 3, C. Swainson, Jun., Esq. FRUIT AND VEGETABLES: H. Hornby, Esq., *Black Grapes* and *White Muscat do.*; C. Swainson, Jun., Esq., *best dish of Peaches*; G. Jackson, Esq., *Dessert Apples*; Mr. R. Mansley, *Kitchen Apples*, *Pears*, and *Plums*; Rev. R. Hornby, *Melon*; C. Swainson, Jun., Esq., *second Melon*; H. Hornby, Esq., *Cucumbers* and *Cauliflowers*; Mr. W. Dent, *Cab-*

bages (*Red*); C. Swainson, Jun., Esq., *Turnips* and *Celery*; H. Hornby, Esq., *Rhubarb* and *Carrots*; Mr. E. Knight, *Onions*; H. Hornby, Esq., *Potatoes*.—*Preston Chronicle.*

Warwick Horticultural Society, Sept. 14.—This meeting was held at the County Hall. Mr. B. Law, of Long Itchington, exhibited (not for competition) sixteen cucumbers, cut from three plants—"Walker's Improved"—the average length of each being 19½ inches. From the same three plants, on Monday fortnight, he cut 26 cucumbers, of the average length of 19 inches, all being perfectly green and fit for the table. These productions, by out-door cultivation of a tender plant, may be considered extraordinary. The following is a list of the prizes awarded:—Plants and Flowers: Dahlias, *stand of* 24: 1, Adams's Prince Albert, Beauty of Wakefield, Maid of Bath, Rouge et Noire, Tournament, Danecroft Rival, Fanny Keynes, Girling's Prince of Wales, Dodd's ditto, Pickwick, Catleugh's Eclipse, Hope, Lewisham Rival, Nicholas Nickleby, Maria, President of the West, Argo, Andrew Hofer, Rienzi, Indispensable, Bridesmaid, Widnall's Eclipse, and two Seedlings—Mr. Earl, Birmingham; 2, Duchess of Richmond, Phenomenon, President of the West, Widnall's Queen, Eva, Admirable, Conductor, Grace Darling, Unique, Sussex Rival, Nicholas Nickleby, Beauty of the Plain, Rienzi, Pickwick, Pamplin's Bloomsbury, Maria, Pamplin's Charles the Twelfth, Grande Baudine, Lady Middleton, Indispensable, Climax, Fanny Keynes, and two Seedlings—Mr. C. Kimberley; 3, Mr. Perkins. *Stand of* 12: 1, Duke of Conwall, Rouge et Noire, Phenomenon, Conservative, Dodd's Prince of Wales, Indispensable, Beauty of the Plain, Conductor, Grace Darling, Burnham Hero, and two others—Mr. J. Burbury; 2, Mr. Harris; 3, Mr. Earl. *Stand of* 6: 1, President of the West, Admirable, Rouge et Noire, Phenomenon, Maria, and Grace Darling—Mr. C. Kimberley; 2, Mr. Earl; *Seedling*, Mr. Earl. Stove Plants, *amateurs*, 1, W. H. Bracebridge, Esq.; 2, W. H. Bracebridge, Esq. Specimen Plant, W. H. Bracebridge, Esq. Greenhouse Plants, 1, W. H. Bracebridge, Esq.; 2, H. Bradley, Esq.; Ditto, *nurserymen*, 1, Mr. Barnes; *best six ditto, amateurs*, 1, W. H. Bracebridge, Esq.; 2, H. Bradley, Esq. Pelargoniums, *twelve* (*amateurs*), W. H. Bracebridge, Esq.; *six*, 1, H. Bradley, Esq.; 2, Earl of Warwick. Cockscombs, 1, Mr. Carpenter, 2, W. H. Bracebridge, Esq. Annuals, 1, W. H. Bracebridge, Esq. Herbaceous Plants, Mr. Brownridge. Cut Flowers, Mr. Barnes. Asters, 1, H. C. Wise, Esq.; 2, C. T. Warde, Esq. Ditto, *twelve*, C. T. Warde, Esq.; Pansies, Mr. J. Burbury. Miscellaneous Plants, 1, Mr. Barnes, 2, Mr. Brownridge. Design of Cut Flowers, Mr. Brownridge. Fruits—Pines, 1 and 2, Earl of Warwick. Melons, 1, Rev. H. Wise; 2, W. Holbech, Esq. Grapes, *Black*, 1, H. Bradley, Esq.; 2, W. C. Russell, Esq.; *White*, 1, W. C. Russell, Esq.; 2, H. Bradley, Esq.; *Out-door ditto*, W. Holbech, Esq. Figs, W. H. Bracebridge, Esq. Peaches, 1 and 2, W. Holbech, Esq. Nectarines, 1, C. T. Warde, Esq.; 2, W. Holbech, Esq. Plums, W. Holbech, Esq. Cherries, H. Bradley, Esq. Apples, *Dessert*, 1 and 2, W. H. Bracebridge, Esq.; *Culinary*, 1 and 2, C. T. Warde, Esq. Pears, 1, Mr. Smith; 2, Mr. Carpenter. Miscellaneous Fruits, C. T. Warde, Esq. Vegetables—Carrots, 1, Mr. Cattell; 2, Mr. T. Smith; Parsneps, ditto. Turnips, J. Fullerton, Esq. Onions, 1, Mr. T. Smith; 2, Mr. T. Carpenter. Endive, W. H. Bracebridge, Esq. Celery, 1, Mr. T. Smith; 2, W. H. Bracebridge, Esq. Vegetable Marrows, W. Collins, Esq., M.P., Cucumbers, *Frame*, Mr. Barnes. Horse Radish, Mr. Smith. Extra Prizes—*Specimen Stove-plant*, W. H. Bracebridge, Esq. *Ferns*, H. Bradley, Esq.; *single specimen*, H. Bradley, Esq. *Basket of Miscellaneous Plants*, W. H. Bracebridge, Esq. *Herbaceous Flowers*, Mr. Brownridge. *Peas*, J. Fullerton, Esq. *Beet*, Mr. Carpenter. *Filberts*, Rev. J. Lynes. China Asters, 1, Mr. Catanach; 2, Mr. Ferguson; 3, Mr. Durword. Marygold, 1, Mr. Catanach; 2, Mr. Ferguson; 3, Mr. Durword. Phlox, 1, Mr. Durword; 2, Mr. Ferguson; 3, Mr. Catanach. Larkspur, 1, Mr. Ferguson; 2, Mr. Durword. Antirrhinum, 1, Mr. Durword; 2, Mr. Catanach; 3, Mr. Wallace. Herbaceous Plants, 1, Mr. Catanach; 2, Mr. Durword; 3, Mr. Ferguson. Fruits—Plums, *Greengage*, 1, Mr. Catanach; 2, Mr. Durwood; 3, Mr. Wallace. *White Magnum*, 1, Mr. Ferguson, 2, Mr. Wallace; 3, Mr. Catanach. *Any other sort*, 1, Mr. Ferguson; 2, Mr. Durword; 3, Mr. Catanach. Apricots, 1, Mr. Catanach; 2, Mr. Durword. Apples, *Dessert*, 1, Mr. Durword; 2, Mr. Catanach; 3, Mr. Ferguson. *Kitchen*, 1, Mr. Wallace; 2, Mr. Ferguson; 3, Mr. Durword. Pears, *Jargonelle*, 1, Mr. Durword; 2, Mr. Catanach; 3, Mr. Wallace. *Any other sort*, 1, Mr. Catanach; 2, Mr. Wallace; 3, Mr. Durword. Cherries, *Morello*, 1, Mr. Catanach; 2, Mr. Durword; 3, Mr. Ferguson. *Any other sort named*, 1, Mr. Durword; 2, Mr. Catanach. Gooseberries, *Red*, 1, Mr. Catanach; 2, Mr. Ferguson; 3, Mr. Wallace. *Green*, 1, Mr. Ferguson; 2, Mr. Wallace. *Yellow*, 1, Mr. Catanach; 2, Mr. Durword; 3, Mr. Ferguson. Currants, *Red*, 1, Mr. Ferguson; 2, Mr. Durward; 3, Mr. Catanach; *White*, 1, Mr. Ferguson; 2, Mr. Durword; 3, Mr. Wallace. Gourds, *largest*, 1, Mr. Catanach; 2, Mr. Durword. *Ornamental*, 1, Mr. Catanach; 2, Mr. Durword. Melon, 1, Mr. Catanach; 2, Mr. Ferguson. Vegetables—Cabbage, 1, Mr. Durword; 2, Mr. Catanach; 3, Mr. Ferguson. Savoys, 1, Mr. Catanach; 2, Mr. Durword; 3, Mr. Ferguson. Red Cabbage, 1, Mr. Ferguson; 2, Mr. Catanach; 3, Mr. Durword. Cauliflower, 1, Mr. Ferguson; 2, Mr. Catanach. Celery, 1, Mr. Durword; 2, Mr. Catanach; 3, Mr. Ferguson. Onions, 1, Mr. Durword; 2, Mr. Ferguson; 3, Mr. Wallace. Carrots, 1, Mr. Durword; 2, Mr. Ferguson; 3, Mr. Wallace. Beet, 1, Mr. Durword; 2, Mr. Wallace; 3, Mr. Catanach.—*Perthshire Advertiser.*

West Renfrewshire Horticultural Society, Sept. 21.—The last meeting for the season was held in the large hall of the Buck's Head Tavern, when upwards of one hundred and twenty articles were entered for competition. The following prizes were awarded:—Double Dahlias, *best* 12 *Selfs*, 1, Mr. T. Robertson; 2, Mr. J. Baillie; 3, W. Gilmour, Esq. *Best* 12 *Striped or Shaded*, 1, Mr. M. Service, gr. to A. Ferrie, Esq.; 2, Mr. B. Bulloch, gr. to Mrs. Crooks; 3, Mr. J. Baillie. *Best* 9, 1, Mr. J. Bulloch; 2, Mr. J. Baillie; 3, Mr. P. M'Inroy, gr. to Mrs. M'Inroy. *Best* 3 *Seedlings*, 1, Mr. T. Robertson; 2, Mr. Gilmour; 3, Mr. M. Service. Best 12 Seedling Pansies, 1, Mr. Service; 2, Mr. Gilmour. China Asters, 1, Mr. J. Galloway, gr. to Miss Watt; 2, Mr. J. Stevenson, gr. to G. J. Eccles, Esq.; 3, Mr. D. Gray. Tender Annuals, Mr. Service. Verbenas, 1, Mr. D. M'Coll, gr. to J. Scott, Esq.; 2, Mr. Service. Stocks, Mr. Service. Hardy Annuals, 1, Mr. J. Borthwick; 2, Mr. J. Stevenson; 3, Mr. J. Galloway. Marygolds, 1, Mr. J. Galloway; 2, Mr. J. Bulloch; 3, Mr. J. Stevenson. Grapes, 1, Mr. D. Livingston, gr. to C. Scott, Esq.; 2, Mr. D. M'Coll; 3, Mr. J. Stevenson. Pears, 1, P. Montgomery, Esq.; 2, Mr. J. Abercromby, gr. to Arch. Baine, Esq.; 3, Mr. Service. Apples, 1, Mr. D. Livingston; 2, Mr. J. Abercromby; 3, Mr. P. Montgomery. Plums, 1, Mr. P. Montgomery; 2, Mr. J. Barr; 3, Mr. J. Stevenson. Onions, 1, Mr. D. Goldie, gr. to the Earl of Glasgow; 2, Mr. J. Abercromby; 3, Mr. Service. Carrots, 1, Mr. E. M'Ellar; 2, Mr. J. Bulloch; 3, Mr. R. Jamieson. Celery, 1, Mr. Service: 2, Mr. Bulloch; 3, Mr. J. Galloway. Best 9 Vegetables, 1, Mr. D. M'Coll; 2, Mr. J. Bulloch; 3, Mr. J. Baillie. *Best* 6 *Vegetables* (*Market Gardeners*), 1, Mr. E. M'Ellar; 2, Mr. Borthwick; 3, Mr. R. Jameson. Potatoes, 1, Mr. D. Gray; 2, Mr. E. M'Ellar: 3, Mr. P. M'Inroy. Bouquet, 1, Mr. J. Barr; 2. Mr. Service. Device of Hardy and Semi-Hardy Flowers, 1, Mr. J. Galloway; 2, Mr. D. M'Coll. Melon, 1, Mr. Service; 2, Mr. J. Abercromby; 3, Mr. D. Livingston. Extra Premiums were recommended by the judges to P. Montgomery, Esq., for a *Basket of Fruit*; and to Mr. D. Goldie, for *Onions*, equal in size and appearance to those imported from Flanders; and to Mr. M. Service.—*Greenock Observer.*

Wisbeach Horticultural Society, Sept. 14.—This exhibition was held in the Exchange Hall, where the following prizes were awarded: Silver Cup, value 5*l*., for best 24 Dahlias, 1, Mr. Widnall, for Widnall's Conductor, Eclipse, Majestic, Queen, Hudson's Princess Royal, Stella, Suffolk Hero, Tournament, Andrew Hofer, Catleugh's Eclipse, Egyptian Prince, Metella, Duchess of Richmond, Royal Standard, Sir Frederick Johnstone, Admirable, Dodd's Prince of Wales, Indispensable, Dowager Lady Cooper, Maria, Regina, Phenomenon, Charles XII, Ansell's Unique; 2, C. Hunter, Esq., *for best* 12, Argo, Egyptian Prince, Wakefield Beauty, Suffolk Hero, Phenomenon, Lady Cooper, Optima, Grace Darling, Bloomsbury, Prince of Wales, Amato, Maria. Grapes, W. Peckover, Esq. Melon, Mr. R. Freestone. Peaches, do. Nectarines, do. Plums, Mr. Cockett. Gooseberries, Mr. P. Ward. Apples, *Dessert*, 1, Mr. Thirkel; 2, Mr. R. Freestone. *Sauce*, 1, Mr. Taylor; 2, Mr. P. Ward. Pears, 1, do.; 2, Mr. Cockett. Red Currants, Mr. P. Ward. Filberts, Mr. Bodger. Exotic in flower, W. Peckover, Esq. Collection of Plants, Mr. Balding. Cockscomb,—Watson, Esq. Balsams, W. Peckover, Esq. China Asters, Rev. W. G. Townley. Hollyhocks, Mrs. Wainman. Dahlia, Mr. R. Freestone. *Ditto*, C. Hunter, Esq. Hardy Herbaceous Plant, W. Peckover, Esq. Fuschia, H. Jackson, Esq. Onions, Mr. C. Sharp. Carrots, Mr. P. Ward. Turnips, do. Garden Beans, Mr. Thirkel. Marrow-fat Peas, Mr. P. Ward. French Beans, Parsneps, Celery, Carrots and Turnips, Mr. Thirkel. Extra Prizes—*Nuts*, Mr. Bodger. *Onions*, Mr. Thirkel. *Beans*, H. Jackson, Esq. *Beet*, Mr. Thirkel. *Dahlias*, Mr. R. Freestone. *Onions*, Mr. Thirkel. *Roses*, Rev. W. G. Townley. *Potatoes*, Mr. Thirkel. *Raspberries*, do. *Zinnias*, H. Jackson, Esq. *Prizes given by Mr. Harrison, Downham*, for the best stand of *Dahlia blooms*, Mr. R. Freestone. Sweepstakes for best 12 *Dahlias*, do.—*Cambridge Advertiser.*

Yetholm Horticultural Society, Sept. 9.—The Second Exhibition was held in the Parish School Room. The prizes were awarded as follows:—Dahlias: 1, Mr. A. Herbert; 2, Mr. Alex. Lindores. Hollyhocks: 1, T. Oliver, Esq.; 2, Mr. A. Herbert. Calceolarias: Mr. A. Herbert. Pansies: 1, Mr. J. Sibbald; 2, Mr. J. Bennet. Annuals: 1, Mr. A. Herbert; 2, Mr. J. Sibbald. Herbaceous Plants: Mr. J. Bennet. Onions: 1, J. Purves, Esq.; 2, Mr. Govanlock. Carrots: 1, Mr. A. Herbert; 2, Mr. J. S. Laidlaw. Leeks: 1, Mr. Govanlock; 2, Mr. Purves. Cabbages: 1, Mr. Govanlock; 2, Mr. Alex Lindores. Turnips: 1, Mr. W. Kerr; 2, Mr. T. Oliver. Savoys: 1, Mr. Alex. Lindores; 2, Mr. Govanlock. Greens: 1, Mr. A. Herbert; 2, Mr. T. Lyon. Window Plant: 1, Mr. T. Oliver; 2, Mr. J. Bennet. Best kept Cottage and Garden: Mr. J. Sibbald. *Three prizes of the same value* were awarded to Mr. A. Herbert, Mr. J. Bennet, and Mr. Alex. Lindores, whose gardens were declared equal in merit. *An extra prize* was awarded to Mr. Arch. Hogarth, for *Pears*; and to Mr. A. Herbert, for a *Bouquet of Flowers.*—*Kelso Mail.*

Youghal Horticultural Society, Sept. 14th and 15th.—This exhibition was held in the room of the Mall house, where the following prizes were awarded: To G. Coghlan, gr. to R. Smith, Esq., for *Grapes, Cherries, Nuts, Cabbages, Celery, Carrots, Lettuce, White Beet, Pyramid of Cut Flowers, Dahlias, Coxcombs, Picotees, and Gloxínia máxima.* To P. Keane, gr. to F. E. Currey, Esq., for *Melons, Grapes, Nectarines, Oranges, Lemons, Pears, Cucumbers, Red Beet, Vegetable Marrow, Onions, Seedling Potatoes, Fúchsia fulgens, Cockscombs, Dahlias, Thunbérgia alata, Calceolárias, Balsams, and Cut Roses.* To J. Casey, gr. to W. Moore, Esq., for *Grapes* (*Purple and White Frontignan*), *Figs, Gooseberries, Pears, Apples, Peaches, Onions, Broccoli, Philibértia grandiflora, Prímula sinensis, Bouvárdia augustifólia, best collection of Fúchsias, Dahlias, and Cut Roses.* To T. Joyce, gr. to C. Uniacke, Esq., for *Plums, Artichokes, Fúchsia globosa, and Mushrooms.* To T. Lyons, gr. to Mrs. Uniacke, for *Apples, Currants, Peas, Beans, Potatoes, and Dahlias.* To. J. Casey, gr. to J. Keily, Esq., for *Gloxínia nigra, Poly'gala salicifólia*, and *standard Fúchsia fulgens.* To J. Curtin, gr. to T. John, Esq., for *Chelone barbata, Lily, and Kidney Beans.* To D. Liddon, gr. to N. Uniacke, Esq., for *Plums.* To J. Dawly, gr. to T. Seward, Esq., for *2d collection of Pelargóniums* and *Agave americana.* To J. Power, gr. to Mrs. Green, for *German Asters* and *Cut Flowers.* To E. Gwynne, gr. to Mrs. Marsden, for *Raspberries, Sálvia coccinea, Fúchsia Chándleri.* To J. Lawton, gr. to T. M. Green, Esq., for *Cauliflowers.* To D. Murphy, gr. to R. Pother, Esq., for *Grapes, 2d Melon, Parsneps, Carrots, Cabbages, Celery, Shallots*, and *2d Cockscombs.* To E. Donoghue, gr. to Rev. P. S. Smith, for *Apples, Amaryllis Belladonna, Rosa odorata*, and *Pelargóniums.* To L. White, gr. to Dr. Green, for *Tomatoes in Pots.* To Mr. Graham, for *Fúchsia cónica, Petúnia triumphans*, and *Eúcomis punctata.* To Mrs. T. R. Taylor, for *Globe Dahlias* and *French Marygolds.*

MISCELLANEOUS.

Upon Albumen, especially that of Leguminosæ, by ***Drs. Schleiden and Vogel*** (abstracted from the German).—That the presence or absence of albumen in plants is of great importance, has been shown by the researches of Mirbel, Brown, and Brongniart; and it has been made by Lindley to form an important element in the grouping and distinguishing natural families. The foundations of the science of embryology in plants were laid by Malpighi, but it has been neglected by the followers of Linnæus, who, in fact, have degraded a great science to a pretty game for filling up idle hours. Brown was the first of the present day to revive and carry out Malpighi's views, which had been more or less misunderstood by those who had followed him.

1. *On the formation of Albumen.*—The essential parts of the ovule are the nucleus and embryo sac, which are never absent. The integuments are uncertain; where the integuments unite with the nucleus, the part is called chalaza. In Canna and most Compositæ this union is very extensive, and the integuments are only seen at the point of seed. In the embryo-sac, a portion of cellular tissue is often developed and again absorbed; this is Mirbel's quartine. In seeking for albumen, the positions in which it might be expected to be found are, 1, in the integuments, 2, the nucleus, 3, the embryo-sac, 4, the region of the chalaza. It is, however, never found in the integuments, but in all other parts. In Monocotyledons, albumen is mostly found in the embryo-sac, reducing the walls of the nucleus, by pressure, to a thin membrane. It is difficult to say whether the membrana interna of the ripe seed is formed from the integumentum internum of the ovule, from the membrana nuclei, or from a combination of both. It may be sometimes formed from each. In the process of growth the embryo-sac becomes filled with cellular tissue, which produces the albumen. Examples may be seen in Philydrum lanuginosum, also in all Aroideæ, Gramineæ, Cyperaceæ, Liliaceæ, Palmaceæ, &c. Scitamineæ are an exception, for excepting Canna, they develop their albumen in the nucleus, as in Maranta gibba. The development of Canna is altogether peculiar. The albumen is developed in the region of the chalaza, and although five layers can be distinguished they can none of them be identified. In Dicotyledons the growth of the albumen is not so uniform, in these whole groups of families being characterised by its presence or absence. The albumen formed in the embryo-sac is called Endospermium, while that formed in the nucleus is called Perispermium. When the embryo-sac does not fill the nucleus, and the embryo does not fill the former, both perisperm and endosperm are developed, as seen in Nymphæaceæ and Hydropeltideæ; also in Piperaceæ. In Chelidonium majus, the endosperm is alone developed; and this is the case with all Papaveracéæ, Ranunculaceæ, Umbelliferæ, Rubiaceæ, and principally the case in all the orders of Lindley's group Albuminosæ. The perisperm is probably developed in all families which have what is called albumen centrale.

2. *On the Structural Relations and Extent of the Albumen.*—In most cases the albumen has the form of the seed on a reduced scale. A remarkable deviation is seen in Convolvulus. The endosperm consists of a double spindle-shaped body, with two wing-like appendages, between which the cotyledons are placed. In many of the Scrophulariaceæ, the embryo-sac forms little cavities or bags, which, in the ripe seed, remain as appendages to the albumen. Albumen, as well as all other parts of plants, consists essentially of cellular tissue the cells of which have contents. Cytoblasts are seen only seldom in the cells of albumen, but may be seen very well in Zea Mays. The cells present all the varieties of ordinary parenchyma, but never any spiral structure. The walls of the cells are generally thin, simple, without evident configuration, as in the case of the albumen farinaceum and carnosum. The walls are often thick and grown together, so that the cells look as if they were cut out of a homogeneous mass, as in the albumen oleosum and corneum. In the Rubiaceæ there are thin spots in the horny albumen, as though pores were forming; the same is seen in the horny albumen of some Palms. In the thin-walled cells pores are very evident. With regard to the general arrangement of the cellular tissue, it has a ray-like texture, from its being developed from the walls of the sac towards the embryo, or if that is very small towards the centre of the albumen. With regard to the contents of the cells of albumen, they do not differ much from those of parenchyma in general. In Alpinia cardamomum, formless masses are observed in the cells of the perisperm. Between the cells of Pothos rubricaulis are found larger cells containing some crystallized salt.

3. *On the Albumen of Leguminosæ.*—If any one should examine the seeds of Cassia, Gleditschia, and Tetragonolobus, he would find it difficult to account for the fact that in recent times albumen had been denied to Leguminosæ. Gærtner originally made exceptions to the statement that they had no albumen; it was confined, by Jussieu, to the orthoblastic genera. De Candolle called the albumen of these plants an Endopleura turmida, and most botanists have followed him. Guillemin and Perrottet, in the "Flora of Senegal," sometimes call this substance albumen, sometimes Endopleura tumida. Braun, in a review of that work, pointed out the fact of the existence of albumen in this family, but did not carry out his views. In order to investigate this subject, and arrive at the following conclusion, more than 300 different kinds of seeds of Leguminosæ have been examined.

3 *a. Formation and presence.*—The ovule of Tetragonolobus purpureus has two integuments covering the nucleus. The embryo-sac developes itself in the vicinity of the micropyle and grows from thence out towards the chalaza. In Brachysema undulatum, the integuments and nucleus are not developed till after the embryo-sac and embryo appear, and the internal membrane disappears with the absorption of the nucleus. In Tetragonolobus the nucleus is first absorbed, then the internal membrane, the entire length of which disappears at the same time. The embryo, in its development, constitutes a transition to that irregular form seen in Lupinus. Ordinarily that part of the pollen tube which has projected into the embryo-sac becomes changed into a part of the embryo; but in Lupinus only a part of the tube becomes organised with the embryo, the remaining portion forming a little cord-like body, called by Mirbel the suspensor. As the embryo-sac extends, it forms cells out of the mucous and saccharine solution in its inside, the cells being developed around the cytoblasts in the manner described by Schleiden. At the same time this cellular tissue is forming the embryo increases in size, and either absorbs this or presses it more or less together; in the latter case it is the seat of the deposit of albumen. This is often the case, and in most instances the nucleus is entirely

absorbed. Hence the albumen of Leguminosæ is endosperm; its greater or smaller thickness depends on the greater or smaller size of the embryo. In the whole family there is a very decided fluctuation in the presence and quantity of this albumen; so that the suggestion of Braun to distinguish the genera of Mimoseæ by it, is quite untenable. In fact there are some very good genera, as Lupinus, in which some species have it and some have none. Lupinus tomentosus and L. macrophyllus both have albumen, L. tuberosus none. In Ononis altissima, it is scarcely to be seen, whilst in O. aculeata it is very abundant. Æschynomene fluminensis has a maximum, whilst Æ. podocarpa has a minimum. Many more examples would undoubtedly occur in large genera, as Trifolium, &c. In Acacia some species have abundance, others none. But if the existence of albumen fluctuates, much more do its relative quantity and its relative position to the embryo. Its development is least decisive in the whole family on the edges of the cotyledons; in Papilionaceæ least at the hilum and in greatest quantity between the radicle and cotyledons, and in the commissure between the cotyledons; in both of which places it may be beautifully seen in Scorpiurus sulcatus, yet it is sometimes wanting here when it appears on the sides of the cotyledons. The quantity of albumen has been supposed to be in an inverse proportion to the size of the plumule, but this is not a rule, even in the genera, to which it was supposed to apply. Nor is a large quantity of albumen accompanied with simple leaves of the plumule, as was supposed by Braun. In opposition to the oft-repeated assertion of Adanson, Jussieu, and De Candolle, it is found that all the principal divisions of Leguminosæ, except Swartzieæ and Geoffreæ, of which only one seed was examined, possess albumen.

3 *b*. *Structure*.—If a layer of albumen is cut, it is transparent, almost of a horny consistence, becomes gelatinous in water, is almost insipid to the taste, and consists of vegetable jelly (P. pflanzengallerte of Schleiden) or mucus (P. pflanzenschleim of Berzelius). In most cases the colour is whitish, in some beautifully white, as Cytisus, Kennedya, &c. When it is transparent, so long as the testa remains on, it has a variety of colours. In Bauhinia microphylla, the albumen was of a wood-yellow colour. Where the albumen is tolerably well developed, three layers are observed; first, that next the testa with regular cells, well defined walls, and ordinarily granular mucous contents: the cells are arranged in only one row. This layer is well seen in Astragalus hamosus, Sesbania cannabina, &c. In the second layer there is a number of variously formed cells, constituting the great bulk of the albumen; these are succeeded by a third row placed next the cotyledons, which are small and without granular contents. In the middle layer the cells have either very sharply defined walls, or they are lost in jelly. The former are most common in Papilionaceæ, the latter in Cæsalpineæ. When the walls of the cell are evident, jelly is found in the inside of the cell, often obstructing the entrance of the light, as in Sesbania cannabina, &c., it is entirely obstructed in Securigera coronilla. Frequently the cavity of the cell presents a star shape, from the formation of pores in the jelly, or gelatine, as in Cytisus Laburnum, &c. Intercellular spaces are seen in Amorpha fruticosa, &c., which are also filled with jelly. These form a transition to those in which the cells are entirely embedded in jelly, as Gleditschia triacanthos. The walls are not to be distinguished but by dropping on them sulphuric acid, by which means the jelly is dissolved out. The interior of the cells is filled with mucus (Schleim), a term used to distinguish it from jelly and starch. This mucus is composed of globules, which are coloured brown yellow by tincture of iodine. In Cassia fistula resinous globules were found, and in Mimosa pudica, crystals in the same position. This jelly or gelatine between the cells, seems to be identical with Mohl's intercellular substance, and it may be conjectured to be the basis from which the cells of the albumen themselves are formed.

On the State of Agriculture in Italy.—(*Extracted from the Agronomical Part of the "Atti della Terza Riunione degli Scienziati Italiani*."*—The necessity of an improved educational system of the poorer, especially the working, classes was first alluded to, and the necessity of a greater extension to be given to elementary instruction generally acknowledged. It was stated, that the general and the agronomical instruction of the country population, as well as the improvement of agricultural paupers, could be much advanced by the landed proprietors taking it up, especially such as reside part of the year on their estates. A commission was appointed to take cognizance of, and to compare the best popular books on agronomy and technology, especially such as may be useful in the schools for the working classes.

The next matter discussed was the compilation of agricultural statistical tables for the whole of Italy. A certain form of synoptic tables was agreed upon, which had to embrace the natural condition of the country, the laws relating to agriculture, agronomic practices, and the condition of the labouring population. In Tuscany, the Transactions of the *Academia dei Georgofili*, and in Lucca where M. Mazzanosa has lately published a work on that subject, the tables are expected to be most satisfactory. It was also discussed, whether the principle of *association* might be resorted to in places where landed property has become so much divided as to deprive the owner of the means of cultivating the land to the greatest advantage.

Amongst the especial objects of agriculture, Rice excited most attention; and the discussions thereon occupied three meetings. In all countries which contain much boggy land, as is the case in all maritime parts of Italy, and even in some situated in the middle of the peninsula,—everywhere, moreover, where the temperature is high enough,—the culture of this sort of grain is most important. Legislation, however, differs with respect to this sort of agricultural produce: in some parts of Italy it is allowed, and in others prohibited by law.

In the plains of Lombardy, Rice is one of the most important products, and Tuscany exports annually Rice to the value of fourteen or sixteen millions of francs, after its four millions of inhabitants have been provided for. In the environs of Pisa and Pietrasanta, in Tuscany, as well as in the maritime parts of Lucca, its culture has been permitted of late, but still only as an experiment. In the latter country the cultivation of Rice was allowed until 1612, at which period it was prohibited: in 1822 it was again permitted, but this liberty was soon withheld, as it appeared that the air became thereby impaired. In Bologna the plantations of Rice are permitted, but upon condition that, after the soil has been raised and dried, other crops shall be grown upon them. This subject was broached by M. Massei of Lucca, and after several speakers had been heard, a report was ordered to be made concerning it. Although the opinions were not unanimous, yet a majority decided, that the culture of rice in boggy localities was not only far from being detrimental, but was really advantageous, and that it was merely a prejudice of the farmer and labourer, who objected to it, in some cases, most strenuously. In the first instance, the *air* will never be impaired by growing Rice in boggy places, where no other crops can be raised, yet many concomitant circumstances are at present adverse to its cultivation; for instance in the Maremma, there is a deficiency of people to attend to the timely gathering of the crops, and on that account also, the waters cannot be constantly kept flowing in the surrounding ditches, as has been much practised of late. In the Maremma, whole tracts, consisting of plains, whence the waters cannot deflux, is an impediment to the culture of Rice. It was acknowledged, that dry land should not be taken up with this crop, as the quantity of water which the plant requires cannot but impair the condition of the air. Great caution, therefore, in the extension of its culture was recommended; the more so, as the desire of gain had lately substituted in Lucca the culture of Wheat and Indian Corn for that of Rice. A French physician asked, whether the cultivation of Rice was not productive of Pellagra (an endemic disease); this was, however, refuted by its existence in places where no Rice was grown.

The next topic was the culture of the Vine. It appeared, that its growth in Tuscany and other countries yielded now little profit, and that prospects were still worse. Vineyards planted in plains, and which yield but inferior wine, had increased greatly of late; so much so, that from the large produce (much above real consumption) and its inferior quality, Grapes and Vines had become rather a burden than otherwise. M. Ridolfi proposed the distillation of spirits as of equivocal and doubtful expediency. Much was said about the utility of classification of the different Italian Vines; yet the many unproductive attempts made in France and Italy, even where ample means were at command, seems to promise little hope of a beneficial result. Prince Canino related several cases, where one sort of Vine had sported into another, by being transplanted into another soil.

The growth of Silk occupied much of the Society's time; and the beauty of the Chinese cocoon was mentioned, which is not, however, much in use, as the quantity of silk it yields is smaller than that of other sorts. The question, as to whether the silkworm will live upon any other food than that of Mulberry-leaves (in a pulverised form) was answered in the affirmative; but the possibility of obtaining different colours of cocoons, by mixing dyeing pulverised substances with the Mulberry-leaves, was disproved.

No kind of Potatoes has hitherto succeeded in Tuscany. As it was expected, the great drought and heat destroy the herbage in the month of August, thus requiring the tubers to be raised long before they are ripe; consequently they will not keep long. In mountainous situations they succeed better, but, generally speaking, they are only grown in gardens. According to the observations of Vidalfi, the sweet Potato (Convolvulus Batatas) succeeds much better; as it can stand a greater degree of drought and heat, and its copious herbage yields a superior fodder for cattle. The trials with beet have also been unsuccessful.

Many projects were started about the preservation and culture of large FOREST TREES. Every traveller in Italy must have observed that, partly from negligence and interested motives, the forests have been nearly destroyed throughout the country. The following statements were made by different members, viz.,—that there is a want of protection against noxious winds—that on the coast, as well as in the interior, the rain has full power to carry away all the soil from the surrounding heights, whereby even the beds of the rivers have been changed; at the same time that the latter have lost many of their most copious sources. The value of firewood, or timber for building purposes, has also much increased. It was gratifying to hear that this devastation has been checked in several parts of Italy, and that both Government as well as private individuals have attempted to *replant* several tiers of mountains with fresh forests; and that these attempts have succeeded perfectly. We may state, in conclusion, that great discretion was shown in discussing subjects, principally *Italian*, at these meetings, and in the inquiries having a practical tendency.

Lælia Superbiens.—We learn with great pleasure that this noble plant, supposed to be the Queen of the Orchidaceous order, is about to flower in the garden of Mrs. Wray, of Cheltenham. To have been the first to blossom such a plant, which so many others possess, will be indeed a triumph for this lady's gardener.

GARDEN MEMORANDA.

Margam, Glamorganshire, the seat of C. R. M. Talbot, Esq., M. P.—At this place there is now in flower a magnificent specimen of the American Aloe, which is about 50 years old, and grows in a box nearly five feet square. For seven months in the year it is kept in the greenhouse, and during the other five rejoices in the open air. The breadth of this noble plant is full nine ft. From the centre of the leaves, after the repose of half a century, an enormous stalk has suddenly issued forth, which, in less than three months, has attained the amazing height of 21 ft. 6 in.—viz., up to the flower-stem 11 ft., and from thence to the summit 10 ft. 6 in. The circumference of the stalk, 3 ft. from the ground, is 14 inches. The pyramid and cluster of Liliaceous yellow flowers, with which it is crowned, are very beautiful. These, as Botanists well know, have no cups, but a large funnel-shaped six-lobed corolla, six stamina, and an oblong germen under the corolla, supporting a single style, succeeded by a large triangular capsule. On the 14th of June last the stem began to show indications of movement, and from thence its growth was marvellously rapid, occasionally exceeding 3 inches in the day; and this continued until near the 14th of Sept., since which period it has gained scarcely anything. The plant is now in high beauty, and is daily approaching to its most perfect state. It will be remembered by many of our friends, that in October 1820, a superb specimen of this Aloe was in full bloom. That plant, however, was known to have been nearly a hundred years old.—*W. Kent, Sept.* 28.

Wrest Park, Bedfordshire, the seat of Earl de Grey.—The Kitchen Garden is extensive, and is scarcely completed; the walk edgings, intended to be formed of stone, being not yet put down. The crops are growing luxuriantly, as are also the trees upon the walls; and it will not be out of place to mention that this garden consists of a soil made to the depth of three feet, which fully confirms Mr. Clark's statement in a late Number of the *Chronicle*, none of the plants having suffered from drought during the last summer. There is a pretty range of houses devoted to Peaches and Grapes, with the exception of a small plant-stove, situated in the centre. Amongst many other fine specimens we noticed the following:—Bignónia Cherere and venusta, Pergulária odoratíssima, and a vigorous plant of Combretum purpúreum, Passiflora Loudoni and alata, were hanging in festoons from the rafters, producing their flowers in abundance, intermixed with those of the beautiful Ipomœa Learii, and Horsfálliæ. Here was also another beautiful plant, the cultivation of which is much neglected, although it produces its flowers in great abundance, viz. the Angelónia salicariæfólia; this plant, at the time we saw it, was one mass of bloom, and being of a pretty habit of growth, it is deserving of especial notice. In the flower-garden is a well-formed *standard* of the Ribes sanguíneum, which, we were informed, produces a good effect when in flower. At one end of the mansion is a small Conservatory, containing Orange-trees, Caméllias, &c., various climbers being trained up the rafters and supports of the house. In front of it lies a small flower-garden, not yet planted; but the beds are neatly arranged, and their edges are formed of stone, similar to that intended for the Kitchen Garden. Fronting the mansion is a broad terrace, raised above the level of the lawn, from which it is parted by a neat and ornamental iron fence. In various parts of the extensive pleasure-grounds are some noble specimens of trees, especially a large Silver Fir, the trunk of which is straight to a great height, and which is supposed to be the finest specimen of the kind in England. Several young ones have sprung up around it, and promise to be equally ornamental. Some pretty pieces of water, which if well arranged are indispensable to garden scenery, are interspersed over the grounds amongst a variety of architectural ornaments., &c.—*J. A.*

Review.

Cottage Residences; or, a Series of Designs for Rural Cottages and Cottage Villas, and their Gardens and Grounds; adapted to North America. By J. A. Downing, 8vo. Wiley and Putnam, New York and London, 1842.

We have been favoured by Mr. A. J. Downing, of the Newburgh Botanic Garden, New York, with a copy of his work on Cottage Residences; and of which we should have been happy to express the good opinion which was suggested to us by a somewhat superficial examination of its contents. As, however, the subject is not exactly within our department, and as we were on a late occasion called to account for our honest though perhaps imperfect judgment in a similar matter, we thought it best not again to venture out of our own particular province, and therefore consigned the book to our Warwickshire acquaintance, Mr. Stephen Stump, requesting him to favour us with the sentiments of the "Club" on this new production of the Transatlantic Press. The following is Mr. Stump's reply:—

"Sir,—Much obliged to your kindness in sending us Mr. Downing's book about building cottages in America, and very proud of your condescension and good opinion in asking us for our sentiments concerning it. When we took courage to write to you a few months ago, we little thought that we should be set up for critics, and even now we are rather afraid that you are only making game of us. We know enough of our countryman (I had almost called him our neighbour), William Shakespear, to recollect that some one says, "I am nothing if not critical." Now we are not at all critical, and don't in the least understand the business; but we did not like to be set down for boobies that could not put two rooms and a cupboard together, with common sense. We are plain hard-working people and very poor scholars; but if you will have our opinions, why you must. In the first place, we were all very glad to find that Cousin Jonathan has time and money, and inclination, to think of making his dwellings ornamental as well as useful; and we were rather surprised to see what nice paper, and print, and pictures he can turn out. In our out-of-the-world place, we had no idea that he had got so *far-a-head*, as I think he calls it.

In respect of the writing of the book, there is a deal of good sense, and very much to the purpose, especially about the management of the plans; though it seems that they use the word *pantry* in a rather different sense to ours, because they have a small room so called in connexion with the dining-room, even in good houses; but this may perhaps be partly explained by their having inferior servants, as indeed the author somewhere says; and so, probably, it is found advisable to place close to the dining-room many of those things which are, in England, given into the keeping of the housemaid or footman.

---

* Published by order of the Grand Duke. Florence, 1842, 4to.

We do not profess to have much taste in our club, so we must speak cautiously of the designs. They do not seem to us quite so good as they might be, considering that America must have had the benefit of all the beautiful works published on these subjects in this country by Mr. Robinson and others. In Mr. London's book, we think the designs are generally much prettier than those in Mr. Downing's. We ought, perhaps, to make allowances for the first beginnings in a new country, which has not our Gothic cathedrals and churches to look at; but the Gothic design, No. 10, which is the grandest in the book, and is called "Beau Ideal Villa," whatever that may mean, is certainly not a very good specimen. The author boasts that, although only a moderate sized house, it contains examples of nearly every sort of window, gable, and buttress, used in the period to which it belongs. Now this we do not think any beauty. In the perspective view, which shows only two fronts, you may count no less than six different sorts of gables and about twelve or fourteen different sorts of windows. Our mason, who is a queer fellow and will have his joke, calls it gables gone mad and windows bewitched; and says it reminds him of the showman's description of the leopard, that had twenty thousand spots upon his body and never a one alike. But there is a worse fault than this vast variety of gable. As gable is properly the end wall of a roof, whereas, in this design, there are gables at the sides as well as ends of the roofs, in places where they could not possibly do, or pretend to do, any useful office; and where they only distract the eye by an unmeaning confusion of parts, having no object but dissimilarity.

In regard to their skill in putting their houses together, the book does not give much information, but they are greatly behind us in their notions of cementing. Mr. Downing says it is a common complaint, that their outside cementing will never stand the weather, and he gives directions for doing it properly; but we can venture to tell him that his instructions will not mend the matter. Their whole system is bad. They mix one-third of cement with two-thirds of common mortar, made of slaked lime, which has been kept some time in the usual way. Now the operations of a cement and of common mortar are totally different, and they cannot successfully be used together for outside work. A cement *sets*, as it is called and hardens very quickly; mortar does not set at all, it hardens gradually and takes years to become thoroughly so. It is clear that they do not understand our mode of mixing the hot fresh-ground cement with pure sand only: nor do they seem to understand the principle on which the cementing properties of poor lime-stones depend. They call the cement "hydraulic lime," which we did not comprehend; so we asked our curate, and he says that although he does not understand plastering, he once knew enough of Greek to be sure that *hydraulic lime* must be nonsense; but this we leave to your superior judgment.—I am for the club, your servant,

Stephen Stump."

CALENDAR OF OPERATIONS *for the ensuing week.*

Although trees and shrubs might be safely removed at any period when vegetation is dormant, autumn is the season when that operation is to be performed with the greatest facility, and the least risk of failure. The ground at that time, not being saturated with the winter rains, works freely, which enables the operator to preserve more of the delicate fibrous roots, and also to do his work with greater expedition,—an object of considerable consequence where there is much planting. The plants are likewise benefited by their roots becoming properly settled in the soil, and thereby prepared to recommence their functions upon the first impulse given by the warm weather of spring. Whenever, therefore, a change of colour in the foliage announces that growth has ceased, planting should be proceeded with. Not only the life or death at the time of planting, but the future growth and productiveness of a tree, depend very materially upon the manner in which it is planted, and yet this operation is too generally performed as though it were of no moment whatever. A thriving plant is recklessly dug up with a loss of one half of its feeders; it is then sunk into a deep pit, in such a manner that one half of the remaining roots are so doubled and cramped, that they can be of little or no use in supplying sap to the branches and leaves, and the natural consequence is, either speedy death, or a languid and unprofitable existence for years to come—while a little additional labour would have insured a healthy and vigorous tree. The principal art in taking up a tree, is to retain as many of its roots as possible; and in planting it, to make a wide hole, in which those roots should be spread out near the surface, in horizontal layers, carefully separated from each other by well-broken soil, and not clustered together in tangled masses, one overlying and pressing upon the other. These observations (which, however, are more particularly applicable to fruit and ornamental trees) may possibly tend to prevent the young planter from falling into that careless and reprehensible method which has caused the death or the ruin of thousands of promising plants.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—If the temperature of the bark-bed has considerably declined, it should be restored, if possible, without removing the plants until the beds are made up for winter. That may now be done where bark only is used, taking care to turn the whole mass to a good depth, and to mix the fresh material thoroughly with the old, so as to obtain a moderate and lasting heat. Use despatch in returning the plants to the stove; and, in setting them, see that the pots stand quite level. The pots must not be more than half plunged, and that part of the plant which before faced the front should now be turned towards the back of the pit; if any are showing fruit, set them at the warmest end of the house. When leaves are used, as these cannot yet be procured, the heat should be revived by taking out trenches at the back and front of the pit, and filling them with warm bark.

Vinery.—Pot-culture of Vines has been fashionable of late; the system, however, is not recommendable on the score of economy, although when a few bunches only of very early Grapes are wanted, without forcing a vinery, it may be followed with advantage. For this purpose the plants should now be pruned; and if, as formerly suggested, the pots were not filled to the rims at the last shifting, the lower part of the Vine-stems may be coiled round the inside of the pots, and then covered with rich compost, into which the stems will strike young roots when the plants are excited into growth.

Peach-house.—It is customary in some gardens to take the sashes off Peach-houses that are not forced early, as soon as the wood appears to be ripened, leaving the trees exposed to the weather all winter, with a view, it is supposed, of destroying insects; but it is doubtful whether that or any other advantage results from the practice. Where it is followed, the heating apparatus must be guarded against frost; if pipes, by emptying them; if flues, by covering them with litter.

Cucumbers and Melons.—The temperature of the pits in which Cucumber plants are now bearing ought not be below 70° for any length of time. If hot-water pipes are used, the lower one may be partly immersed in a trough of water, in the manner described by Mr. Green. This keeps the atmosphere so full of moisture, that the most dangerous insect enemy of the Cucumber plant—the red-spider—cannot exist. We have lately seen troughs of brown carthenware, made with a concave bottom, purposely for fixing upon the pipes of forcing-houses.

Out-door Department.

Taking up and storing the various winter crops is now the principal occupation in this department. When that is completed, let the cleared ground be immediately manured and ridged, or roughly dug. We find the Onion grub less injurious on ground which has been recently trenched; that, therefore, which has been used this season for Parsneps and Carrots, may be prepared to receive Onions next spring. Clear the ground of old Cabbage stalks that are not worth keeping to produce sprouts; a good number should, however, be retained for that purpose. Take advantage of fine days, of which many can scarcely be expected after this time, to clean every corner of the kitchen-garden against winter.

Cauliflowers.—A number of the strongest plants which have been pricked out may be potted in small pots, to be wintered in some of the pits or late forcing-houses from which frost is excluded. If planted out in spring on a warm border, these will furnish some early heads. Any Cauliflowers, or Grange's White Broccoli, that are now fit for use, should be dug up and placed under shelter before a sharp frost is likely to occur. Endive is often damaged at the heart early in autumn by a single night's sharp frost. This might be prevented with very little trouble by throwing a few old mats over the full-grown plants when there is an appearance of frost. Whenever the plants are found to be thoroughly dry, a good number ought to be tied up or covered for blanching.

Lettuce.—Finish the pricking out of young plants to stand the winter. Any frames that are not likely to be wanted for other uses early in spring might be filled with the largest plants, which, if encouraged to grow, will come in usefully after Christmas.

Orchard.—Vacancies on walls should now be made good with healthy young trees. If the borders are old and stale, it will be best to fill the holes with fresh soil, unmixed with dung or other manure. In planting, particular care must be taken to lay out the main roots in such a manner, that their growing points may not dip downwards. It should be remembered that the slender thread-like roots of a young tree will, in the course of time, become the main channels through which all the sap, sucked from the earth by numberless spongioles for the support of the full-grown tree, must pass; the arrangement of these roots is, therefore, of importance.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—If possible, keep the plants perfectly clean; look carefully after all insects which infest them. Gradually increase the temperature by artificial heat as the evenings get colder; it ought not to be much below 60 degrees in the morning. In the cool Orchidaceous house, all that is necessary is, to light a gentle fire early in the evening, and allow it to go out as soon as the pipes or flues have become heated. If the weather continues fine, no fire-heat will be required in any of the houses during the day.

Greenhouse and Conservatory.—All plants which require protection from frost, and which are of much consequence, ought now to be housed. Chrysanthemums should either be placed where they are to bloom, or set in a vacant Vinery or Peach-house, to forward their buds. Whenever the sky is clear in the evening, the sashes of plant-houses should be closed; at other times give air liberally.

Pits and Frames.—Roses, which are wanted to blossom early, should be forwarded now in a gentle heat. A little attention will cause some of the tea-scented kinds to continue blooming. Many late-flowering plants, which have been growing all summer in the open ground, will bloom next month if they are now carefully taken up and potted. Of these, Sálvias, Agératums, and Leonotis, may be instanced.

Out-door Department.

As the flower-garden beds become vacant, let them be neatly raked over; or, if time permits, they may at once be manured and dug. Naked beds seen from the windows of the dwelling-house are objectionable. The most conspicuous of these might be made more agreeable to look upon in winter, by temporarily filling them with low evergreens in pots, to be removed again in spring when the beds are wanted for planting. Ornamental shrubs of all kinds may now be planted.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Proceed with the work mentioned in the two last Calendars.

Forest and Coppice Woods.—Those who intend to plant largely should now make a selection of healthy young trees. The nature and quality of the ground intended to be planted ought also to be previously ascertained, and the kind of tree best adapted for each particular soil decided upon before this operation is begun. This forethought is very essential to profitable planting.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending Oct. 6, 1842, as observed at the Horticultural Garden, Chiswick.

		Barometer.		Thermometer.			Wind.	Rain.
Sept.		Max.	Min.	Max.	Min.	Mean.		
Friday	30	30.150	30.128	57	44	50.5	N.E.	.01

Average		30.209	30.141	58.7	34.1	46.4		.01

Sept 30. Clear and fine throughout the day; overcast; slight rain at night.

Oct. 1. Foggy; light clouds and fine; clear at night, with slight frost, the first for the season, towards morning.

2. Foggy; overcast and fine; clear at night.
3. Foggy; lightly overcast and fine.
4. Light clouds; very fine; clear and frosty at night.
5. Frosty; slight haze; cloudless and very fine; slight frost at night.
6. Slight frost early A.M.; light clouds and very fine; overcast.

Mean temperature of the week 7.2° below the average.

State of the Weather at Chiswick during the last 16 years, for the ensuing Week ending Oct. 15, 1842.

Oct.		Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds.

The highest temperature during the above period occurred on the 11th, in 1832—thermometer 72°; and the lowest on the 14th, in 1838—thermometer 20°.

REPORT ON COVENT GARDEN MARKET,

For the week ending Oct. 7, 1842.

There has been little variation in the prices of most articles during the past week; the market has been well supplied, but trade continues dull. *Fruit*: Amongst the Pines there are many handsome fruit. Melons are nearly, if not quite, over. A few of the October Peaches are still remaining, which appear to be pretty good, and fetch from 4s. to 7s. per doz. The only dessert Plum left is the Imperatrice, which is selling at 1s. per punnet. Pears of the most esteemed kinds, are very plentiful; the Louise Bonne (of Jersey), from 2s. 6d. to 3s. per half-sieve; Marie Louise, from 2s. to 4s. per half-sieve; Brown Beurré, from 3s. to 3s. 6d. per half sieve, and Gansel's Bergamot, from 2s. to 2s. 6d. per dozen. Baking Pears have also made their appearance, from 2s. to 3s. per bushel. The principal dessert Apples are the Ribston Pippin, and the Court of Wick; the former being from 4s. to 5s. per bushel, the latter from 1s. 6d. to 2s. 6d. per half-sieve. The Blenheim Orange and the Flower of Kent, amongst the culinary kinds, are remarkably fine, and fetch from 3s. to 4s. per bush. Walnuts, Filberts, and Nuts are abundant, and of good quality. The Cob Nuts which appear to be the best, are selling from 70s. to 80s. per 100lbs. *Vegetables*: the supply of Cauliflowers is decreasing fast, but Savoys and other winter greens are becoming more plentiful. Young samples of French Beans and Scarlet Runners are scarce in consequence of the late frosts. Onions are good, and fetch from 4s. 6d. to 5s. 6d. per bushel; small ones, for pickling, from 3s. to 4s. per half sieve; and green ones, from 4s. 6d. to 5s. per dozen bunches. We noticed some remarkably large Red Celery, clean and well-blanched, from 1s. 6d. to 2s. per bundle. Vegetable Marrows are less plentiful, and their season will shortly be over. Field Mushrooms have advanced considerably in price, and fetch from 8s. to 9s. per bushel. Truffles are not scarce from 2s. 6d. to 3s. per lb. *Flowers*: amongst the cut flowers, we observed Cactus Ackermanni, Daphne cneorum, Chinese Primroses, Globe Amaranths, Pelargóniums, Ericas, Roses, and Verbenas.

PRICES, Saturday, Oct. 8, 1842.—FRUITS:—

Pine Apple, per lb. 3s to 5s
Grapes, per pound, 1s to 2s 6d
— Muscats, per pound, 2s 6d
— Spanish, 9d to 1s 6d
— Portugal 1s to 2s
Peaches, per doz. 4s to 7s
Plums, dessert, per punnet, 1s
Damsons, per hf. sieve, 2s to 3s
Bullace, per hf.-siv., 1s to 3s
Apples, dessert, per bush., 3s to 7s
— Kitchen, 2s 6d to 6s
Pears, dessert, per hf.-sieve, 1s 6d to 3s
Quinces, per hf.-sv., 3s to 4s
Berberries, per hf.-sieve, 2s 6d to 3s
Cucumbers, per doz., 1s to 3s

Oranges, per doz., 1s 6d to 3s
— per 100, 6s to 18s
Lemons, per doz. 1s 6d to 4s
— per 100, 10s to 30s
Almonds, per peck, 6s to 7s
Sweet Almonds, per pound, 3s
Chesnuts, per peck, 4s to 8s
Walnuts, per bush., green, 3s 6d to 5s
Filberts, English, per 100 lbs. 60s to 70s
Cob Nuts, per 100 lb., 70s to 80s
Hazel Nuts, per peck, 2s
Nuts, per bushel—
— Brazil, 16s to 20s
— Barcelona, 24s

VEGETABLES.

Savoys, per doz. 1s.
Cabbage, per doz. 10d to 1s
— plants, per doz. 1s 6d to 2s
— Red, for pickling, 1s 6d to 2s
Brussels Sprouts, per hf.-sv. 1s 6d to 2s
Broccoli, per bunch, 1s to 1s 3d
Cauliflowers, per doz., 4s to 5s
Beans, Kidney, per hf. sv., 2s to 2s 6d
— Scarlet, per hf.-sv. 1s 6d to 1s 9d
Potatoes, per ton, 40s to 70s
— per cwt. 2s to 3s 6d
— per bushel, 1s 6d to 2s
— Kidney, per bu., 1s 9d
Jerusalem Artichokes, per half-sieve, 1s 6d to 2s
Turnips, per doz bun., 2s to 3s
Carrots, per doz. bun., 3s to 4s
Red Beet, per dozen, 9d to 1s
Parsneps, per dozen, 1s. to 2s
Horse Radish, per bundle, 2s 6d to 5s
Radish, per doz. hands (24 to 30 each) 1s to 1s 6d
— Turnip, p. doz. bch., 1s to 1s 6d
Spinach, per sieve, 1s 6d to 1s 9d
Leeks, per doz. bun., 1s 6d to 2s

Shallots, per lb., 1s to 1s 2d
Onions, per bushel, 4s 6d to 5s 6d
— Green, p. doz. bun. 4s 6d to 5s
— Spanish, per doz. 1s 6d to 6s
— for Pickl., per hf.-sv. 3s to 4s
Garlic, per lb. 6d to 8d
Lettuce, Cabbage, p. sc., 1s to 1s 3d
— Cos, 1s to 1s 3d
Endives per score, 1s 3d to 1s 6d
Celery, p. bd., red (12 to 15) 1s 6d to 2s
— White 9d to 1s
Small Salads, per punnet, 2d to 3d
Watercress, per doz. sm. bun. 4d to 6d
Parsley, per doz. bun., 1s 6d to 2s
Tarragon, per doz. bun., 2s to 3s
Sage, per doz. bunches, 1s 6d to 2s
Mint, per doz. bunches, 2s
Savory, per doz. bunches, 1s to 1s 6d
Vegetable Marrow, per doz., 6d to 8d
Tomatoes, per hf. sv. 2s 6d to 3s
Capsicums, Ripe, per 100, 4s to 4s 6d
Mushrooms, per pottle, 1s to 1s 3d
— Field, per bus., 8s to 9s
Truffles, per pound, 2s 6d to 3s

Notices to Correspondents.

We shall be obliged if our Correspondents, in their future communications, will take care that no general question relating to *different* subjects is asked in the same paragraph, and that each question is headed with the principal subject. *One side only of the paper should be written on*, so that we may separate each question. If these directions are observed, it will greatly facilitate our obtaining answers, and will enable us to arrange our Correspondence under general heads, separating those questions and answers which are of interest merely to individuals, from such as are of general interest.

Bulbs.—*R. F.*—As the Bulbs, which you have received from South America, are already beginning to grow, your only plan is to pot them directly, and protect them during the winter in a cool and airy part of a pit, as you have not got a greenhouse. Do not water them until you find that they have begun to root in the soil. When water is given, it should be done liberally, and only in fine weather.——*Gladíolus.*—The bulbs of Gladíoli usually commence growing at this season. As yours have only just started, you had better let them remain in a cool situation, and in the pots they now occupy, for another month; after which they may be potted into fresh soil. All that they will require during the winter will be, protection from frost, and water when they have formed roots, with as much air as you can give them. Your plan of forcing them into growth by gentle bottom-heat is a bad one; Gladíoli are plants which succeed best when kept cool throughout the whole year. We are not aware that any mode of classing the bulbs has yet been adopted.—‡ ——*T. Davis.*—In order to throw your Amaryllis formosíssima into flower, we would advise you to diminish the supply of water gradually, and to keep it in a warm and dry situation through the winter. In the spring it may be repotted, and should then be set near the glass and watered freely. The chief requisite towards growing it successfully is to allow it alternately a period of excitement and repose. Amaryllis Belladonna usually flowers freely; probably the leaves of your plant have been injured by some means, and if such has been the case, it accounts for your want of success in making it bloom. The foliage of bulbous plants should always be allowed to decay naturally.—‡

Onions.—*A Constant Reader.*—The bulbs of Onions will be benefited by bending down the leaves, provided the stems are not broken, or otherwise materially injured.—‡

Preserving Fruit.—Can any of our *Correspondents* inform us of the best manner of preserving Walnuts, so that they will neither shrivel, become mouldy, nor lose their flavour?

Wintering Plants.—*J. A.*—Your Fuchsias will not survive the winter in the open border unprotected. You may preserve them by covering the soil above the roots with old tan or decayed leaves to the depth of six inches, and by tying the branches of each plant as closely together as you can without danger of breaking them. They should then be covered separately with a thatch of straw firmly secured to them, and gradually diminishing in size towards the top, for the better resistance of wet and snow. If this thatch is fixed on securely, the plants will live through the winter, without losing even the tips of their shoots. ‡——*Hibernia.*—The most certain method of preserving Sálvias through the winter is, to take them up, and repot them; they may be then kept in a cool frame, provided the frost is not admitted. Sálvia fulgens and S. patens will survive in the open ground, if protected above the roots by a covering of old tan, or cinder ashes: or, after the foliage of the latter plant has been destroyed by frost, the root may be taken up and stored away like the Dahlia. A few instances have been known in which Verbenas have lived through the winter in the open ground; but this has occurred only in favoured situations. They, as well as Herbaceous Calceolárias, must be wintered either in a cold frame or in a greenhouse.—‡——*J. L. S.*—Where plants are wintered in cold frames, the essential point is to keep them dry. In foggy weather the damp air should be excluded, by keeping the glasses close, and air should only be given when the weather is clear.—†

Laurel-berries.—*A Cantab.*—These fruits should be allowed to hang until perfectly ripe, and should then be sown immediately. If kept, they are apt to lose their vegetating powers. You had better sow those directly which you have gathered and kept upon an airy shelf until they have shrivelled up.—‡

Heating Apparatus.—*A Well-wisher.*—The old form of Rogers's boiler was that of a truncated cone, whose sides were hollow and filled with water, whose apex was at once the chimney and fuel door, and whose base was the grate on which the fire, enclosed in the interior of the cone, rested. They are now much improved, while the principle of putting the fire in the midst of the water is preserved. You may rely upon it, the cheapest way of obtaining such a boiler is to buy one from those who make them in quantities; to have a single one made from a drawing would be much more expensive. They are excellent for garden purposes. You will find a full account of them, as originally contrived, with woodcuts, in the *Gardener's Magazine*, Vol. XVI., p. 132.—†

Fall of the Leaf.—*A Dabbler.*—In all cases the oldest leaves of plants are those on the lower part of a stem; and they fall first, because their separation from the stem is the result of old age. Observe any of your trees, and you will see that such is the case. Your Ipomœas Leárii and Horsfálliæ are only obeying the universal law, in doing the same.—†

Window Gardening.—*J. L. S.*—Succulent plants in the window of a sitting-room scarcely require any moisture during winter. They may shrivel, but they will not die, unless frozen. The truth is, that if in such situations they are compelled to drink by having water supplied to them, they are unable, from want of light and heat, to digest the water they have absorbed, and this causes them to rot. A warm room suits them better than a cold one; but a cool one better than either.—†

Fertilization of Plants.—*R. G. Y.*—It is believed by many physiologists that the stigma of a flower cannot receive the influence of more than one kind of pollen, nor of that kind more than once. We are, however, satisfied that this is a mistake; and that several kinds of pollen *may* produce each its own effect at the same time, provided the seed-vessel contains several seeds. An explanation of the reason of this would require more space than we can at present afford; it may be collected from the "Theory of Horticulture," p. 332. One of these days we shall address ourselves formally to the question of muling, and illustrate the whole operation in all its bearings.—†

Pine-apples.—*W. H.*—Instances have been known in which the Providence Pine-apple has attained the weight of 14 lbs. The Trinidad is stated to grow to a larger size, but of that we are not certain. They are both good kinds. The latter is rather scarce at present, but the Providence may be obtained of any respectable nurseryman.—‡

Paulóvnia imperialis.—*Gamma.*—You need not protect this; it is perfectly hardy.—‡

Vermin.—*Castanea* asks if there is any means of preventing the nuts of the Spanish Chestnut when sown in the natural soil from being devoured by squirrels and mice. Soaking them in lamp-oil smelling strongly of turpentine (qu. naphtha ?) failed, he says, to preserve them last season, not more than half-a-dozen having escaped out of thousands. We do not believe this can be remedied except by trapping the animals. The instinct with which these little creatures are endowed by Providence must necessarily baffle all human attempts at counteracting it. An excellent vermin-trap for the field is described at p. 126; with the best method of catching squirrels we are unacquainted. Of course the latter animals, as they do not burrow, might be kept off by wire netting; but it would be an expensive remedy.—†——*O. W.*—We know of no practicable method of preventing rabbits barking young Hollies except destroying them.—†

Chinese Iris.—*A Dabbler* had better now allow his Chinese Iris to go to rest, by withholding water, except in very small quantity; in the spring, when it again begins to move, give it more water gradually as the warmth increases.—†

Gardeners.—*A Dependent Independent* is precisely the sort of person that ruins the cause of gardeners. He had much better go to America, where servants are masters, than stay here. He is quite right in anticipating that we have no intention to "defile our pages with his rubbish," to make use of his own appropriate language.—†

Early Flowers.—K. Π. Σ.—The principal hardy plants which flower between the beginning of December and the end of February are, Eranthis hyemalis, Helleborus niger, H. atrorubens, Anemone coronária, Hepática triloba, Tussilago fragrans, the Snowdrop, and Primrose: the latter five in favourable seasons only. If you possess a wall, you may, with a little protection, preserve Chrysánthemums in bloom until Christmas; and after that period Chimonanthus fragrans and Pyrus japónica will flower.—‡

Chemistry.—*F. R.* may read with advantage the excellent papers on rural chemistry already published in the *Chronicle*; or, in a few weeks, may procure those contributions to our columns in a separate form, with many additions and improvements; or, if she cannot wait, then she had better procure Johnston's Elements of Agricultural Chemistry.—†

Shrivelling of Grapes.—*J. R.*—You state that you have two vineries, one forced early, whilst the other is not forced at all. The Vines in the first house look well, until the period of colouring arrives, when they either shrivel or shank off; whereas those in the late house are not at all affected. The border in front of the house is only 2 feet wide, but you omit to state whether the roots are confined by a wall, or whether they run under a walk. In the absence of further information, it is impossible for us to say from whence this shanking arises; as it only appears in the early house, we are of opinion that it does not originate in the border, but that it is caused by your having over-forced your Vines, which cannot fail to become weak if forced early for several years successively.—‡

Conservative Wall.—*A Well-wisher.*—In answer to your question, Mr. Paxton informs us that you are misled in your idea of the conservative wall represented in the *Chronicle* of May 21, by having overlooked the circumstance that only a *small portion* of a long line of wall is there shown. The engraving being intended to represent the middle compartments of a long range, the two furnaces are introduced on the supposition that the range is continued to a considerable extent, both right and left—of course, one furnace would be sufficient with short lengths. Two sashes are not intended to meet behind *one* projecting wall, but all of them are to pushed *one* way, and each behind the projecting wall next to it; that is, there must be a projecting part for the enclosure of each light. The pillars may be either of stone or brick coated with cement. The plants are put into the *ground* (not into pots) in the compartments marked *b*, *b*, *fig.* ii., and trained to the wall trellis. The covering that might be used outside of the sashes in rigorous weather would be close-wove canvas, stretched on frames, and sliding behind the projecting walls, in front of the sashes, when the recesses were open. Each pane of glass between the bars should be 7 inches wide, and the height in three lengths of 3 feet 9 inches each. Glass of this description is made in Birmingham expressly for horticultural purposes.

Manures.—*Burnham.*—If your Grass-land is in good order, you may apply the contents of a cesspool to it at this time; but no kind of manure will be so advantageous to it as it might be, if the land is not previously well drained. It will be desirable that you should fix the ammonia by means of very weak oil of vitriol, which must be introduced into the tank some days before the contents are removed.—†——*J. G. H.*—Clarke's Aimatic Compost is a subtance with whose action we are unacquainted. It was used with advantage in a vine border in the Royal Forcing Gardens at Kew three or four years since, but has not been tried since that time. Where gas-water is poured upon leaves, grass-cuttings, and similar refuse, it causes them to ferment violently, and to run into rapid decay. A barrel of the liquid will probably be enough for 50 barrow-loads, but that will depend on its strength. The mixture will produce an intolerable smell, which had better be prevented by the addition of a little bleaching powder.—†

Soil.—*A Hanoverian.*—As most kinds of soil contain iron, and some, such as loam, a great deal of that metal, you cannot suppose that it is injurious to vegetation, except in a particular state, or in very large doses. The German chemist John found that Barley and Hemp would even grow in earth consisting of iron rust. Pump-water is not unfit for vegetation because of the iron it contains, but on account of the presence of other mineral matters, which vary with the earth through or from which the water passes.—†

Air-plants.—*F. R.*—All Air-plants are not Orchidaceous; many are Bromeliaceous, or of the Pine-apple tribe; even some kinds of Figs, and Mosses and Lichens, are really of that nature, for they derive their food principally from the air.—†

Gourds.—*Hibernia.*—The Gourd which attains the largest size is the Potiron jaune. The usual way of raising it is, to sow the seeds about the beginning of April in pots, which are afterwards plunged in a hotbed. When the young plants are coming into rough leaf, they should be potted off singly, and after allowing them to remain in the hotbed for a few days they should be gradually hardened off. As soon as all danger of frost is over, they may be planted out in a warm part of the garden.—‡

Orchard-trees.—*J. Battle.*—As the subsoil of your paddock is tenacious clay, unfavourable for fruit-trees, it would be advisable to subtrench and drain it. A broad mound should be formed, and the trees planted almost on the surface of it; for although a small one would cover the roots sufficiently, yet the slope of it being more abrupt, the rain would in consequence run off beyond the extremities of the roots of recently-planted trees. The best time for planting it is as soon as the leaves have fallen. The varieties enumerated at p. 641 are all good in their respective seasons; and they are set down very nearly in the order of their ripening; so that if you think proper you can omit the early varieties first mentioned—for example, the first 5 Apples and 6 Pears. You may add to the list of Apples the Downton Nonpareil, Cockle Pippin, and Baxter's Pearmain; and as Kitchen Apples, Dumelow's Seedling, Brabant Bellefleur, Hormead Pearmain, Mère de Ménage, Rymer, Waltham Abbey Seedling, and Stony Royd Pippin. By thus increasing the number of varieties, you have a greater chance of obtaining some that will prove suitable to your soil. To the list of Pears given at the page above referred to, you may add as late sorts, the Fondante du Bois, Jean de Witte, and March Bergamot; and for stewing, Francréal d'Hiver and Flemish Bon Chrétien. **Medlars**: Nottingham and large Dutch. **Nuts**: Red Filbert, White ditto, Cosford, Spanish, Cob Nut, and Frizzled Filbert. **Walnuts**: the Double and Single. The Breda Apricot is the best for standards; it bears abundantly in favourable seasons, and although the fruit is not large, it is not wanting in flavour.—‖

Hardy Peach.—*H. C.* forwards a Peach, with a statement that it is from a tree in an exposed situation, where it grows and bears like an Apple-tree; it was raised from a stone 14 or 16 years ago. The fruit is well coloured, and like a Royal George, but somewhat smaller; the flesh is perfectly melting, and parts freely from the stone. The flavour, notwithstanding the late period of the season, is good. It would be desirable to know whether the tree has previously borne; whether the leaves have glands; and whether the flowers are large or small. It appears to be highly deserving of cultivation.—‡

Law of Gardens.—*An Old Subscriber.*—It is illegal for a tenant to remove roots or other plants growing in the soil, or to take away Greenhouses, without the consent of the landlord; unless some special agreement shall have been made when the occupancy began.—†

Thunbe'rgia alata.—*A Constant Reader.*—This plant will live for several years, if repotted from time to time as it may require. It will be strengthened, by being cut back to a healthy shoot when it is potted early in spring.—‡

Greenhouse Climbers.—*A Constant Reader.*—The following are handsome Greenhouse Climbers, and are not expensive:—Hardenbérgia digitata, Kennédya racemosa, Zíchya villosa, Z. pannosa, Tacsónia pinnatistípula, Passiflora onychina, Sóllya linearis, Ipomœa Leárii, and Mandevilla suaveolens.—‡

Achimenes.—*J. L. S.*—The following plants are nearly allied to, and require the same treatment as, Trevirana coccínea: Achimenes longiflora, A. pedunculata, A. rósea, Niphæa oblonga, Gloxínia rubra, and G. caulescens.—§

Miscellaneous.—*J. L. S.*—Your soil from an old cesspool is apparently of excellent quality. We should use it for all gardening purposes with confidence. Will you be so obliging as inform us hereafter of the result of its employment?—†——*Flora.*—Your plant is Goldfússia anisophylla.—†——*Curious.*—To obtain an estimate of the expense of heating a Vinery by hot water, you must apply to those persons who execute such work.—‡——*Gamma.*—It is impossible for us to say when you may expect your seedling Honeysuckles to flower. There has not yet been sufficient time for proving the experiment which you mention.—‡——*H. G. B.'s* Caterpillars will produce a species of saw-fly, named by St. Fargeau, Nematus grandis.—*R.*——*J. B.*—Your seedling Fúchsia, like too many others, is not sufficiently distinct to be worth general cultivation.—‡——*A Reader.*—The fruit of Pyrus japónica is not poisonous.—†——*A Subscriber.*—The leaf appears to be that of Acácia Julibrissin, which is half-hardy only.—†——*Ignoramus.*—The change in colour of the Phlox will occur daily as long as the flowers remain expanded, provided the explanation we have given is the true one.—†——*C. B.*—Your heating apparatus is very defective. It would be far better to have a double pipe, with its curved junction in the fire, and the two open ends in the trough, one at the bottom, the other at the top. We do not anticipate danger from bursting at *B.*—†——*D. S.*—Your Pears are, 1, Bergamotte Cadet; 2, Ne plus Meuris; 3, La fortunée de Parmentier; 4, Passe Colmar; 5, Winter Nelis; 6, 8, Glout Morceau; 7, Forelle; 9, Beurré Diel.—‖——*W. H., Berks.*—The Pears are, 1, Catillac; 2, Vicar of Winkfield, in your neighbourhood; 4, Autumn Bergamot. The Apples are, 5, Cornish Aromatic; 6, Franklyn's Golden Pippin.—‖——*C.*—The Early Manly and Lady's Finger are both good Potatoes to succeed the Ash-leaved Kidney. The former is round; the latter, kidney-shaped.—‡——*Ignoramus.*—Your Verbenas arrived in a wretched condition; from what we could see of them, they do not appear to be so good as many others of several years' standing.—‡——*J. G.*—Of your Apples, No. 1 is Kentish Fill-basket; 4, Northern Greening; 9, Newtown Pippin; 13, Belle Harvey; 14, Norfolk Beaufin; 16, Yorkshire Greening; 22, Blenheim Pippin; 24, Royal Russet. The Pear is the Brown Beurré.—‖——*J. W. N.*—Your Pears are, 1, Colmar; 2, Napoléon; 3, Marie Louise; 4, Beurré de Capiaumont; 6, Beurré Diel; 7, Passe Colmar; 8, Beurré Rance; 9, Brown Beurré; 10, Passe Colmar.—‖——*G. S., Hants.*—Your Pears are, 1, Beurré Knox; 3, Passe Colmar; 4, Beurré Diel; 5, Colmar; 6, Bishop's Thumb; 7, Glout Morceau; 8, which you mention as growing in clusters, is the Seckle; 13, Brown Beurré. The Apples are, 2, Miller's Glory; 11, Paradise Pippin; the names attached to the others appear to be correct.—‖——*Y. X.*—Your Pears are, 1, Black Achan; 2, is in some collections called Délices d'Hardenpont, but is not the true sort; 3, Easter Beurré; 4, St. Germain; 5, 13, Chaumontel; 6, 10, Passe Colmar; 7, Winter Bon Chrétien; 8, Gansell's Bergamot; 9, Glout Morceau; 11, Spanish Bon Chrétien; 12, Uvedale's St. Germain; 14, Brown Beurré; 15, Beurré d'Aremberg; 16, Gilogil; 17, Crassane; 18, Beurré de Capiaumont; 19, Beurré Diel; 20, Beurré Knox; 21, Marie Louise.—‡——*Mayle & Co.*—Both your rose-coloured Dahlias are promising; the bloom marked 25-42 is imperfect, and confused in the centre, which, however, is well elevated. 17-42 is better coloured than the former; the petals are of a good form and well arranged, but the centre is rather too depressed: both these Seedlings are worth trying another season. No. 1, the petals are too quilled as they approach the centre, which appears thin. Essex Triumphant, which will be sent out next season, is so superior in every respect, and deeper in colour, that your flower will be useless. The Pansy is pretty in colour, but the form is imperfect from the under petals being disproportionately small.—*——*M. P.*—If he wishes for an answer, will be pleased to express himself in proper language. Insolence is unbecoming in any one, especially in illiterate persons seeking for information.——*E. S.*—Your Apple *is* the Ribstone Pippin.—‡——*J. G.*—The Seedling Sálvia which you have raised from S. splendens is of a pretty light colour, provided it continues constant. The Cyclamen is the common autumnal white. No. 3 is Alstrœméria psittacina, and 4 is Alonsoa incisifólia.—‡——*J. R.*—You will find a full account of the manner in which cider is made at p. 71 of this year's *Chronicle.* Your question respecting Tomato Ketchup shall be attended to next week.—‡——*Subscriber.*—There are traces of some mining insect upon your Beech leaf, but of what kind we cannot state without seeing it. Your Poplar is infested with a parasitical fungus of the same nature as the rust of the Rose. It will do no harm.—‡——*G. H. M.*—Your Seedling Fúchsias are certainly pretty, but there is a sameness of colour in all of them, which wants to be got rid of. No. 1 is decidedly the best. Several of the blooms were shaken from the stalks in the carriage.—‡——*B. H.*—Your Pears are: No. 1, Napoléon; 2, White Doyenné; 3, Easter Beurré; 4, Calebasse (not the Calebasse or Beurré Bosc); 6, Passe Colmar; 7, Beurré Diel; 9, Seckle; 10, 13, Glout Morceau; 11, Easter Beurré, 12, Chaumontel. The Apple is the Dutch Mignonne.——*Mr. Rickett's* Pear is undoubtedly the true Beurré d'Aremberg. It does become brown occasionally on standards, and is then very superior to the smooth fruit grown against walls; in fact, not like the same variety.—‖

A Practitioner, Peter R., Mr. Hayward, Mr. Rogers, shall find insertion as soon as we can possibly get a little space.

Mr. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3*d.* each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5*s.* for every 25 copies.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

The telegraphic despatch, in anticipation of the Overland Mail, reached town yesterday morning, and the details have since arrived by express. The intelligence both from Affghanistan and China is of a favourable kind. It states that orders to advance were sent to Gen. Nott on the 29th of July; that his brigade, which was in the finest order and thoroughly equipped, immediately left Candahar on the road to Ghuznee, and that a simultaneous movement upon Cabul was intended to take place from that fortress and from Jellalabad in the beginning of September. Intelligence of a satisfactory nature had been received from Lady Sale and the other prisoners, who continued to receive humane and respectful treatment. Gen. Pollock occupied his former position, and Sufter Jung had surrendered himself to the British forces at Candahar.—The accounts from China come down to the 9th June; the troops have taken Chapoo, but sustained a severer loss in the action than they have met with in any previous operations in China.—The French papers have discovered another ground for animadversion against England, in the recent detention of a French merchant vessel by a British cruiser on the Coast of Africa, under suspicion of being a slaver. It appears that the commander of the cruiser fired two shots at the French vessel before she hove to, and that two officers boarded her, and after some conversation with the crew and passengers, allowed her to proceed. The French captain admits that his vessel was not searched; but, notwithstanding this avowal, he makes an extraordinary series of charges not only against the English ships, but against the English residents on the coast. All these statements are implicitly believed by the Paris papers, which renew their attacks upon this country, and call for the immediate revocation of the treaties for the right of search.—Accounts from Spain mention that the approaching birthday of the Queen has given rise to discussions on the propriety of continuing the Regency, or of considering the Queen's majority as commencing at the early age of twelve, the period fixed by the Old Constitution. The question assumes great importance, and it is thought probable that the Cabinet will find it necessary to convoke the Cortes, for the purpose of bringing it to a settlement.—From Germany we learn that the Convocation of the delegates of the German Customs Union has broken up, and that the attempt to raise the import duties on British manufactures has entirely failed.—By the Levant mail we have late intelligence from Turkey and Egypt; fresh disturbances have taken place in Syria, occasioned, it is said, by the encouragement given to the disaffected by the presence of the English and French squadrons. From the Danube we have a confirmation of the rumour that the family of Prince Milosch has been deposed; the son of Czerny George has been publicly acknowledged as the new sovereign, and the name of that celebrated chief has recovered its ancient popularity throughout Servia.—An arrival from the United States has supplied us with recent advices from New York, but the settlement of the questions at issue with this country and the rising of Congress deprive them of their usual interest for the English reader.]

At home, the special commission for the trial of the prisoners concerned in the late riots has been opened at Stafford and at Chester. Several parties known as active leaders of the Chartist movement have been arrested since our last, and on no occasion in recent times has so large a number of offenders been sent to trial. As far as the proceedings have yet gone, the address of the Chief Justice Tindal to the Grand Jury at Stafford, which will be found in our Law Report, is their most remarkable feature; it contains a comprehensive exposition of the common law of England on the different questions connected with the riots, and will doubtless be read with great attention.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal, are quite well, and continue at Windsor. During the week Prince Albert has enjoyed the sports of the field in the Great Park. On Saturday his Royal Highness came to town, to attend a meeting at the office of the Duchy of Cornwall.—The Queen Dowager left town on Tuesday by the South-Western Railway for Canford-house, Dorset.—His Imperial Highness the Archduke Frederick of Austria visited St. Paul's on Monday, and left town on Tuesday on a visit to Sir Robert Peel, at Drayton Manor. The Archduke left Drayton on Thursday, on a visit to the Duke of Devonshire, at Chatsworth; and is expected to leave Chatsworth this day for Wynyard-park, the seat of the Marquis of Londonderry.—The following changes have taken place in the Royal household during the week:—Colonel Arbuthnot has succeeded Major-General Wemyss as Equerry to the Queen, and Major-General Sir E. Bowater has succeeded Colonel Bouverie as Equerry to Prince Albert.

Gazette Announcements.—The Queen has been pleased to appoint Mr. James Walker to be Secretary and Clerk of the Council, and Remembrancer of the Court of Exchequer, in the Island of Barbadoes; Mr. J. A. Allen, to be Treasurer of the Island of Trinidad; Mr. F. P. Bedingfeld, to be Treasurer of the Island of Dominica; Mr. J. Montagu, to be Secretary to Government in the Colony of the Cape of Good Hope; Mr. J. E. Bicheno, to be Colonial Secretary in the Island of Van Diemen's Land; Mr. F. Seymour, to be Assistant Colonial Secretary in the same island: Lieutenant Moriarty, R.N., to be Port Master in the Colony of New South Wales; the Rev. John Earle, to be Chaplain of her Majesty's Settlements on the Gambia; and Mr. James Hood, to be Commissioner of Arbitration in the Mixed Commission Courts at Sierra Leone for the suppression of the Slave-trade. Sir James Graham, as Secretary of State, has appointed Mr. Rutherford Alcock and Mr. John Bacot to be Inspectors of Anatomy in England and Wales, and Dr. Andrew Wood to be Inspector of Anatomy in Scotland.

The Army.—The Queen has been pleased to appoint General Sir Robert Thomas Wilson to be Governor and Vice-Admiral of Gibraltar. The Duke of Wellington, as Commander-in-Chief, has promoted to a brevet majority Captain Smith, of the 27th Regiment, for his gallant resistance and defeat of the rebel Boers of Port Natal.

Law Appointments.—It is understood that the bankrupt commissioners, including the new officers who have been appointed, will assemble in a few days, to agree to certain rules for carrying the provisions of the new act into effect on the 11th of next month. The names of the new commissioners are stated in legal circles to be—Mr. Sergeant Stephens, Mr. David Pollock, Mr. Horace Twiss, Mr. Shepherd, Mr. Wray, Mr. Kenyon Parker, Mr. H. R. Reynolds, jun., and Mr. Charles Phillips. The present Judge of the Court of Review (Sir John Cross) will receive a salary of 2,500*l.* a year, the London commissioners 2,000*l.*, and the country commissioners 1,800 a year each.

Income Tax.—The daily papers have published the following extract from a Birmingham paper relative to the operation of the Income Tax on beneficed clergymen who pay salaries to curates:—"A clergyman, having the assistance of three curates, wrote to the office of stamps and taxes, requesting to know 'whether, in the returns to be made under the Property-tax Act, their salaries were to be deducted.' The reply was as follows:—'In answer to your letter, I am directed by the board to state, that the salaries of curates can only be admitted as a deduction in the returns made under the Property Act in those cases in which curates are licensed by the bishop at a fixed stipend.'"

Foreign.

FRANCE.—*The Right of Search.*—Another grievance in connexion with the right of search supplies the French journals of all parties with an abundant theme of animadversion against England. It appears that the English cruiser Cygnet, off the coast of Africa, fired a shot ahead of a French merchantman, L'Aigle, who was evidently seeking to avoid the annoyance and delay of search. A second shot was fired, on the merchantman not heaving to, which, the captain says, grazed his vessel; but he admits that the officers who boarded did not search the vessel, but merely spoke to the passengers. The following is the account given by Captain Brice of the Aigle:—"He arrived before Galinas in March, and could not trade, the English having invaded the country. They (the English) burned factories, and everything; bought 172 negroes to transport to the Gambia; pillaged the habitation of the Portuguese ex-Governor, and shot his daughter! No canoes of natives appeared, the English being in the habit of firing at all. Captain Brice left Whyda July the 6th, with a full cargo of palm oil. He was trying to double Cape Formosa, when he was boarded by an English cruiser. He hoisted the French flag, when a cannon shot was fired at him. He drew in his sails, when a second cannon shot almost hit his vessel. He stopped, and was soon boarded by two Englishmen out of uniform, who, instead of searching the ship, went down into the cabin, and began to converse with the crew and passengers. Having thus kept me two hours and a half (he says), they left me at liberty to proceed. One of the English officers was drunk. The cruiser was the Cygnet."—The French journals also publish a reply of Lieut. Wilson, of the Cygnet, to the protest of the French captain. He says he had learnt that several vessels had taken up slaves at Whyda, under the French flag, and he felt it his duty to search every vessel that came from thence. He had fired a shot to make the vessel stop, and wait for him, as the night was approaching. He suspected the vessel to be Spanish or Portuguese, and considered it evident that all vessels trading at Whyda, which is the most notorious depot for slaves, ought to be necessarily suspected of being engaged in the slave-trade. —*La Presse* contends, that after the details published by the captain of the French brig, of the outrage committed by the British cruiser whilst exercising the right of search, it becomes impossible to continue to enforce the treaties of 1831 and 1833, without the greatest danger of a collision taking place between those who exercise the right of search and the parties who only submit to it with reluctance. "It is therefore urgent," it says, "to revoke those conventions. The treaty lately concluded by Great Britain with the United States is an ulterior argument which France may invoke with success." The republican *National* avails itself of the circumstance to renew its attacks upon this country, and says that "England never before so violently revealed her determination to domineer absolutely on the seas as an indispensable condition of her existence." The *Constitutional* sees in it the commencement of a plot for driving the French from the west coast of Africa altogether. The *Courrier* takes for granted the burning of villages, pillage of habitations, and firing at canoes, attributed to the English by the French Captain, and adds that all these abominable acts were merely for the purpose of disquieting French commerce, as if there were nothing but French commerce in Africa, and none but French ships on the ocean. Such is the present temper of the public mind, that nothing can take place in the wide world but it is done out of spite to the French.

The Provinces.—The letters and journals of the South of France are filled with accounts of the inundations of the rivers of Provence, Dauphiné, Bresse, and Vivarais. The Paris journals refer to these deplorable ravages occasioned by the late rains, and state that they produced in various districts inundations unequalled in extent since the year 1812. In several of the wine districts, those of the Rhone particularly, the vintage had been nearly destroyed.—The railroad from Paris to Rouen is expected to be completed by about the 1st of March. This will be very expeditious, as two large tunnels have to be formed, and the line will be 30 leagues in length. Nearly 12,000 workmen are employed upon it. A meeting of English shareholders has been held at Liverpool, pledging themselves to support the extension of the line to Havre. The Ministerial papers state that no contractor can be found to execute any portion of the Belgian line of railroad. It seems that in the present state of the French money market, no company can be found to execute the line. They also admit that the Government engineers are so imperious, and so difficult to please, that all the contractors for the fortifications of Paris have become bankrupts; and the exorbitant rate to which those works have raised the price of stone and labour leaves no hope for the railroads. It is now stated that, since no contractor can be found, the Government must set about the execution of the line itself.

The Capital.—Ministers are successively returning to Paris. Marshal Soult reached that capital from Eu last week; M. Duchatel has since arrived; and M. Guizot has removed from his summer residence at Auteuil to the Hotel of Foreign Affairs.—The King, Queen, and Royal family arrived at St. Cloud, from Eu, on Sunday morning. His Majesty appeared to enjoy excellent health, and at 1 o'clock presided at a Council of Ministers.—We learn from the *Moniteur* that, after an absence of 20 years, employed in exploring India, M. Diard, one of the most distinguished pupils of Cuvier, has just returned to Havre, bringing with him a great number of curious objects, intended for the Museum of Paris. He succeeded besides in procuring 30 barrels of the black varnish so useful in colouring china, and of which the Chinese had hitherto carefully concealed the secret. M. Diard has likewise imported from Java a number of new plants, which, owing to the extraordinary care taken of them, supported the long passage from India without suffering the least alteration.

Algeria.—Intelligence of an unfavourable character has been received from Algiers, which shows, that so far from the Arab tribes being completely subdued, as announced in the French papers, Abd-el-Kader and his confederate chiefs are still full of energy, and more than equal to the military skill of the French commanders. It appears that General Changarnier, a highly-distinguished officer, had marched to the western frontiers of the province of Oran, and invaded the territory of some tribes which had not yet been visited by French troops, where he experienced a most vigorous resistance from their warlike population. The Arabs fought during two days with a courage amounting to heroism, and are supposed to have sustained considerable loss. In these conflicts the French confess to have had 150 men killed and wounded, including six officers killed, and among others Lieut. Sebastiani, nephew of Marshal Sebastiani.—It is said to have been accidentally discovered at Algiers, that the fruit of the fig cactus, a plant that grows there in immense quantities, contains such an abundance of saccharine matter, that the heat of the sun is sufficient to crystallise the sugar. General Lamoricière, the commandant of Maskara, has ordered some of the crystallised matter to be collected, which, on a closer investigation, was found to be of remarkable purity and excellence. It has since been calculated that the abundance in which the plant exists, and the low price at which the fruit is sold, would allow sugar to be manufactured from it in large quantities, at about 2*d.* a pound.

SPAIN.—Accounts have been received from Madrid to the 27th ult. They refer chiefly to the rumoured retirement of the Minister of Justice, and to the reported dismissal of Gen. Zurbano from his command in Catalonia, on account of his conduct towards M. Lefevre, the French manufacturer of Girona.—Gen. Van Halen has published a circular, which has caused much sensation in the capital, as it is equivalent to a declaration that the Government is not in a position to meet the expenses necessary for the maintenance of the army in Catalonia.—The Ministerial papers state that the Government has come to no decision on the subject of the convocation of the Cortes, or of the new elections. The most serious question likely to agitate the new Cortes is, whether the young Queen is to enter upon the difficult task of governing and choosing ministers at the early age of twelve appointed by the constitution, or whether it may not be thought advisable to extend the Regency. Any attempt of this kind is expected to meet with opposition, not only from the Moderados, but from the original partisans of a triple Regency.—Letters from Malaga state that some English capitalists are on the eve of purchasing considerable landed property in Andalusia.

PORTUGAL.—We have little news by the last arrival from Lisbon. Nothing has been decided in regard to the tariff, and the British shipping in the Tagus can procure no freights. The wine-merchants withhold their consignments in the expectation of a decreased duty, and the commerce of both nations seems entirely at a stand.—The claims of Colonel Rose, on behalf of the British officers who served in the Peninsular war, are likely to be immediately liquidated.—Previously to the dissolution of the Cortes, a project was presented by Signor Mousinho d'Albuquerque, signed by a number of Deputies, containing the necessary measures to be adopted for the immediate forming of roads throughout the kingdom, as the means of increasing the public revenue, by giving a stimulus to commerce, and of facilitating the transport of detachments of troops to all parts of the country, for the suppression of robberies and depredations of the most heinous nature, of which every day furnishes accounts. The papers state that should the plan be carried into effect, and not left to perish as a mere project, it will, perhaps, be no exaggeration to say, that it was the only measure of a patriotic character entertained by the Chambers during their recent sitting.

GERMANY.—It is stated in the daily papers that the convocation at Stuttgardt of the delegates of the German Customs Union has broken up, that the attempts to raise the import duties on British export articles have failed, and that consequently these rates remain unaltered for at least three years to come. The most important of these articles are cotton twists, the total imports of which into the Germanic Union from Great Britain amounts annually to 54,000,000 lbs. weight; and iron, of which the quantity now exported from Scotland far exceeds the general estimate.—The German Agricultural Society held its first meeting at Stuttgardt on the 22d ult., the Privy Councillor Gœrtner in the chair. More than 500 members were present. M. de Gœrtner informed the members that the King took a warm interest in the proceedings of the society, and in all matters relating to the improvement of agriculture. Dr. List, of Augsburg, proposed that a committee should be appointed to collect information as to the different systems of agriculture pursued by foreign nations. In the course of his speech, Dr. List alluded to the fatal effects which the British colonial protective system might have on the producers of corn, flax, and wool, throughout Germany. After a long debate the motion was carried.—The German naturalists have held their meeting this year at Mayence, which city has been unusually gay, in consequence of the almost simultaneous occurrence of the military manœuvres in the neighbourhood, and of the great exhibition of the various specimens of German national industry. At their second sitting, on the 21st ult., the naturalists fixed upon Grätz as their place of meeting for 1843. As soon as the proceedings of the naturalists closed, a large portion of them proceeded to Strasbourg, to attend the French Scientific Congress, appointed to assemble in that city. —*The Prussian State Gazette* announces, that the population of the Prussian Monarchy, which in the year 1816 amounted only to 10,349,000 inhabitants, increased in 1840 to 14,928,500 individuals, which are divided as follows:—Eastern Prussia, 1,393,790; Western Prussia, 916,382; giving for Prussia Proper a return of 2,310,172; Posen, 1,233,850; Brandenburgh, 1,857,097; Pomerania, 1,056,494: Silesia, 2,858,820; Saxony, 1,637,220; Westphalia, 1,383,197; Rhenish Provinces, 2,591,650.—It is announced in the Leipzig papers that the treaty of commerce between Austria and Great Britain, which has been for some time under consideration, is about to be concluded, Prince Metternich having agreed to the principle. The existing duties on the importation of British manufactures are to be considerably reduced. It was likewise expected that Austria would enter into an arrangement with the German Customs Union.—We learn by a letter in the *Journal des Débats* that the municipality of Vienna has just caused an establishment to be made, the first of its kind ever formed in Germany. It is a swimming school for winter. This establishment is made of red marble; 163ft. long, and 46 broad; covered with a glass vault, supported by eighteen columns of the composite order. In the middle is the basin, 122 feet long and 40 broad; the sides are lined with plates of delft, behind which are iron tubes, which, being heated, give the water a summer heat. All round the room there are two rows of small cabins for the bathers, which are also heated. Twelve gas lustres are hung from the ceiling, and will be alight till eleven at night. This edifice has been built by M. Etzel, architect of the King of Wirtemberg.—The new post convention between Austria and Bavaria came into operation on the 1st of this month. There are no longer any frontiers, as far as postage is concerned, between Austria and Bavaria. All letters are posted from the place of departure at 6 kreuzers for 10 German miles, and 12 kreuzers for every distance greater: 4 kreuzers more per letter is given for the letters from the Palatinate, and consequently from France and England.

ITALY.—Accounts from various parts of Italy give a melancholy description of the ravages caused by severe storms of wind and rain. On the 20th ult. a violent hurricane swept over Rome, which tore up the trees by the roots, and damaged many of the public buildings.—As we mentioned in our last, the Pope has visited the port of Civita Vecchia, where he took a short cruise at sea on the 19th ult., and visited the Dante, French Government steamer. This vessel had just entered the harbour when his Holiness was sailing out in the brig-of-war of 12 guns, the St. Peter and St. Paul, escorted by the three small steamers lately constructed for his service in England. The Pontifical flag was immediately hoisted on board the French steamer, and a salute of 21 guns was fired. Two hours afterwards the Sovereign Pontiff, accompanied by a numerous suite, composed of cardinals, prelates, and superior officers, repaired on board the Dante. The Pope, after visiting the vessel, conversed a long time with the officers of the Staff and the French Consul, commended the services rendered to religion by the Levant packets, who gave a free passage to missionaries and nuns of different orders, and extolled the virtues of Louis-Philippe and the piety of the Queen.

TURKEY AND SYRIA.—By the Levant mail, we have news from Constantinople to the 17th ult. No further change has taken place in the Turkish Ministry, and no event of particular importance has occurred since the last advices. The appearance of a combined squadron off the Syrian coast has produced a movement in the Lebanon. The mountain population, hitherto tranquilly submissive to the Turkish authorities, have been thrown into a violent state of excitement, and have already evinced symptoms of revolt. Mustapha Pacha attempted to seize some of the conspirators, but they escaped and took refuge on board the British and French ships.—Letters from the Danube confirm the account given in our last respecting the deposition of the family of Prince Milosch from the government of Servia. The cause of Prince Michael is now considered as lost. The small body of men who still continued to acknowledge his authority had been completely dispersed, and the name of Czerny George had recovered its ancient popularity throughout Servia. It is now said that it was the Princess Lubizca who governed the country, whilst she herself was the slave of favourites and priests. The reigning sovereign is the son of Czerny George, put to death by order of Prince Milosch, who sent his head to Constantinople — an act which has never been forgiven by the people of Servia. The new Prince calls himself Alexander Georgewolset Czerny. He has published a proclamation with this signature, which means to imply that he is henceforth merely the descendant of Czerny George, and not a Russian officer.

EGYPT.—Letters from Alexandria of the 16th inst. state, that the Egyptian fleet was still cruising off that harbour, and that Mehemet Ali intended to repair on board the Admiral's ship in a day or two, to be present at a sham battle. Ibrahim Pacha was expected daily. The Nile had broken through part of its embankment, and overflowed a number of villages in Lower Egypt. The damage, however, was soon repaired, the waters were beginning to subside, and there was every prospect the next crop would be as abundant as the last. It was said that the Pacha had authorised the East India Company to establish a line of telegraphic posts between Cairo and Suez.

INDIA AND CHINA.—The following telegraphic despatch, in anticipation of the Overland Mail from India, reached town at 2 o'clock yesterday morning. It arrived in Paris on Wednesday. The intelligence, so far as can be gathered from so brief a summary, appears to be satisfactory, although neither in Affghanistan nor in China has any decisive result been attained. The dates from Calcutta are to the 13th, from Bombay to the 27th Aug., and from Macao the 7th June. The despatch is as follows:—"Malta, Sept. 30.—The Oriental arrived this morning, bringing the following intelligence, extracted from the Overland Mail. Brigadier Monteith had gained several successes at Pesh Bolak, and in the Valley of Shurwarree. Satisfactory intelligence had been received from Lady Sale and the other prisoners. Colonel Palmer (the late Commandant at Ghuznee) was dead. General Pollock remained in the same position. It was reported that General Nott had received orders to march forward on the 29th of July, and it was expected that he would be before Cabul on the 6th of September. Sufter Jung had surrendered himself to the British forces at Candahar, and Colonel Wymer had destroyed several forts at the distance of 80 miles north of that place. Sickness continued to prevail in the different divisions of the Army.—From China, the last accounts are from Macao, and are dated June the 7th. Our forces had taken possession of Chapoo, and in so doing had suffered more loss than in any previous engagement in China. Very important news from that country is expected by the next mail."—The mail has since arrived by extraordinary express; the following are the leading facts:—General Pollock's force remains at Jellalabad, unable to advance for want of cattle, and nothing has occurred to diversify matters beyond some petty expeditions in the neighbourhood, and skirmishes leading to no result. Captain Troup, one of the prisoners at Cabul, came into Jellalabad on the evening of the 13th of July, accompanied by a chief of the Candahar tribe, who was sent to sound General Pollock on the subject of a negotiation. A number of letters were brought by Capt. Troup from the captives to their friends, thus affording a more accurate account of their position than we previously had. They are not at Cabul, but are confined in a fortress about five miles from it, the approach to which is by no means easy. They enjoy a considerable degree of liberty. Lady Sale botanises on the neighbouring mountains, in charge of two Affghan attendants, and the officers are often permitted to ride into the city. Indeed, if they were not bound by the thought of what might befal the ladies and children, they might effect their escape with little difficulty. The treatment they receive is kind and considerate to a certain degree. Akhbar Khan is always personally civil, and allows his captives great freedom of speech. Gen. Nott and his brigade, as stated by the telegraph, have left Candahar on their road to Ghuznee; and when they have reached that fortress, a simultaneous advance will take place from thence and from Jellalabad upon Cabul.—In regard to China, it appears that Chapoo, the great mart of the China trade with Japan, was captured on the 18th May. Colonel Tomlinson of the 18th and eight men were killed, and three officers and 45 men severely wounded. Sir H. Pottinger was still at Hong Kong, and was to proceed to the northward in a few days in the steamer Auckland. Nothing authentic had transpired as to the plan of the approaching campaign. Some are of opinion that the Yang-tse-Keang and the Great Canal are to be the points of attack, and not Pekin. Others, with perhaps greater probability, think that Pekin is the object at which the efforts of our troops are to be directed, where they will either frighten the Emperor beyond the great wall, or drive him into any compact we may dictate. At Tientsen, and all along the Peiho, from the sea to the capital, the Chinese have made great preparations for defence. The forts are reported to be more than a hundred in number, and the troops almost innumerable. The original sentence passed upon Lin, namely, banishment to Ele, "the cold country," has been carried into execution. Keshen has been banished to Mantchouria, and Elepu sent again to Chekeang.

UNITED STATES.—The Caledonia steamer arrived at Liverpool on Sunday morning from Boston and Halifax, with papers to the 17th ult. The settlement of the questions in dispute between Great Britain and the United States, and the rising of Congress, have deprived the papers of the interest which they heretofore had for the English reader. The correspondence between Lord Ashburton and Mr. Webster, which preceded the amicable settlement of the disputed points between England and America, is given in the papers. It is very voluminous, and of course forms the basis of the agreement entered into by the subsequent treaty, the facts of which have already been submitted to our readers. Various changes are reported in the Cabinet of Washington; amongst these the appointment of Mr. Cushing to the Treasury, in place of Mr. Forward, the resignation of Mr. Webster, whose place will be filled by Mr. Lewis M'Lane, and the resignation of Mr. Spencer in the war department, are the principal. The stoppage of the Great American Fur Company has been announced; their capital, which is of large amount, has been locked up in advances to the Indians, who procure them skins, and the vast accumulation of their stock this season, in consequence of the bad trade, has compelled them to suspend. It is said, however, that they will shortly be able to resume. The death of Mrs. Harrison, the wife of the late President, took place at the White House, Washington, on the 13th. Lord Morpeth had returned to Albany, and was going to visit Mr. Van Buren for a short time before his return home.

CANADA AND NOVA SCOTIA.—Sir Charles Bagot, Governor-General, opened the second session of the first Parliament of Canada on the 8th ult. His Excellency's speech on the occasion does not contain any matter of importance. It alludes to the treaty recently concluded between Great Britain and the United States, and augurs from the settlement of the disputed questions "the most favourable consequences to the province, in the maintenance of peace, the restoration of confidence, and the devotion of the undivided energies of its inhabitants to the internal advancement, and the development of the vast resources, of the country." Subsequent letters of the 13th ult. state that the House of Assembly was then engaged in discussing a motion of want of confidence, submitted to them as an amendment upon the address in answer to the Governor's speech. It was generally supposed that the motion would be carried; and few appeared to doubt that whatever might be the vote on this question, the government would be wholly unable to carry on the business of the Legislature.—The Halifax papers give some interesting particulars of a recent discovery made in the Sand-hills of Sable Island, in which numerous small houses built of ship-timbers were lately found. They contained numerous articles of melancholy interest connected with the history of the British troops of the reign of George II. Capt. Darby, near whose residence the buried houses were found, has published the following description of the discovery:—"The houses," he says, "are appearing at the base of a hill about two miles long, and 60 or 70 ft. high, lying parallel with the south coast of the island; the eastern end of which hill is about 55 feet high, covered with grass and other vegetation, about 35 feet below the surface, and 23 above the level of the sea: these houses appear as the sands wear away by the action of the winds. There appeared at times numerous bullets of lead, a great number of military shoes, parts of bales of blankets and cloths, brass points of sword scabbards, bees-wax, a small convex glass on both sides, a copper halfpenny of George II. dated 1749, some military brass buckles, a great number of brass paper pins, a very small dog's brass collar (with Major Elliot, 43d Regt., engraved on it), numerous bones (some whole and some broken), with the scalp of hair and head-dress of a young female, and a piece of gold band. There are three buildings, which seem to have been constructed of the fragments of some ship; they are situated about ten feet apart, in a triangular form, and are ten or twelve feet square."

WEST INDIES.—The Royal mail steamer Dee arrived at Falmouth on Tuesday, with the West Indian and Mexican mails. She left Jamaica on the 26th Aug., and Havannah on the 1st ult. She brings 500,000 dollars, 6 serons of cochineal, and 60 passengers. The yellow fever was raging severely at Havannah. At Jamaica, everything was quiet. Lord Elgin was gaining more popularity, and had gone with Lady Elgin into the country, for her ladyship's health. The House of Assembly would commence their session some day this month, and affairs were harmoniously proceeding between the Governor and the members. The sugar crop was expected to average about 60,000 hogsheads. The news from Texas is to the end of August. An expectation was felt, that through the joint interposition of the agents of Great Britain and the United States, a treaty of peace would be agreed on between Mexico and Texas, and a period put to the effusion of blood. The news from Mexico is unimportant. The expedition for the re-conquest of Yucatan promised to be a failure: many of the troops destined for the expedition had died of the fever. From Honduras, we learn that Nicaragua, and the other States who refuse to pay the indemnity required by Great Britain, are still blockaded. The delivery of the letters by this mail do not add much to the preceding intelligence: they mention, however, the interesting circumstance that a company of Royal Artillery has been formed at Jamaica, consisting exclusively of coloured natives of the West Indies, and it has been added to the 4th battalion of that Royal Regiment, for the purpose of acquiring a thorough knowledge of artillery exercises, and of doing duty instead of British soldiers.

Parliament.

HOUSE OF LORDS.

Thursday.—The Parliament met to-day *pro formâ*, and was further prorogued until Thursday, the 10th of November.—Shortly after 12 the Lord Chancellor, the Earl of Aberdeen, and Earl Shaftesbury, the Lords Commissioners, entered the House, but a little delay occurred in consequence of the commission not having arrived.

In the absence of Sir Augustus Clifford, usher of the Black Rod, and Mr. Pulman, deputy usher,

The LORD CHANCELLOR desired the deputy sergeant-at-arms, to request the attendance of the House of Commons, to hear her Majesty's commission for the further prorogation of Parliament read.—Mr. W. Lee, Second Clerk of the House of Commons, accompanied by the other clerks and officers of the House, then appeared at the bar, when the Royal Commission having been read,

The LORD CHANCELLOR said: By virtue of her Majesty's commission to us and other Lords directed, and in obedience to her Majesty's commands, we declare this present Parliament prorogued until Thursday, the 10th day of November next; and this Parliament accordingly stands prorogued until that day.

There was not a single member of either House present, except the three Lords Commissioners.

CITY.

Money Market, Friday.—The funds have improved to-day in consequence of the news from India. Consols for money closed 93 to ⅛; for the account, 93⅛ to ¼; Exchequer Bills, 2*d.* issue, 50*s.* to 52*s.* prem.; ditto, 2¼*d.* issue, 51*s.* to 53*s.* prem.; India Stock, 247 to 249; and India Bonds, 40*s.*

Metropolis and its Vicinity.

The Corporation.—The following is a statement of the income of the Corporation (exclusive of rents and interest on funded property) for the year 1841, together with the deductions therefrom, with a view of showing the amount to be returned to the Commissioners of the Income Tax:—Produce of renewing fines, 723*l.* 5*s.* 1*d.*; Markets, 9,023*l.* 2*s.* 10*d.*; Groundage on corn, 2,237*l.* 7*s.* 0½*d.*; Coal duties, 48,521*l.* 17*s.* 2*d.*; Metage duty on corn, 11,920*l.*; Office of gauger, 381*l.* 5*s.* 7*d.*; Office of stamper of weights and measures, 58*l.* 7*s.* 1*d.*; Brokers' rents, 3,892*l.*; Freedoms, 4,518*l.* 3*s.* 6*d.*; Sundry and casual receipts, 2,894*l.* 9*s.* 11*d.*: Total receipts, 85,069*l.* 18*s.* 2½*d.* *Deductions*—Salaries to officers, 37,416*l.* 10*s.* 6*d.*; Repairs of Guildhall, Mansion-house, prisons, &c., 5,379*l.* 17*s.* 6*d.*; Rent-charge upon Corporation Estate, 11,500*l.*; Police, 9,500*l.*; City of London School, 900*l.*; Drawback on coal duty, 1,190*l.* 10*s.*; Compensation for the abolition of the metage of coals, 12,981*l.* 19*s.* 9*d.*; Interest on moneys raised for making a new street from Holborn-bridge, 1,730*l.* 6*s.* 10*d.*; Total deductions, 80,599*l.* 10*s.* 7*d.* The balance of profits is, therefore, 4,470*l.* 7*s.* 7½*d.*, giving the sum of 130*l.* 7*s.* 8*d.* the amount of Income Tax, being *7d.* in the pound on the above balance.

The Sheriffs.—The new Sheriffs, Mr. Alderman Hooper and Mr. Pilcher, attended at Westminster Hall on Friday, according to the usual custom, to receive her Majesty's approbation of their election. The Lord Mayor, Aldermen, Recorder, and other city functionaries, accompanied them. The members of the corporation having taken their places, the usual address of the Recorder was delivered, to which the Cursitor Baron having replied, the ceremony of chopping sticks, counting 6 horse-shoes and 61 hob-nails, was performed by Mr. Alderman Thomas Wood, as the junior Alderman who has not passed the chair. In the evening the inauguration dinner took place at Vintners' Hall.

Public Meetings.—On Tuesday, the first meeting for the season of the members of the Society for promoting Christian Knowledge was held at their house, in Lincoln's Inn-fields. It was determined to present a memorial of esteem to the late secretary, the Rev. G. Tomlinson, D.D., who resigned on being consecrated to the new diocese of Gibraltar. The Rev. J. D. Glennie, M.A., minister of St. Mary's Chapel, Park-street, Grosvenor-square, has been elected in his place.

The Registration.—The case of most interest to our readers which has been decided since our last notice was that of Mr. Robert Taylor, which had been reserved for the Westminster Sittings out of the list for the parish of St. Clement Danes. Mr. Arnold, in giving judgment, said that the question was, whether Mr. Taylor occupied the house for which he was registered. Taylor was tenant, and let the whole of the house except the kitchen, in which he kept his gardening tools, he being a gardener. He had a key of the front door, giving him access to the kitchen; and he had also, exclusively, the key of the gate opening into the area, which likewise led to the kitchen. The objection was, that the occupation was not of the nature in which a house was usually occupied, and in support of the objection, the decision of the Great Marlow Election Committee, in Barnes's case, 1 Barron and Austin, 17, was referred to. In that case the voter occupied a house, garden, stable, and coach-house, but was registered for a "house" only. After the registration, and before the election, he let the house (with the exception of a bedroom and certain closets) as furnished lodgings, for three months, which expired after the election. He occasionally used the bedroom, but not to sleep in. His servant continued in the house during the three months, and her services were let with it. Possession was not given up by the lodger till after the election. The committee held the vote to be bad. Mr. Arnold considered this to be a strong decision, and, in the absence of any statement of the grounds on which it was founded, it was not easy to conjecture what they might have been. Possibly it might have been upon the ground of some supposed fraud, or that the occupation was merely colourable, as that appeared to have been the foundation of other similar decisions reported in the same volume, viz., Redman's case, p. 36; Kerby's case, p. 140; Latham's case, p. 152; and Clarke's case, p. 339. There were two other cases in the same volumes, in which the constructive occupation had been held to be sufficient. In Lee's case, before the Great Marlow committee, the voter was registered for a house, and it appeared the premises consisted of a house and shop, stable and garden. The daughter managed the business of the shop, and lived in the house, but the voter himself resided elsewhere. After the registration the daughter married, and she and her husband lived in the house without paying any rent to the voter, and the business of the shop was transferred to the husband, who was rated for the premises. Some of the voter's furniture remained in the house; he slept there occasionally, and he continued to make use of the yard and stable. The committee held that he continued to occupy the premises so as to be entitled to vote. The circumstances in the last-cited case (Lee's) were certainly distinguishable from those in Barnes's case, and the occupation of Lee was more perfect than that of Barnes; still it appeared to him (Mr. Arnold) that the same principle was sufficiently involved in both to render the decisions in some measure, at least, conflicting decisions. It was necessary, therefore, for him to look at the common law authorities on the subject. The position that the occupation of a part of a house by a tenant was, in law, the occupation of the whole, was established by the case of Rex *v.* Ditcheat, 9 Barn. and Cress., 176; and (notwithstanding the dictum of Mr. Justice Littledale in that case as to personal residence being implied in the term "occupation"), the subsequent case of the Queen *v.* St. Mary Kalendar, 9 Adol. and Ellis, 603, showed that an occupation by furniture or goods was sufficient. In that case Lord Denman expressly said, "that a man may occupy by a bale of goods." The occupation of a house need not, therefore, be an occupation as a dwelling-house or residence. It was possible, indeed, to conceive a case in which the occupation of a part of a house would be so utterly different from the purposes for which a house was usually occupied, that such an occupation might not be considered as a constructive occupation of the whole house; but here the tenant (Taylor) was by business a gardener. If he resided in the house, it was not improbable he would use the part where he now kept his tools for the same purpose. There was nothing, therefore, inconsistent with the occupation by the party of the whole house—there was nothing to show want of *bona fides*, or that the occupation was colourable merely. The name of Mr. Robert Taylor must therefore be retained.

Metropolitan Improvements.—The site of the late Lady Gordon's house, with the shrubberies attached to the late ranger's residence in the Green Park, are thrown open to the public; the new footpath, which has been formed through the centre of the ground, and other embellishments which have been in progress during the summer, being completed. The long-projected improvement of widening Piccadilly from Devonshire House to Hamilton Place has been postponed by the Commissioners of Woods and Forests until next year, as an Act of Parliament must be obtained to authorise it. The parish of St. George, Hanover Square, has consented to bear the expense of keeping the road in repair after the contemplated improvements have been carried into effect.—Mr. Cubitt is now making a new square on the Marquis of Westminster's Pimlico estate, to be called St. George's Square, extending from Besborough Place to the river. It will be 1170 feet wide, and 1213 yards long. He is also about to erect a chain pier at the foot of Vauxhall Bridge, for the accommodation of the steamers. The new road now making from the bridge to pass through the new squares in a line, will be opened to Albert Gate next month.—The repairs of the steeple of St. Martin's church will be completed in the course of next week, only 14 feet remaining to be erected. About 45 feet of the steeple were found to have been injured by the lightning, and had to be removed. The stones were very slightly decayed, though they had been exposed above 130 years.—An immense block of Dartmoor granite, the largest ever imported into London, was removed a few days since from Greenwich to Millbank, for the purpose of forming the lower part of the statue of the late king. Its weight is 30 tons. It was placed on a truck of iron weighing six tons, and was drawn from the wharf by 20 horses. The railway-bridge at New Cross was strengthened by shores during its passage, and it took upwards of six hours to remove the stone from the wharf into the street, the earth having sunk in several places from the weight.—Workmen are employed in the erection of iron railings on the Monument, for the purpose of preventing the renewal of the acts of suicide which have lately given it so painful a notoriety.

Southwark.—The approaching contest for the office of high bailiff of the borough, vacant by the death of Mr. Holmes, is expected to be a severe one. Mr. D. W. Harvey, the commissioner of the City police, Alderman Sir W. Heygate, Mr. Pritchard of Doctors'-commons, and Mr. Payne, the City coroner, are the candidates. It is expected that the salary will be reduced, but the report has not diminished the number of competitors.

Lambeth.—The contracts recently taken for the supply of provisions to the various parishes and unions of the metropolis for the ensuing six months have been considerably lower in price than those taken for some years past. In the parish of St. Mary, Lambeth, the contract for the supply of meat was 5*d.* the stone under that of the last six months, and the price of flour was 5*s.* less per sack. The effect will make a difference of about 140*l.* in the meat, and about 195*l.* in the flour; and taking into consideration other provisions, the saving to the parish will be about 400*l.* for the six months.

Kensington.—At an adjourned meeting of the magistrates of this division of the county, held on Monday, for the purpose of further revising the jury lists of the respective parishes, a discussion which had commenced last week was renewed, as to the import and use of the terms "gentleman" and "esquire." The first case which gave rise to the debate, was that of two persons residing in Ealing, who had been entered on the lists as "out of business." The magistrates said that this was no legal definition of a qualification, but the parish officers stated that they did not know how else to describe them; they had both been small tradesmen, and were now living on the rents of some small cottages. One of the magistrates, Mr. Tubbs, said the title of "gentleman" was, now-a-days, all moonshine. His definition of the term "gentleman" was, "a man having no visible mode of subsistence." After this lucid exposition, which embraces a much wider sphere than was probably meant, the parties were entered as "gentlemen." The other case was more complicated; a gentleman named Pitts, on the Chelsea list, applied to have his description altered from "gentleman" to "esquire," on the ground that he had been a captain in the St. James's Volunteers, and he laid before the bench his commission, signed by the late Duke of Portland, as Lord-Lieutenant of the county of Middlesex, in which he was designated as "James Pitts, Esq.," the designation preceding the appointment. It was contended on one side, in reference to this case, that when a person was once called esquire by the King, he remained an esquire during life; and it was argued, on the other hand, that a volunteer officer differed materially from all others, and would not be entitled to the designation, except on actual service. The question was put to the vote, when the numbers were equal on both sides, and Mr. Pitts declared that unless the magistrates made the alteration, he would move the Judges for a rule to compel them. The next case was that of Mr. Welsh, who had been a captain in her Majesty's actual service, but had sold out; in this case it was contended, in opposition to the claim of esquire, that when the commission was sold, all the honours pertaining to it were sold with it. At the meeting on Monday both these questions were again argued, and, after a good deal of argument, it was agreed that no amount of property would entitle the claimants to the title of esquire, but that persons once so styled by the sovereign in a commission of any kind, retained the title for life. It was stated that this was the opinion of the authorities at the Horse Guards, and both gentlemen were entered as "esquires." Another case then came on, in which Mr. R. Clarke, a retired civil servant of the East India Company on the Madras establishment, appealed against the alteration of his designation from esquire to gentleman. It was contended that the question of precedence in India had been settled by the Prince Regent, and that, as the claimant had risen to the rank of senior merchant, he was eligible to be called to the offices of the government, if the Company thought fit, and was therefore entitled to the dignity of esquire. After some discussion, a majority of the bench was in favour of the claim, and the name was retained on the list as an esquire.

Greenwich.—On Saturday afternoon his Imperial Highness the Archduke Frederick of Austria and his suite visited Greenwich Hospital, and honoured the Governor Sir R. Stopford with his company at luncheon. His Imperial Highness was received by all the officers of the foundation. The Archduke's gallantry in the recent naval operations on the coast of Syria had rendered his name famous amongst the pensioners, and they accordingly crowded to obtain a sight of so illustrious a member of their profession. His Imperial Highness inspected the various departments of the asylum, the chapel, hall, and naval school, the boys being mustered on parade to receive the Archduke with the usual honours.

Woolwich.—The recent experiments at the Mortar and Howitzer Battery have been unusually interesting in their results. On several former occasions details have been given of experiments made by order of the Admiralty with a composition invented by Mr. Jeffery, and called "Marine Glue,"—the object being to test its adhesive qualities and strength, as it was shown to be insoluble in water, and consequently invaluable if it proved of a strong binding nature when used for marine purposes, or in any of the naval departments. The experiments were conducted under the superintendence of Major Sandilands, in the presence of several scientific men, among whom was Sir I. Brunel. Several balls of hard wood joined together by the marine glue were fired from the mortar; but on examining the balls, no appearance of their having yielded or shown a tendency to separate by the violence of the concussion could be recognised. The fourth ball was joined together on the ground, and was fired within fifteen minutes to a distance of 750 yards without the slighest appearance of separation. After several experiments of the same kind, a sledge hammer was applied to one of the balls for some time, but without any other effect than shattering the solid wood. Sir I. Brunel expressed his astonishment to witness the immense adhesive power of the marine glue used openly in his presence; and the result of the experiments was so conclusive, that it was not considered probable that any others would be made.—On Friday the experiments with percussion shells were resumed. The firing is described as the best ever witnessed in the marshes, as out of twenty-six shells fired, twenty-one entered the bulk-head, within a distance of less than twelve feet of each other; the other five burst at the mouth of the gun, and, consequently, could not reach the bulk-head so as to show how correctly the aim might have been taken. On examining the bulk-head, at the conclusion of the experiments, it presented an extraordinary spectacle—solid wood of fifteen inches square, and about fourteen feet in length, crossed by other pieces, all of the hardest timber, being rent into fragments not larger than a walking-cane.—Government have resolved to employ convicts in repairing the fortifications of Gibraltar, and directions have been received from the Home-office to embark a considerable number of convicts immediately for that garrison.

Robberies.—On Wednesday night, a German diamond-merchant, named Woolff, was robbed in Covent-Garden Theatre of a case of diamonds worth nine thousand pounds. It appears that Mr. Woolff, who is staying at a tavern in Bishopsgate, had received a supply of cut diamonds from Brazil, to dispose of in the way of business. Whilst sitting in the coffee-room of the tavern, he showed the diamonds to a friend, and observed two persons, who had the appearance of foreigners, and wore moustaches, watching his movements. He incautiously mentioned in the coffee-room his intention of going to the theatre in the evening. He went to Covent-Garden accordingly, and soon found the two foreigners in the same box with him. His suspicions, however, were not excited; but on leaving the theatre he missed from his pocket the box which contained the diamonds. A reward of 400*l.* has been offered for the recovery of the jewels, and a further sum of 150*l.* for the apprehension of the robbers. The Detective Force are already on the track of the foreigners, and it is expected that they will soon be in custody.

Mortality of the Metropolis.—The number of deaths registered in the week ending Saturday, Sept. 24, was 776: Males, 404; Females, 362. Weekly average, 1838-9-40-1—Males, 467; Females, 445. The distribution of this mortality over the different districts was as follows:—Western districts, 118; Northern, 139; Central, 158; Eastern, 174; Southern, 177.

Provincial News.

Arundel.—The meeting of the Arundel and Bamber Agricultural Society for the encouragement of meritorious labourers, took place last week. In the evening after the show, a dinner took place at which the Duke of Norfolk presided. After the usual toasts, his Grace took occasion to make some remarks on the present condition of the agricultural population. "They were all aware," he said, "of the shortness of the straw, and how little the labouring man had been able to make either of the corn or hay harvest, and, taking these things into consideration, it was necessary, both for farmers and their landlords, to inquire how the labourers were to pass the winter. He was seriously afraid that there would be a vast number of workmen out of employ, and they all knew that, if this were the case, it was likely that badly-disposed persons would get amongst them and put evil thoughts into their heads. He liked to take time by the forelock, and he trusted that all present would endeavour to devise means to find work which would enable the labourers to earn money enough to support their families through the winter. It was a serious question for them all, and he recommended the calling of parochial meetings to consider the subject. He should be delighted to attend them, and to do all in his power to prevent the labourer from being distressed, and he hoped that the farmers would use their best efforts for the same purpose."

Ashbourne.—On Tuesday, a public dinner was given in this town to Mr. Colville, M.P.; Mr. Mundy, M.P., and Mr. Harrison, of Snelston-hall, by the guardians of the Alstonfield and Brassington Gilbert Incorporations, "in order," as the public advertisement stated, "to afford an opportunity for an appropriate demonstration of gratitude to the above-mentioned gentlemen for their invaluable services in maintaining the Gilbert Unions." As many as 1080 gentlemen sat down to dinner; Sir Henry Fitzherbert in the chair. After the usual toasts, the meeting was addressed at great length by Mr. Ferrand, Mr. Walter, and other gentlemen in behalf of the Gilbert Unions, and urging a modification of the present Poor Law. Upwards of 700 ladies were assembled in the galleries.

Birmingham.—On Tuesday the magistrates were engaged for a considerable time in the investigation of a singular charge. It appears that for some days past a foreigner, who represents himself as the Archbishop of Tripoli, has been on a visit to this town. In the day-time he has partaken of the hospitalities of the Rev. J. Allport, and at night has slept at the Railway Hotel, or at the Liverpool station. As he came highly recommended, and brought with him alleged credentials of his authenticity from the highest authorities in the Church, Mr. Allport took great interest in him, and was instrumental in obtaining several donations towards the purposes detailed in his circular, announcing that he had come to England to raise a fund for restoring five towns of his diocese on Mount Lebanon, which were destroyed by fire in 1840, and for extending education on scriptural principles throughout that interesting district. The circular also stated that he had brought with him a young Syrian, in order to be educated in England for the purpose of carrying these objects into execution. At a recent visit to Leamington the Archbishop had obtained a large collection, chiefly in consequence of a report that he intended to become naturalised as a British subject, and ultimately effect a union between the Eastern Church and the Church of England. On Monday, while he was endeavouring to excite the feelings of the inhabitants of Dudley and Wolverhampton, information was brought to Mr. Allport by several parties, that he was harbouring and recommending an impostor. Upon hearing this, the rev. gentleman instituted further inquiries, and found the circumstances so suspicious, that he secured the services of the Police Inspector. On going to the Railway Hotel, they ascertained that the Archbishop had never had any luggage there, and that he had ceased to occupy his room; and on following him to the Liverpool station, they met with the young Syrian who attends him on his travels, and is referred to in the circular. The account which the Archbishop gave of himself was not satisfactory to Mr. Allport or the Inspector, and accordingly both the prelate and his disciple were taken into custody. On Monday they were brought up for private examination before the magistrates of this town. Evidence was adduced to show that the prisoners had given most contradictory accounts of themselves; but, on examining the passports, credentials, and other documents in their possession, the magistrates were by no means satisfied that the Archbishop was an impostor, and accordingly dismissed both him and his associate.

Blackburn.—The Blackburn *Standard* mentions a report, that at the time the turn-out took place in Lancashire, Mr. Fielden, M.P., had upwards of one million pieces of manufactured goods on hand, so that the strike has proved advantageous for him, as he is now in the market with a good sale, at an advance of from ninepence to one shilling per piece, whereby it is calculated that he will net a clear profit of from seventy to eighty thousand pounds. Several other houses, it is said, will make a handsome sum by the occurrence.

Bolton.—At an inquest held a few days since at Little Bolton on the body of a lad of 15 years, the son of a respectable man named Eccles, some circumstances were disclosed which led the coroner to believe that the stepmother had poisoned the deceased, and had previously murdered nine persons by the same means. It appears that her first husband died suddenly under suspicious circumstances, and that eight of her children have also died without any apparent illness. From facts brought to light at the inquest, it is now supposed that they fell victims to her extraordinary predilection for poisoning. In this instance, the presence of arsenic was fully proved, and the inquiry was adjourned for further evidence.—The local papers state that the largest chimney in England has just been completed at the chemical works of Mr. Blinkborn, at Little Bolton, from the designs of Mr. Ashton of Bleakley. The dimensions are 122½ yards high, 127 feet 6 inches base, 108 feet inside, 24 feet on the top; it has consumed 800,000 bricks, and 120 tons of stone.

Bristol.—An extraordinary affair has recently occupied the attention of the citizens of Bristol, and has been more than once before the notice of the magistrates of the metropolis. The details afford a singular mixture of credulity and fraud, and have been reported at great length in the daily papers. It appears that a Mr. John Woolley, a timber-merchant of Bristol, a widower, had been informed by his sister-in-law, Miss Ann Briers, who had resided in his house for several years, that a lady of a respectable family in the town with a fortune of 47,000*l.* had taken a great fancy to him from seeing him pass her windows, and that, as her hopes of happiness were fixed upon him, she had a strong desire to become acquainted with a gentleman who had produced such an impression. Mr. Woolley, who had never seen the lady, replied that he had "no objection to acquiesce in her wishes." A correspondence ensued, which was carried on by means of the sister-in-law, and shortly afterwards a proposition for an interview was made in the lady's name. Mr. Woolley consented, but was then informed that his fair admirer had expressed a determination not to see him until the day fixed for their marriage. It was then arranged that they should elope, Mr. Woolley having declared that he had "no objection" to do so, and "although he had not seen her, yet if she was willing to accompany him he would take her away." In the midst of these occurrences the affair was talked of in the city, and the brothers of the lady whose name was used took measures for apprising the gentleman that it was a hoax, and that she had no knowledge whatever of the transaction. The sister-in-law, Miss Briers, was not to be foiled, and after persuading Mr. Woolley to decline their visit, an elopement was effected with a young woman, whom the sister-in-law induced to personate the lady. After a series of absurd adventures the parties arrived in London, when the lady informed the bridegroom-elect that she had a fortune of 47,000*l.*, 27,000*l.* of which she would make over to him, the remainder to be settled on herself for life. Mr. Woolley, with his usual facility, "acquiesced in this latter arrangement, and having procured a licence at Doctors' Commons, they were accordingly married at St. John's Church, in the Borough, on the morning of the 12th September," the bride being so mastered by her nervous feelings, that it became necessary for the sister-in-law, Miss Briers, to guide her hand while signing the register. All this took place without inquiry or suspicion on the part of Mr. Woolley, who did not even begin to perceive his position until the end of the week, when both sister-in-law and bride disappeared, with two boxes, filled with clothes and other articles of value purchased for the marriage. The loss of this property brought the merchant to his senses, and he accordingly took measures for recovering it. He met his wife and sister-in-law in the city in the course of the week, and gave them into custody. He had in the mean time discovered that the woman he had married knew nothing of the lady whose name she had assumed,—that she could not write, and consequently that the letters which had passed were written by the sister-in-law,—that she was of low origin, and had been a servant in his neighbourhood at Bristol. After the exposure of these facts, the females were remanded by the magistrate on a charge of conspiracy, and several cases in which they have obtained articles from tradesmen in Bristol under false pretences have since been published. The merchant intends to carry the case into a higher court, to prefer a charge of forgery at common law against the wife, and that of felony against the other prisoner.

Derby.—On Friday, the 30th ult., a burglary, attended with murder, was perpetrated at the house of the Miss Goddards, of Stanley, about six miles from this city. The house is a large one, standing alone, and not within one hundred yards of any other residence. It is surrounded by orchards and fields, and the direct approach to it is by means of a private road. The two Miss Goddards were considerably advanced in years, the deceased being in her 70th year, and the survivor but few years younger. They have resided alone in this house, without servant or assistant, for more than 40 years; and although their habits were somewhat eccentric, they had the reputation of being charitable and humane. Their father was the vicar of Tideswell, in this county, and they possessed a comfortable independence. In April last, a burglary was committed on the same premises. A few weeks ago a second robbery was committed. After this, arrangements were made by friends for two persons to sleep in the house; but the ladies would not hear of it, and they, therefore, continued to live in the same way as usual. On Friday last, the house was again entered, and both the ladies were beaten so severely about the head and face, that the eldest, Miss Martha Goddard, has since died. Government immediately offered a reward of 100*l.* for the apprehension of the murderers; the friends of the family also offered an additional sum of the same amount. Within the last few days, two men have been apprehended at Belper on suspicion, and the evidence is said to be so clear as to leave no doubt that they are the parties concerned.

Devizes.—We find in the Devizes *Gazette* the following account of a novel use for obliterated postage stamps:—"A gentleman has promised his niece, who has been living with him for some years, and from whom he is unwilling to part, that he will give her 3,000*l.* on her marriage as soon as she can procure the amount in postage stamps which have been used on letters. The promise was evidently made under the supposition that the collecting the requisite number (720,000) was impracticable; but we think, with the assistance of the ladies, which we have no doubt will be freely given when they become acquainted with the case, that the object may be accomplished. We understand that collections, sent directed P. S., Post-office, Milford, near Lymington, will be duly forwarded." A similar promise was lately made for a church in the West of England, and was fulfilled in the course of a few weeks. The local papers justly remark, that the donors in both instances have done their best to take off the grace of their donations by exacting such a condition.

Liverpool.—The examination of Patrick Doran, on the charge of having caused the late fire in this city, was brought to a close on Friday. The evidence for the prosecution had established that the fire was first seen in the prisoner's premises, and that the prisoner was found inside his door comparatively unconcerned, while the rest of the house was in flames. The defence alleged that the prisoner was not in the house but in the theatre at the time, and that there was another man there who had been mistaken for him. The man was brought into the witness box, but entirely broke down; and his evidence was rejected by the Magistrate as wilful perjury. The *alibi* also broke down, all the witnesses giving contradictory statements, both of the appearance of the theatre and the movements of the prisoner. On Friday, after the defence had closed, Mr. Rushton summed up, and concluded a long, minute, and clear recapitulation of the evidence for and against the prisoner, by saying that there was sufficient upon which to commit the prisoner; but, on account of the testimony about his having been at the theatre, he would admit him to bail, himself in 200*l.*, and three sureties in 100*l.* each. The respective depositions of each witness were then read, and the parties bound over to prosecute. The local papers of Monday give some account of the present appearance of the ruins, and state that any description would fail in giving an idea of the magnitude of the area and diversity of the ruins. 200 men are employed in clearing Formby-street, piling the bricks, excavating, and saving the fragments of scorched cotton and some wrecks of the property. All appearance of active fire has subsided, but the masses of ruin and foundations are still smoking, and probably will do so for some days to come. A current of water is continually pouring into the lower floors and cellars, from the sewers communicating with the canal, and all the disposable fire-engines are still playing on the parts where indications of fire yet appear. A great quantity of cotton is constantly loading from the ruins, but in a damaged condition. Some casks of turpentine have been got out, but the greater part is lost, and is believed to have principally melted and floated down the sewer into the Mersey, where portions of it are yet cast up on the Cheshire shore. A large proportion of the bar and rod iron belonging to the British Iron Company has been recovered, and though damaged, will be far short of a total loss; but still the salvage will altogether bear an extremely small proportion to the destruction. One or two bodies have been found during these operations, and it is now believed that the total loss of life was not more than six.

Manchester.—On Saturday the Rev. W. Hill, the editor of the *Northern Star* (Mr. Feargus O'Connor's paper); Messrs. James Arthur, bookseller of Carlisle; G. Julian Harney, bookseller of Sheffield; R. Otley of Sheffield, and John Campbell, of London, five well-known Chartist lecturers, were placed before the magistrates of this town, on a charge of sedition and conspiracy, and remanded for further inquiry. From these persons all the seditious placards which were issued during the riots are said to have emanated, but hitherto they had contrived to elude the vigilance of the authorities. Several other well-known Chartist leaders were also in custody, among whom may be mentioned the Rev. James Scholefield and his son, Mr. T. B. Smith of Leeds, and Mr. Samuel Parkes. On Tuesday, they were all brought up for examination on the charge of general conspiracy and intimidation. Mr. Cobbett appeared on behalf of the prisoners. Mr. Brandt opened the case by stating at considerable length the nature of the present proceedings, detailing, as he went on, the nature of the insurrectionary movements which had led to the recent disturbances, and connecting, by ingenuity and argument, the prisoners as either taking an active part in the illegal proceedings which had led to the apprehension of the prisoners. The learned gentleman quoted a number of the Chartist placards, documents, and publications, and called witnesses in support of his statements. The inquiry was continued at some length, and after a long investigation the magistrates committed the prisoners for trial, but accepted bail for their appearance. Mr. Feargus O'Connor was arrested in London last week on a similar charge; in consequence of which a large meeting of the Chartist delegates has been held in this town to take into consideration the propriety of calling the General Council of the Metropolitan Chartist localities together, in connexion with the arrest of Mr. O'Connor and the other Chartists. An address to the country was adopted, and a resolution to call the metropolitan council together, and to request the Chartist associations within fifty miles of London to send delegates to the metropolis forthwith, was passed. After the disposal of the other business of the day, the meeting separated in an orderly manner. The local papers state that Dr. M'Douall has deserted his former associates by emigrating to America, in order to escape the consequences of his recent proceedings as one of the leaders of the riots.

Newcastle.—The musical festival, which has been some time in preparation here, took place last week and lasted for two days, the performances being alternately at St. Nicholas' Church in the morning, and at the Theatre in the evening. The Church had undergone extensive alterations in the interior in order to adapt it for the purpose. The orchestra was considerably enlarged, so as to accommodate the performers, and every obstruction was removed from the aisles, so as to admit of the uninterrupted ingress and egress of the auditory, whilst for the patrons of the festival a commodious gallery was erected over the altar table, and covered with crimson cloth, which the local papers describe as giving it "a very elegant and comfortable appearance." The first morning's performance included Handel's Dettingen *Te Deum*, the *Sampson*, selections from *Joshua* and Beethoven's *Mount of Olives*, On the second morning the pieces were Haydn's *Creation*, selections from Handel's *Israel in Egypt*, &c. On the third morning the great attraction was the *Messiah*. The performances at the Theatre were chiefly overtures from favourite operas. In reference to this festival the *Times* has severely commented on the desecration of the Church, and has declared its intention of opposing the future celebration of musical festivals in places dedicated to divine worship, as an act objectionable in itself and in direct violation of the rights of the parishioners.

Portsmouth.—The Royal George yacht, Captain Lord Adolphus Fitzclarence, has returned to this port from Woolwich. It is stated that she is to be examined, and if found practicable, to be fitted with engines and converted into a steam yacht, for Her Majesty's use in any future excursions. The promotions consequent on Her Majesty's visit to Scotland, have not been very extensive at present, and have been confined to the officers of the yacht.—The Earl of Errol appeared on Tuesday before the mayor and magistrates, to answer a summons preferred against his Lordship for striking a police-constable, stationed at the King's-rooms, on the night of the ball given by the officers of the 16th Regiment, on the occasion of the regiment being presented with new colours. The mayor was of opinion that the police-constable was struck while in the execution of his duty, and considered the case should be decided by a jury; his Lordship was, therefore, bound over to appear at the next sessions.

Southampton.—The alleged Chartist conspiracy, to which we alluded in our last, has assumed a new aspect within the last few days, in consequence of the arrest of the suspected party. Our readers will recollect that Government had offered a reward for the apprehension of the offender. The story told by Mr. Pierce, a grocer of this town, who was formerly a leader of the Chartists, gave an account of an alleged Chartist plot to assassinate the Queen, and a subsequent attempt on his life, because he would not join it. He produced a hat through which a bullet had evidently passed, and described the attempted assassination as taking place on the 6th ult., at Houndwell, near this town. On Thursday of last week, John Gifford, a man answering the description given by Mr. Pierce, and employed occasionally on the Southampton river, was brought to the Town-hall, before the Mayor and other magistrates. A man named Grist, the witness who charged the prisoner, stated that he was crossing the High Field, near Houndwell, on the night of the 6th ult., when he observed Pierce, to whom he bad "Good night." Shortly afterwards he saw a man go up to him, present a pistol, and fire at him. He then jumped across the ditch, and ran some distance. The witness pursued the prisoner to his house. He further stated that he mentioned this fact to his employer, who, two or three days after, on reading the bill offering the reward, advised him to give information to Mr. Pierce, which he did, and this led to the apprehension of Gifford. This man, who has been the means of apprehending the prisoner, admitted on his cross-examination, that his brother was prosecuted to conviction, by the prisoner, *for stealing duplicates from his box, and which were found in a room in which the witness and his brother slept.* The brother is now undergoing his sentence in the town gaol. The magistrates remanded the prisoner for a week, and on Thursday it was so clearly proved that he was at work when the alleged firing took place, that they acquitted him of the charge.

Stockport.—The investigations of Mr. Gregory, which commenced in this town on Friday, relative to the origin and progress of the late riots, have led to the apprehension of several parties who had not previously been in custody. On perusing the depositions, and further examining the different witnesses, disclosures were made which induced the high constable to take out warrants against several parties concerned in destroying property, intimidating the operatives against the tenour of the Queen's proclamation, and attending unlawful meetings. Several persons have been examined on these charges, and committed to take their trial at the commission now sitting. The *Stockport Chronicle* gives some curious statistical facts respecting the recent strike. It states that it is not enabled to give exactly the precise number of different descriptions of hands in the borough who for the space of five weeks performed no labour, and received no wages; but it can state confidently, that those employed in the cotton manufactories alone, all of whom were out, receive at present about 9000*l.* per week; so that the direct loss, in this respect, is about 45,000*l.* But in a population of about 50,000 souls, something like a thousand families constitute the distributive class—as corn-dealers, bakers, grocers, drapers, butchers, publicans, milkmen, &c.; and about the same number compose the various trades which are carried on in all the town communities, and the loss to these, from the stoppage of the whole staple trade of the town, cannot have been less than 3000*l.* per week, or in the whole, 15,000*l.* It adds that if the manufacturers are making only very trifling profits, considering their large capitals, they must have lost, in the aggregate, not less than 30,000*l.* more. Thus the whole loss of the borough may be said to be somewhere about 75,000*l.*, an amount sufficient to have purchased 36,000 sacks of flour, which would have supplied the town for at least six months, to have given a day-school education to all the youth of the town for ten years, or have bought and laid out in its vicinity a park of several hundred acres, for the use of the inhabitants for ever.

Windsor and Eton.—On Monday, Prince Albert, attended by several gentlemen of his suite, shot over the preserves in the neighbourhood of Cumberland-lodge and Virginia-water. The Prince, who was not in the field above three hours, brought down no less than 24 brace of pheasants, 4 brace of partridges, with a leash of hares and a couple of rabbits. Throughout the morning only three of his Royal Highness's shots failed. On Tuesday the Prince's harriers were hunted for the first time this season. They soon found, and a fine hare was taken near Datchet, after a good run of upwards of an hour and a half.—The examination of candidates at Eton for his Royal Highness's prize for proficiency in modern languages took place last week. The prize of 50*l.* was this year divided into two of 20*l.* each, and two of 5*l.*, all given in books bearing the Royal Arms and those of the College. In French and German the first prize was won by Mr. Lambton; the second by Mr. Dodson. In French and Italian, the first prize was won by Mr. Dodson; the second by Mr. Bastard, who has obtained the first mathematical prize twice, the first French prize twice, and has the honourable figure of ten attached to his name on the last Eton list.—The funeral of the late Marquis Wellesley will take place in the College Chapel this day. It is said that his Lordship expressed an anxious desire, upwards of ten years ago, that his remains should be deposited as close as possible to those of his friend Dr. Goodall, the late Provost of Eton, who held that appointment from 1809 till the period of his death in 1840. The high opinion entertained by Dr. Goodall of his Lordship's classical attainments is proved by the following extract from Dr. Goodall's evidence before a Committee of the House of Commons on Education:—"I should be sorry," he said, "to detract from the merit of such a man as Professor Porson, whom I loved, esteemed, and admired; but I would name the Marquis Wellesley as infinitely superior to him in composition. The Marquis, as a genuine Greek classic scholar, exhibits the exquisite style and manner of Xenophon."

Railways.—The following are the returns of the principal railways for the past week, viz.:—Birmingham, 17,262*l.*; Great Western, 14,632*l.*; Brighton, 4,523*l.*; Hull and Selby, 1,062*l.*; Eastern Counties, 1,077*l.*; Birmingham and Derby, 2,214*l.*; South-Western, 6,657*l.*; Manchester and Leeds, 5,018*l.*; Edinburgh and Glasgow, 1,998*l.*; North Midland, 4,822*l.*; Greenwich, 735*l.*; Great North of England, 1,323*l.*; Midland Counties, 2,841*l.*; and South-Eastern, 1,559*l.*—The West London Railway Company have not yet concluded the arrangement to carry on the works, the Manchester shareholders requiring time to consider the proposition made relative to the issue of new shares.—The meeting of the Eastern Counties Company has been postponed to the 28th inst., in consequence of the recent wet weather having interrupted the completion of the line to Colchester, it being thought desirable to have the line opened to that point before the shareholders enter into a discussion of the prospects of the company.—The meeting at Plymouth, to consider the three plans submitted for the construction of the railway from Exeter to that town, have come to a resolution to adopt Mr. Rendel's line of railway, by Ashburton, Totnes, Newton, and Exeter, on the understanding that sufficient encouragement be offered by the landowners and inhabitants of the district, without which all idea of a South line must be abandoned as impracticable, in consequence of the large outlay that would be required. It is deemed an essential object before any further steps are taken, to ascertain how far the landed proprietors on the proposed route are disposed to support the undertaking. The alternative, in the event of disappointment from the South, is to adopt the line over Dartmoor, through Prince Town and Chagford. This line is shorter by five miles, and consequently could be effected in less time, and at less expense; and though offering a lower return, it would in all other respects be equally advantageous to the commercial and naval interests of Plymouth.—At the meeting of the Gloucester Company, held last week at Bristol, the report stated that the works between Westerleigh and Stonehouse were in such a state of forwardness, as to induce a belief that they would be completed within the time prescribed. The receipts for the half-year were 166,738*l.* 7*s.* 10*d.*; payments, 147,659*l.* 18*s.* 6*d.* The report was considered satisfactory, and the resolutions arising out of it were passed unanimously, and without discussion.—On Thursday of last week a special train, which was a curiosity from its length and freight of passengers, arrived at the Paddington station of the Great Western Railway, propelled by two engines, and containing between 700 and 800 inhabitants of Bristol and its vicinity, who had availed themselves of the opportunity afforded by the directors of making a trip at half the usual fares to London, to pass Michaelmas-day among their friends, and see the sights of the metropolis. The train left Bristol at 7 A.M., and arrived at the Paddington terminus about 12, having stopped to take up an additional number of passengers at the Bath, Chippenham, and Swindon stations. The party left town on their return to Bristol at 5 in the evening.—A special meeting of the Northern and Eastern Company took place on Wednesday, to consider a scheme for the disposal of 3,136 forfeited shares, to negotiate the leasing of the line, and to authorise the directors to borrow 155,000*l.* Mr. W. Marshall, M.P., in the chair. The prominent feature of discussion was the alleged incapacity of the present directors to carry on the undertaking at a profit; and this they acquiesced in themselves, by admitting their readiness, at a period not far distant, to resign their trust into the hands of the shareholders, to be filled up as they should think best. Resolutions were then passed for the disposal of the 3,136 forfeited shares, to be sold *pro rata* among the proprietors, and also for authorising the directors to borrow 155,000*l.* The chairman then stated, in reference to the extension of the line to Hertford and Ware, that the subject was at present in abeyance, owing to the company not having sufficient funds. Mr. Ward, M.P., congratulated the shareholders on their having retained possession of the line, the resources of which, he believed, were yet only partially developed.—Arrangements have just been concluded between the Post-office authorities and the directors of the Brighton Railway for the transmission of both the day and night mails. Hitherto the day mail only has been carried by railway, the night mail travelling by the old road, owing to several of the towns within its delivery not being adjacent to the railway. Mail-carts from the various stations will now convey the letters to these towns.

IRELAND.

Dublin.—The Lord Lieutenant arrived here on Monday, after an absence of some weeks in Germany, which is said to have proved very beneficial to his health.—The new Law appointments consequent on the death of Sir M. O'Loghlen are the principal topics of discussion. Mr. Blackburne is mentioned as the new Master of the Rolls; Mr. T. B. Smith, so recently appointed Solicitor-General, will succeed Mr. Blackburne as Attorney-General, and the office of Solicitor-General, thus vacant by his promotion, is to be conferred either on Mr. Brewster or Serjeant Warren. Mr. Litton is spoken of as the new Master in Chancery.—The Corporation on Saturday had a discussion on the subject of the compensation to the late Treasurer, Sir J. K. James, under the Municipal Reform Act. A resolution was brought forward by Mr. O'Connell to reject his claim with a view of bringing the question before the Lords of the Treasury. The principal grounds set forth in the resolution were the refusal of the ex-treasurer to answer certain questions put to him. Alderman Butt spoke in favour of the claim, and contended that Sir J. K. James was an injured and persecuted man. Mr. O'Connell's resolution was carried by a majority of 21 to 8.—The Repeal Meeting took place as usual on Monday, but the only novelty was the reading of the reports sent in by Mr. John O'Connell, Mr. Ray, &c., respecting their Repeal mission.—The contractors for the execution of the Dublin and Drogheda railway from Balbriggan to Drogheda commenced operations last week in a field about half-a-mile from Drogheda.—An application was made in the Prerogative Court a few days since, on behalf of the sisters of the late Mr. Augustine Byrne to discharge the application of Mrs. Ellen Byrne, who has lately acquired such notoriety in Dublin, for letters of administration to the property of her late husband. These ladies had entered a *caveat* against the application of Mrs. Byrne, and, in compliance with the order of this court, had filed allegations which would show that she was incompetent to fulfil the duty that would be imposed upon her, and not entitled to the appointment of administratrix. They alleged that, according to the conditions of her marriage-settlement, she made her election by taking 6,000*l.*, which barred her of dower or any right to the other portion of his personal property. Also, that she was personally disqualified from her habits of intemperance, and having concealed the death of her husband for a considerable period after it occurred. As a further proof of her incompetence, the sisters alleged that she had been removed by the Lord Chancellor from the guardianship of her own children upon their (her own children's) application. The proctor for Mrs. Byrne, prayed time to exhibit a counter-allegation, which, he had no doubt, would set the matter in a very different light. He had only that moment received the copy of the defendant's allegation, and would require some days to prepare the answer of his client. Dr. Radcliffe said he would allow a fair time to Mrs. Byrne to prepare her counter allegations, and he would expect her to answer personally some of the allegations exhibited on behalf of the next of kin. On Thursday the case was again brought forward, and decided against Mrs. Byrne.

SCOTLAND.

Edinburgh.—Some of the Mid-Lothian rioters have been captured and brought to this city. Last week, while the police constables were on patrol in the neighbourhood of Old Craighall, they detected a collier stealing potatoes, whom they immediately apprehended. This circumstance having become known, many colliers turned out and rescued the prisoner, at the same time assaulting the constables, two of whom were wounded on the head. Information having been sent to the head-quarters in this city, warrants were issued by the Sheriff against four individuals accused of having been concerned in the rescue. To prevent any further resistance to the law, the Duke of Buccleuch, Lord-Lieutenant of the County, accompanied the Sheriff, who proceeded with a body of the county police to Craighall. The parties were found after some difficulty, and were brought to this city for trial.—It is stated that the Duchess of Sutherland, in order to co-operate with the noble duke in his efforts to extend education on his grace's immense estates in Scotland, has given direction that the various schoolmasters should be sent to this city at her expense, for the purpose of being instructed in the system of education adopted at the normal schools. It is also said that the Marquess of Bute, who was patron of the Bute Savings Bank, has generously undertaken to make good the deficiency occasioned by the failure of the Renfrewshire Bank, where its funds to the amount of 1,400*l.* were deposited.

Ayr.—The local papers inform us that some symptoms of a better understanding between the masters and men begin to manifest themselves at Kilmarnock. At Gatehead and Fergushill works, the men, with few exceptions, have renewed their engagements for a twelvemonth, as has been the custom for some years back. Both pits are going on as usual. In Irvine hopes are entertained of an amicable settlement being effected in a short time. In the neighbourhood of this city matters continue as they were, without any immediate prospect of an adjustment.

Perth.—It was recently stated in the Perth papers, that the managers of one of the London Opera-houses had gone North to engage 32 pipers and dancers for a theatrical speculation in London, where they are to perform Scotch music and dances in the costume of the Highlands, and afterwards proceed to Paris during the Carnival, and from thence to Germany. It is now announced that they have been successful, and that the pipers and dancers who performed before Her Majesty have been preferred, which is expected to prove a recommendation to the individuals, and give an attraction to the spectacle which could not otherwise be obtained. Much attention, it is said, has been paid to ensure the comfort of the persons engaged; their fathers, mothers, or some near relatives, having been invited to accompany them.

Stirling.—A display of the ancient military exercise of tilting took place last week at Aithrey Park, the seat of Lord Abercromby, between this city and Allen Bridge. The Hon. Miss Abercromby, daughter of his lordship, acted as Lady Paramount, or Queen of Beauty, and awarded the prizes to the successful competitors. The first prize was obtained by Mr. Campbell, of the 42d regiment. The weather was favourable, and a military band amused the company during the intervals of the tilting.

THEATRICALS.

DRURY LANE.—This theatre opened for the season on Saturday, under the most favourable circumstances. The house was completely filled, and so far as the enthusiasm of the audience was concerned, Mr. Macready must have been convinced that he has the sympathies of the public in this second experiment for the revival of the national drama. The production of plays and music, invested with all the charms of Mr. Stanfield's scenery, and intrusted to a most complete company, strengthened by the names of Mr. and Mrs. Mathews, and Mrs. Nisbett, form the staple of attraction; and from the cordiality of Mr. Macready's reception at the outset, he has not miscalculated the public taste. Immediately after "God save the Queen," executed by the whole vocal strength of the company, a loud shout was raised for Mr. Macready, who came forward in the dress of *Jaques*, to receive the good wishes of his audience. The play of "As You Like It" was chosen for the opening performance, and was presented with all the skill and appliances which a full appreciation of the play might have been expected to suggest. The grouping and business of the scenery had all that excellence which is peculiar to Mr. Macready's management. During the wrestling of *Charles* and *Orlando*, the lively interest enacted by the stage audience, who were collected round the ropes and staves of a regular "ring," spread contagiously among the real audience, and united them in a general expression of exultation at the overthrow of "the bony prizer of the duke." The forest scenes were pictures of reality, varying with the different requirements of the action. Mr. Macready's *Jaques* is too well known to require description. His "Seven Ages of Man" was delivered without any of those exaggerations of effect by which this celebrated description had been given by former actors, who courted applause rather by fanciful imitations, than by the simple pathos and nature of the passage. The personation, on the whole, was very happy, in spite of that peculiar delivery which is the prevailing blemish of his acting. It had evidently been the subject of much study, and received the success it merited as a highly-finished and characteristic performance of a very difficult part. Mrs. Nisbett's *Rosalind* did not altogether realise the requisites of the character; though perhaps too joyous for that imaginative tenderness and sensibility which constitute the peculiar feature of the Duke's daughter, it was received by the audience with great applause, and was evidently regarded as one of the most successful efforts of the evening. Mr. Keeley appeared as *Touchstone*, and Mrs. Keeley as *Audrey*, and hardly seemed at home in their respective parts. Mr. Phelps's *Adam* was much applauded, and Mrs. Stirling's *Celia* was well adapted to the quiet thought and strong affections of the character. At the close of the piece Mr. Macready and Mrs. Nisbett were called for, and were received by a tumult of approbation. Among the new pieces mentioned as about to be brought forward are "King John" from the text of Shakspeare, and Dryden's "King Arthur" in opera. From so brilliant a commencement, there is little doubt of a successful season.—On Wednesday, after the tragedy of *Marino Faliero*, a new vaudeville was produced, under the title of *The Follies of a Night*. It is a sprightly little piece of French origin, full of adventure and intrigue—the scene is Paris, and the date of the gallant days of Louis XIV. It was completely successful, and was well supported by Mr. and Mrs. C. Mathews, who made their first appearance at this theatre. They were received with a truly hearty welcome, and acted and sang with their usual grace and sprightliness. The other performers acquitted themselves well, and the piece was announced for repetition amidst great applause.

COVENT GARDEN.—On Saturday, Rossini's opera of "Semiramide" was produced at this theatre in an English form. In addition to the attractions of this brilliant composition, Miss Adelaide Kemble assumed a new character, and Mrs. Alfred Shaw, whose dramatic success in Italy, and previous triumphs at various concerts, had already raised her to a high rank in the estimation of the musical world, made her first appearance before a British audience. Miss Kemble appeared as *Semiramide*, a character already associated with recollections of Pasta and Grisi; and Mrs. Alfred Shaw took the part of *Arsace*, of which Malibran's representation is not likely to be effaced from the memory of the public. Miss Kemble's personation of the heroine was dignified and impressive; though the part does not admit of such powerful appeals to the audience as her *Norma*, it gave frequent opportunities for the expression of commanding energy and of the more tender passions of the character. The part, at times, seemed to make too great a demand on her physical strength, but her efforts were received by the audience with great applause, and she was called for at the close to receive a renewal of their approbation. The great event of the evening was the appearance of Mrs. Alfred Shaw. The audience seemed to feel how great an acquisition to the stage is a contralto voice, cultivated to the highest degree of perfection; and her welcome was therefore proportionately encouraging. Nothing could surpass the clear and simple manner in which she gave her first recitative; as she proceeded, every note was uttered with a precision and delicacy of finish which charmed the audience, and carried them along with a success rarely experienced on a first appearance. Her voice is completely at her command, full, mellow, and clear, realising all the beauties of her part, and reaching its highest notes without an effort. The audience were justly proud of the accession of so accomplished a vocalist to the English stage; and their welcome was full of such cordial enthusiasm as to leave the most happy anticipations for the future.

Miscellaneous.

Colonial Bishoprics.—The following are the particulars of the recently-appointed Colonial Bishoprics:—The Bishop of Gibraltar will have the superintendence of the British possessions and dependencies in the Mediterranean. There are, at nearly every large city on the immense line of coast from Lisbon to Constantinople, either congregations, or a sufficient number of persons to form congregations, of English churchmen. There will be two cathedral churches—one at Gibraltar, and another at Valetta, in Malta. The diocese of the newly-formed Bishopric of Van Diemen's Land contains a territory about as large as ten of our English dioceses, with a population of 50,000. The number of the clergy is at present about thirty. The next Bishopric to be formed is that of New Brunswick, which at present forms part of the diocese of Nova Scotia. The intended diocese is nearly as large as Ireland, and contains a population of 156,000. There are about thirty clergymen. Another Bishopric to be founded is for the Cape of Good Hope, which contains an area of 130,000 square miles, that is, more than the whole of England, Ireland, and Scotland put together. The population amounts to 166,000, and are widely scattered. No Bishop of our Church has visited this colony during the last five years, and, consequently, the rites of confirmation and consecration have been altogether omitted for that period. There is a remarkable activity among the various Dissenting bodies at the Cape, and the affairs of the Church are said to require the care and attention of a Bishop. Another place for which a Bishop will be provided is Ceylon. It is in extent nearly the same as Van Diemen's Land, both islands being about 24,000 square miles. Its population, however, is much greater, namely, one million and a quarter—the greater part of them being heathens. The number of chaplains and missionaries together is 22. Ceylon is at present in the diocese of Madras, but it is evident that no efficient control can be established under such an arrangement. When competent provision shall have been made for the endowment of these Bishoprics, regard will be had to the claims of Sierra Leone, South Australia, Port Philip, Western Australia, Northern India, and Southern India.

African Chapels.—The "Sierra Leone Watchman" mentions as a fact which must be gratifying to every individual who rejoices at the downfall of slavery, that out of 26 Wesleyan chapels in Sierra Leone, the roof-timbers, the flooring, and other wood-work of 20, are composed nearly exclusively of slave-ships, which have been taken by Her Majesty's men-of-war on the coast, and condemned by the mixed commission court.

King Alpin of Scotland.—Last week a skeleton was found, in digging through the mound at Pitalpin, on which the ancient stone stands to commemorate the battle fought between the Picts and the Scots, in the year 834. This skeleton must be the remains of King Alpin, who was taken prisoner in the action, and beheaded by the Picts; for, though some histories state that his head and body were removed by the Scots to Icolmkill, and there buried, yet the fact of now finding the head severed from the body, which was in the centre of the mound, and distant some fields from the mass of the bones of those who fell in action, renders it certain that this must be the skeleton of some chieftain, and there is no record of any one of note having fallen on this occasion except King Alpin. It is singular that this skeleton of King Alpin, the last King of the undivided sept of the Scots, and from whom her Majesty Queen Victoria is lineally descended, was discovered the very day she crossed the Tay and entered the border of her ancestors' older dominions. These Royal remains have been carefully collected and placed in a shell, and are now deposited in the Watt Institution, where they may be seen by the public.—*Dundee paper.*

Mortality of Bachelors.—Dr. Caspar, of Berlin, states that the mortality of bachelors, from the ages of 30 to 45, is 27 per cent.; of married men, of the same ages, 18 per cent. For 41 bachelors who attain the age of 40, there are 78 married men. The difference is more striking as age advances. At the age of 60 there are but 22 bachelors alive for 48 married men; at 70 years, 11 bachelors for 27 married men; and at 80 years, for 3 bachelors there are 9 married men.

Galvanic Blasting.—The Glasgow papers state that Mr. Lyon of that city, the contractor for the new harbour at Dunbar, has lately introduced the galvanic battery to aid him in his extensive blasting operations. Several explosions of considerable magnitude have recently taken place. The largest contained 60lbs. of powder, distributed in five bores of great depth. The bores were placed so as mutually to assist each other, and the conducting wires so arranged that the whole five were fired simultaneously by one battery. It was surmised that by this method the effect would be much greater than exploding the shots singly, and the almost incredible quantity of rock thrown down showed the correctness of the anticipation. In another instance, in order to throw down a part of the celebrated Castle of Dunbar, three bores, fifteen feet in depth, were run obliquely into the rock below the foundation. They were exploded together, and lifted from its bed in one unbroken and compact mass a body of masonry weighing not less than 150 tons.

A Heathen Hospital.—The Rev. Mr. Allen, an American missionary, in giving details concerning the various public institutions in Bombay, thus notices what every one must regard as a most singular establishment:—"It has been said that heathenism never furnished an hospital. There is at least one exception to the truth of this remark. There is one here, supported at an expense of 16,000 dollars annually. It was founded by a donation of 140,000 dollars, by a native merchant of the Jain sect—the sect which appears to approach nearer than any other to the primitive Hindooism with which Pythagoras became acquainted at Babylon. Its doctrines strictly forbid the destruction of animal life in any case whatever. The management of this hospital is wholly in heathen hands, and heathen liberality furnishes all its resources. In it are gratuitously supported from 50 to 100 old horses, which would otherwise be killed as past service; about 175 cows and oxen; 200 dogs, for whose destruction the authorities of Bombay offer a bounty twice a year; and a large number of cats, monkeys, and other animals. Its charities are accessible to living beings of every species except the human race. Men, women, and children (wounded, sick, and destitute), are allowed to die unaided within sight of its walls. Such is the character of the only hospital, so far as is known, that heathenism ever built."

Law.

THE SPECIAL COMMISSION, STAFFORD.—The Commission commenced on Monday, when all the prisoners were conveyed to the Court House under an escort of the 3d Dragoon Guards. The Judges were attended by the Lord Lieutenant, the High Sheriff, and a great number of county magistrates. The Grand Jury was then sworn, Lord Ingestre being appointed foreman. After the usual proclamation, the Lord Chief Justice Tindal addressed the Grand Jury in the following remarkable speech, which embraces so comprehensive a view of the recent riots, and expounds with so clear a judgment the common law of England upon the whole question, that we have no doubt it will be read with interest by all classes. His Lordship said—Gentlemen of the Grand Jury, it is with unfeigned regret that those who have been appointed under her Majesty's special commission to inquire into and adjudicate upon the crimes committed within this county since the last assize, are called upon to meet you, the Grand Jury, upon this occasion. It is at all times a painful and distressing occupation for the minds of the Judges to pursue the investigation of charges of guilt, and to apportion the proper measure of punishment to be awarded to each individual offender. If this be the case in the comparatively few instances that occur in the ordinary administration of annual justice at assizes, much more is it on the present occasion, when the number of offenders is large, and the nature of the alleged offences so injurious to the welfare of the State; and when the offences have been committed, not by single individuals, or even small numbers of persons, but large masses of the community, impelled by one common motive, and labouring to effect one common object. Gentlemen, it is not our design, nor indeed have we sufficient evidence, to enter into the origin of those excesses and violations of the law that will be shortly brought under your consideration. It will be sufficient to give a general outline, drawn from the depositions made before the magistrates of the county, which form the only legitimate source of our information. About the middle of August the working-classes—those employed in mines, collieries and factories—became dissatisfied with the amount of wages paid them, which they deemed not to be equivalent for their labour. They then, in order to compel their masters to alter their regulations and grant greater wages, formed themselves into associations and refused to work for their employers. They not only continued to do so themselves, but they compelled, by threats, violence, and intimidation, other workmen, who were content with their work and wages, to discontinue such work and join the discontented. It further appears that while large bodies of the working classes were thus uniting together, and were in a state of idleness and poverty, others from distant parts of the country, strangers to and unconnected with them, came amongst them, and excited them to increased discontent with their wages and the institutions of the country, and persuaded them, by inflammatory harangues against the laws and religion of the country, to persevere in their refusal not to return to their employment, as the only sure and effectual means of obtaining a redress of their alleged wrongs, and securing their just rights, called the "People's Charter." It further appears that, some time afterwards, tumult and disorder ensued in some places, to the great alarm and terror of the peace of the community. In other places large bodies proceeded to acts of open violence and breaches of the law against her Majesty's subjects, robbing some and cutting others, with intent to inflict bodily injury; others committed theft and plunder by breaking into dwelling-houses by day and night, by the destruction of dwelling-houses by demolition and force, beginning with the dwellings of magistrates, public offices connected with police establishments, and carrying the same ruin to the dwellings of private individuals. It is impossible to say to what extent this destruction, and those mob riots, would have proceeded, if their progress had not been countervened by the zeal, activity, and earnestness of the magistrates of the county, supported by the united exertions of the military, who lent their ready aid when called upon in assisting to repress those disorders. By those combined exertions the work of further destruction was stopped, its ominous results arrested, and the law restored to its just supremacy. Gentlemen, it has been intimated that we conceive it to be no part of our province to discuss the subject of quarrel between the men and their employers, nor is it our duty to show by argument that the part taken by those who imagined themselves injured was least calculated to achieve their object, or that, perhaps, it was most likely to defeat what they sought to attain; nor are we called upon to suggest or discuss the remedies that may be provided by law to prevent similar results, should a similar dispute arise at a future day between men and masters—a discussion better suited for the Legislature than for us; the members of a tribunal which is to declare the law as it exists. Our direct and more useful course is to explain the law as it may apply to the unhappy prisoners upon whom you will be called to exercise your judgments, in coming to a just conclusion, as to whether sufficient evidence appears before you to send them for trial. It is to be observed, in the first place, that workmen, complaining of their wages as being inadequate, had assembled peaceably together to decide upon the rate of wages that should be required, and if they had entered into an agreement to fix a certain rate of wages, they would have done no more than the law allows them. A combination for that purpose, and to that extent, if such can be called a combination, is no more than is recognised as legal by the 6th of George IV. The same extent of power and no more is granted by the same statute to masters when they meet to regulate the wages to be paid the employed. In the dispute between masters and workmen as to the proper amount of wages, it was properly supposed by the Legislature that if the masters refused, on the one hand, to increase the wages, and the men on the other hand refused to work for less wages than they expected, sooner or later one party would give way whose pretensions were not founded on reason or justice—the masters, if they gave too little, the workmen if they demanded too much. But, unfortunately, the discontented did not rest satisfied with exercising their own power of withholding their own labour if discontented. They assumed the power of interfering with the right that others possessed—of exercising their own discretion on the same point. Accordingly you will have many cases where large bodies of discontented workmen, by personal violence and threats, and intimidation, compelled others, who were content with their callings, and willing to work for their rate of wages, to leave their work against their own will, and add to the number of the discontented. A more glaring act of despotic tyranny one man or set of men cannot perpetrate against others. If there is one right to which a man is entitled, it is the right of exercising his or their own skill, knowledge, and labour, with a will free and unshackled by any control or dictation. Yet, strange to say, this right, which the discontented claim for themselves to the fullest extent, they, by a stranger perversity and unmeaning selfishness, refuse to others. Such proceedings, so unreasonable as they are—so injurious as they are to the interests of society—so detrimental as they are to the rights of trade—so oppressive against the rights of the poor—and which are such gross flagitions violations of the law—must be put down by prompt measures, and severely punished as soon as the guilt of the parties practising it is established. But even if large bodies assemble together for any particular purpose, and conduct themselves with turbulence and violence, accompanied by threats calculated to excite terror, such an assembly is in itself a riot, even if its object be proper, just, and legitimate. If bills be brought before you charging individuals with riot, for the purpose of raising the rate of wages, then the evidence should show the conduct of the parties to be of the sort just adverted to. The appearance of riot then is complete in point of law. Gentlemen, there is one description of offence which will probably be submitted to you; namely, the exciting and encouraging large masses of the people, by means of seditious and inflammatory addresses. He who delivers addresses to the poor working classes, or to the unemployed, brooding over real or imaginary wrongs, will soon have a crowded auditory, and will not want hearers ready to perform any acts of mischief. You will, in such cases, consider the language used on that occasion. If it consists of broad assertions, unfounded in facts—if, in speaking on religious topics, you find him sprightly and facetious, on subjects which make good and wise men serious; and if, instead of arguments, you find him to deal in sneers and sarcasms; it will be for you to consider whether he be an honest but mistaken man, or whether he is wickedly intent to bring into contempt the Government, the laws, and religion of the country, and all that honest men hold in respect and veneration. Gentlemen, it has been already stated, that, amongst the multiplicity of charges that are made against the prisoners, some are for assaults, some for cutting and maiming with intent to do bodily harm, some for robbery with violence, some for theft, some for breaking into dwelling-houses by day and by night, beginning with the demolition of the houses of magistrates, clergymen, officers connected with police establishments, and dwellings of private individuals, and others are charged with destroying works by fire. It would be tedious and unnecessary for me to enlarge upon the law that regulates such offences, especially before gentlemen so well experienced in assize order of business. One observation applies to every species of offence that comes before you. If many are present when the breach of the law takes place, having one common view, acting in concert, though all do not take a share in that act which is the subject of the indictment, yet, by affording countenance and protection to the persons perpetrating this crime, they are all equally guilty in the eye of the law. But, gentlemen, there is one case in the calendar, I purposely avoided, that it might not interrupt the view which I took of the other cases; I mean the case of William Ellis, who is committed by the magistrates on the charge of high treason; and as we are not aware whether bills of indictment may not probably be preferred against that person, with others who appear upon the depositions in the same predicament, for the offence of high treason, it is necessary that the principle of the law, so far as it relates to this species of high treason upon which the charge, if preferred, will be probably founded, should be laid down for you with sufficient precision, to enable you to determine whether the transaction is so far established that the parties accused ought to be put on trial for that offence. The species of high treason upon which the charge rests, if made, must be either that of levying war against her Majesty in her realms, under the statute of Edward the Third, as that for which Ellis was committed by the magistrates, or intending to levy war against the Queen in her realms, in order, by force or constraint, to compel her to change her councils, which latter offence was first made a substantive treason by the statute of 36th Geo. III., cap. 7, which was made perpetual by a subsequent statute. You are well aware that as early as the 25th of Edward III., and thence down to the present time, the bare compassing or imagining the death of the Sovereign, when proved by any overt act, amounted to high treason. For, where the life or personal safety of the Sovereign is concerned, so precious has it always been held in the eye of the law, that the bare intention or imagining of putting it into jeopardy, although no injurious consequences followed from such intention, when proved by an overt act, itself alone constituted treason. Levying war within the realm, when proved by an overt act, is made a distinct substantive species of treason. But the mere compassing or intending to levy war, which is a mere purpose of the mind, was not treason until the 36th Geo. III., c. 7, and only such when the intent is expressed, uttered publicly, or declared by an overt act. Now, the only evidence of treason stated in the depositions, is the uttering of violent inflammatory words to assembled multitudes. But it is not the mere speaking of words, without reference to acts or design, no matter how wicked the words, that constitutes treason. The Judges, in the fourth year of the reign of Charles the First, when called upon to give judgment respecting words spoken by one Pym, certified that words, no matter how wicked they might be, did not constitute treason, unless they were made so by a particular statute. On the other hand, if the words of the speaker bore reference to any plan or design already laid, or are uttered by the speaker with a view of carrying into effect such plan or design, then such speaking or such uttering of words is an overt act of treason, being the means used to carry into effect such treasonable purposes. It will be, therefore, for you to say, supposing no further evidence is given than words uttered, if any previous plan to subvert the authority of the Queen or the established order of Government had existed, or whether, from the words spoken by the party charged with treason, you can feel yourselves authorised to infer that at the time he intended to effect such wicked purposes, and that the speech was made to induce his hearers to take up arms, and to use force or violenee, to carry such design into effect; you must determine for yourselves whether such is the safe conclusion to which you can arrive, or whether the words are not rather to be considered as the production of a heated imagination and distempered mind, thrown out at the moment rashly and hastily; "words as wicked as might be," as has been said in Pym's case, but which were spoken without any reference to any settled purpose. In the latter case it is not high treason, but a crime punishable as a high misdemeanour. I cannot close my observations without expressing the earnest hope of myself and my brethren that the administration of criminal justice under the special commission, in this, and other counties where similar enormities have been committed, may have the effect of teaching all, that the commission of crime will be followed speedily by its punishment, so steadily and so speedily, that the guilty can have no chance of escaping; and, secondly, whatever attempts may be made by discontented persons to subvert the laws and religion of their country, and to establish a new order of things in their stead, they will find the law too strong for them; and that the honest, virtuous portion of the community, and the lovers of peace and order, will unite with the authorities to repress these attempts, and put down such evildoers with a strong hand. And I would, in conclusion, venture suggesting, that the only effectual method of conquering the attempts of wicked and designing men to undermine the principles of the working men, and render them dissatisfied with the institutions of the country, is the diffusion of a sound religious knowledge (in which there can be no excess) amongst those classes who are the most exposed to these attempts, and of the fear and love of God; and that thus all may be taught that obedience to the laws is not a matter of compulsion, but a matter of principle and conscience. Gentletlemen, her Majesty's judges, besides, will be happy to render you any assistance that you may require in the discharge of your difficult duties.

The Stoke Riots.—The first case which came on was that of 29 prisoners, who were arraigned for a riot, and beginning to demolish the dwelling-house of the Rev. Benjamin Vale, on the 15th August, at the parish of Stoke-upon-Trent. They pleaded not guilty. The Solicitor-General addressed the jury for the prosecution. He recapitulated all the facts connected with the riots, as they had reference to the attack upon and the burning of the house of the Rev. Mr. Vale. He explained the law of the case as connected with the indictment against the prisoners, and concluded by calling upon the jury to dismiss from their minds all that they heard outside of Court, and to confine themselves to the evidence that would be adduced before them. Several witnesses were then called, who deposed to the principal facts as they were noticed in this Paper at the time of their occurrence. Counsel for the prisoners complimented the Crown lawyers on the mild manner in which the prosecution had been conducted, and after taking several technical objections to the form of the indictments, which were overruled by the Court, they addressed the jury for the defence. The proceedings ran to a great length, and the jury were locked up for three nights before the Chief Justice was able to sum up. His Lordship then commented on each case, desiring the jury to agree on their verdict as he proceeded, and calling on them to give the prisoners the benefit of any fair doubt that might arise in their favour. The announcement of the verdicts was reserved until all the cases had been decided, when the jury returned a verdict of "Guilty." Sentence was deferred.

CHESTER SPECIAL COMMISSION.—On Wednesday the special commission issued for the trial of the prisoners charged with offences in various parts of Cheshire, during the recent turn-out in the manufacturing districts, was opened with the customary formalities at Chester Castle. The judges appointed to try the prisoners are Lord Abinger, Sir E. H. Alderson, and Sir C. Cresswell. They arrived at Chester about 4 o'clock on Wednesday by railway, and, having been met by the sheriff of the county, proceeded to the Castle and opened the commission, after which the Court was adjourned to Thursday. The calendar contains the names of 66 persons: more than half are charged with taking part in an attack on the Stockport workhouse, and the rest are variously charged with assembling to disturb the peace, with conspiring to prevent, by intimidation and violence, other parties from following their lawful occupations, rioting, uttering seditious speeches, and conspiring to excite disaffection and discontent against the laws and government of the realm. A description is given in the calendar of the different degrees of education which the prisoners have received; from this statement it appears that about 18 can neither read nor write, 17 read imperfectly, 23 read and write, 7 read and write well.

TATTERSALL'S

THURSDAY.—The betting was confined to the Cesarewitch, for which several horses were backed at amounts barely large enough to determine their value in the market. On three only was business at all brisk, viz., Bellissima, Portrait, and Heslington; the mare was backed freely at 7 to 1, and closed at takers of a fractional improvement. Portrait had a few friends, but a strong feeling against him was shown in two or three quarters, and he finally closed at layers of 10 to 1. Heslington was backed in two instances at 10 to 1, and in several others at 12 to 1, with repeated offers to go on at the latter price. Latest prices:—

CESAREWITCH STAKES.

6 to 1 agst Bellissima (take 13 to 2)
10 to 1 — Portrait (tak. and afterwards offered)
11 to 1 — Heslington
12 to 1 — Blue Bonnet
12 to 1 — Florence
13 to 1 — Ralph (taken)
13 to 1 — Arcanus (taken)
16 to 1 — Tamburini (t. to small sum)
16 to 1 agst Muley Moloch colt
18 to 1 — The Gleaner (taken)
18 to 1 — Lucy Banks (taken)
20 to 1 — The Shadow (taken to 50*l.*)
20 to 1 — Thistle Whipper (tak. and afterwards offered)
6 to 1 — Blue Bonnet and Florence (taken)

MARK LANE, FRIDAY, OCT. 7.—The quantity of English Wheat offering is very small, and prices remain the same as on Monday.—Foreign is in fair retail demand at about the same rates: there is but little inquiry for bonded. Barley (excepting very superior quality) does not sell on quite as good terms.—Peas are unaltered, and Beans are rather lower.—In consequence of the small quantity of Oats, prices are maintained.

Pringle, and only daughter of the late Hon. E. J. Eliot, aged 56—On the 1st inst., aged 66, Magdalene, widow of the late T. Dowdeswell, Esq., of Pull Court, Worcestershire—On the 28th ult., at Bonnington, the Lady Mary Ross, widow of Sir C. Ross, of Balnagown, Bart—On the 21st ult., in Germany, aged 58, the Rev. J. Cracroft, Rector of Ripley, Yorkshire, youngest son of the late J. Cracroft, Esq., Hackthorn, Lincolnshire.

TO TULIP-GROWERS.

THE most complete directions for cultivating the TULIP IN PERFECTION are given in No. 6 of the GARDENER AND PRACTICAL FLORIST, price 3*d.*, published this day. London: R. Groombridge, 5, Paternoster-row; and sold by all Booksellers and Newsmen.

*** All Advertisements for the GARDENER must be sent to the Publisher one week before they can appear.

SHIP FOR NEW ZEALAND, under Charter to the New Zealand Company, to sail as under mentioned, viz.—
FOR WELLINGTON AND NELSON.
PHŒBE, 471 Tons, from London, 15th November.
For further particulars apply at the New Zealand House, Broad street Buildings.

TO FLORISTS, NURSERYMEN, AND OTHERS.—To be Let on Lease, a very desirable walled-in Garden, with Cottage. Greenhouses, large ranges of Brick Pits, &c. Rent low, and nothing of the kind in the neighbourhood; the Stock, Glass, &c., to be taken at a fair valuation. For particulars apply on the premises, Chester Gardens, near Chester-street, Kennington Cross.

HODGSON and ABBOTT'S PALE ALE.—The above celebrated Beer, so strongly recommended by the Faculty, is to be procured only from E. ABBOTT, Brewery, Bow, Middlesex. The Trade not being supplied, the Pale Ale cannot be genuine if procured elsewhere.
City Office, 98, Gracechurch-street.

WHEAT-SOWING.

POTTER'S ARTIFICIAL GUANO MANURE.—TESTIMONIAL:—"The ARTIFICIAL GUANO MANURE was applied with great effect to a heavy land, on the estate of A. Cotton, Esq., Hildersham Hall, Cambridge, on a Field of Barley; it produced a marked effect—the finest crop for years, and the produce, Six Quarters of Barley to the acre. The space marked out was conspicuous, being some inches higher than that from common Manure. On part of a Grass Field the application, which was but lightly made, produced at least double the proportion of Hay compared to the part otherwise manured. A portion of it was applied to the Orange Globe Mangel Wurzel, the roots of which were of very large size—double that of others,—and its effects on a bed of Parsneps was extraordinary, producing a crop exceeding any before seen. The exact weight per square yard, compared with those of ordinary culture, will be estimated when gathered. In the instance of the Parsneps, the Manure was mixed with earth, and deposited over the seed; a mode of culture recommended in the practice of Mangel Wurzel. Although much higher in price than the common Manure, the profit was materially greater."
Works, Upper Fore-street, London.

KEENE'S PATENT CEMENT.

THIS CEMENT is harder than any other known, and is especially fitted for the Walls of Hothouses, Conservatories, &c., as it neither cracks nor vegetates, and is perfectly impenetrable by insects.

The entire range of Hothouses erecting by the Government at Frogmore are about being stuccoed with it, and the price ranges nearly equally with the Cements in ordinary use for floors, and it forms a paving harder and cheaper than Portland Stone.

Patentees and Manufacturers, J. B. WHITE and SONS, Millbank, Westminster.

FORCING-HOUSES, &c.—To be Sold, the Lease of a very convenient Gardener's Dwelling-house, an excellent Hothouse and Greenhouse, with about an acre and a half of Garden, entirely enclosed with a brick wall; rent 35*l.* For full particulars, apply to Mrs. Jackson, on the premises, Church-street, Deptford.

WHITE TEETH. ROWLAND'S ODONTO, or PEARL DENTIFRICE.—This is an efficient White Powder for the Teeth, solely prepared from Oriental Herbs of the most delightful odour, and of sovereign virtue for strengthening, preserving, and thoroughly cleansing the Teeth. It eradicates tartar from the Teeth, removes spots of incipient decay, polishes and preserves the enamel, to which it gives a pearl-like whiteness; and, above all, from its disinfecting properties, gives sweetness to the breath. As an antiscorbutic, the gums also share in its transcendant powers. Scurvy is eradicated from them, and a healthy action and redness are induced, that offer to the notice of the medical practitioner the most indubitable signs of their healthful state. Price 2s. 9d. per box, duty included. *** NOTICE—The Name and Address of the Proprietors, A. ROWLAND AND SON, 20, Hatton Garden, London, are engraved on the Government stamp which is pasted on each.

*** Be sure to ask for "ROWLAND'S."

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, October 8, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

FUCHSIA ST. CLARE.

THIS, the most Splendid FUCHSIA yet introduced to public notice, will be ready for sending out in the second week of April next, at 10*s.* 6*d.* per plant, free of postage, to any part of the United Kingdom, by YOUELL and Co., who possess the entire stock of it. Dr. Lindley's opinion of it will be found in the *Gardeners' Chronicle* of the 14th of May last, as follows:—

"Your Seedling Fuchsia is by far the finest hybrid we have seen; the flower being three inches in length, with the tube and sepals of a bright carmine colour, and the petals of a rosy purple. If, as you say, it is a strong grower and a free bloomer, it will prove a valuable addition to this beautiful genus."

Which two latter qualities it possesses in the extreme. All orders, as well as those from the Continent, will receive every care in packing, so as to ensure their perfect safety. The usual discount to the Trade, where not less than six plants are ordered. For further particulars see their advertisement in the *Gardeners' Chronicle* of the 8th inst.

Great Yarmouth Nursery, Oct. 13, 1842.

CARNATIONS AND PICOTEES.

YOUELL & CO.'s Superb Collection of the above are now being sent out at the following prices:—

		£	s.	d.
25 pairs	of extra fine first-rate Show flowers,	5	0	0
12 ,,	do. do. do.	2	10	0
25 ,,	of fine Show flowers,	3	0	0
12 ,,	do. do.	1	10	0
25 ,,	of extra fine Show Pinks,	1	4	0
12 ,,	do. do.	0	12	0

The selection being left to Y. & Co.

Who, should it meet the wishes of those favouring them with their orders, will send them free to any part of the United Kingdom, at the extra charge of 2*s.* per dozen pairs.

A Post-office order, or reference, is respectfully requested from unknown correspondents.

Their Catalogue, containing every known variety worthy of cultivation, may be had by enclosing two postage stamps.

Great Yarmouth Nursery, Oct. 13, 1842.

ARAUCARIA IMBRICATA.

YOUELL & Co., who possess by far the largest stock in the country of the above most noble Hardy Plant, which is in course of planting by most of the Nobility, are executing orders for it in fine strong healthy Plants, at 60*s.* per dozen.

Great Yarmouth Nursery, Oct. 13, 1842.

CAMELLIAS.

CHANDLER and SONS, Nurserymen, Vauxhall, London, beg to state that they have young healthy plants of Camellia nitida now ready to send out at 3*l.* 3*s.* each. This is an imported variety, the flowers of a rose colour, with a white streak through each petal, and very double and compact.

C. and SONS can also supply good plants of C. Albertus at 1*l.* 1*s.* each; also fine healthy young plants of the following sorts, in collections of 1 dozen, viz.:—

Double White, Double Striped, Pompone, Pæoniæflora, Press's Eclipse, Fimbriata, speciosa, splendens, Chandlerii, Colvillii, Hume's Blush, florida—for 2*l.*, package included.

Elegans, Althæiflora, Corallina, eximia, imbricata, coronata, Spoffortiana, Woodsii, Rossii, miniata, Haylockii, Fordii—for 3*l.*, package included.

Bealeii, tricolor, Donkelaerii, serratifolia, regalis, triumphans, albicans, imbricata alba, Francofurtensis, rosea, elata, Colvillii striata—for 4*l.*, package included.

If individual sorts are selected from the above, the price of plants from the first collection will be 3*s.* 6*d.* each; from the second, 5*s.* each; and from the third, 7*s.* 6*d.* each.—A remittance, or reference for payment in London, will be expected from unknown correspondents.

PHLOX PICTA.

MESSRS. MOUNTJOY and SON beg to advertise the following Seedling PHLOX PLANTS, which will be ready for Sale by the 1st of next month; also a few Ground Roots of their Dahlia "Virgil," 105*s.* Phlox picta, white, with pink eye, 10*s.* 6*d.*; this was awarded a certificate of merit by the Horticultural Society. P. compacta alba, a very fine and distinct variety, 5*s.*; P. cordata maxima, very large purple, 5*s.*; P. liliacea grandiflora, pale lilac, very large bold flower, 5*s.*

A remittance is respectfully requested from unknown correspondents.—Ealing, 11th Oct., 1842.

TULIPS.

W. AND R. LAWRENCE, Hampton, Middlesex, beg to call the attention of Tulip-growers to their CATALOGUE OF CHOICE VARIETIES, which will be *sent free*, on application post-paid.

A SPLENDID SEEDLING PELARGONIUM.

R. JEFFRIES & SON beg to call the attention of the Public to their Seedling Pelargonium, Albert Prince of Wales, which they intend sending out in Nov. next, in strong plants, at One Guinea each. The colour of the lower petals is a fine deep rose pink, upper petals having an immense larg dark maroon spot, with a distinct broad pink margin, excellent trusses, flowers very large, beautifully cupped, good form, and of superior habit. Have been seen during the season by many first-rate cultivators, who have pronounced it a distinct and desirable variety. A remittance is respectfully requested from unknown correspondents.—Ipswich Nursery, Oct. 13, 1842.

NURSERY STOCK, &c., at JOHN CATTELL'S, WESTERHAM, KENT.

100,000	Transplanted	Ash, various heights, from 1 to 6 ft.
100,000	do.	Spanish Chesnut, 1 to 4 ft.
30,000	do.	Spruce Fir, 1 to 6 ft.
10,000	do.	Larch do., 6 to 10 ft.
10,000	do.	Scotch do., 1 to 3 ft.
10,000	do.	Common Laurels, 1 to 4 ft.
10,000	do.	Gooseberries (consisting of 40 named large varieties) and Currants, of sorts.

A very extensive Stock of large Forest and Ornamental Trees and Shrubs, in excellent condition for removal; also Standard, Dwarf, and Trained Fruit Trees, Transplanted Quince and Crab Stocks, for working; bedded plants of all the new and esteemed varieties of Rhubarb and Strawberries.

J. C. begs to say that his extensive collection of Standard and Dwarf Roses are exceedingly strong, and not to be surpassed, if equalled, by any other grower.

Also having been successful (owing to the favourable season) in saving seed of his splendid collection of Hollyhocks, he intends sending out his finest varieties at 6*d.* per packet; 12 distinct varieties, 5*s.*; 30 varieties, 10*s.*; fine mixed do., 1*s.* per oz.; a very superb variety of dark crimson Phlox Drummondi, at 1*s.* per packet, containing 8 seeds.

Also his usual Stock of HOME-SAVED Vegetable and Flower Seeds.

The above articles, in any quantities, will be delivered to the Edenbridge Station of the South Eastern Railway, for purchasers, carriage free.—Oct. 13, 1842.

SEEDLING CARNATIONS (never before sent out), TULIPS, &c.—DOVER'S PRINCE OF WALES, splendid Crimson Bizarre, white very good, colour good, form and petal first-rate.—(Vide Report of Floricultural Society of London, Aug. 6, 1842), 10*s.* 6*d.* per pair.

DOVER'S JEMMY WEBB, fine Scarlet Bizarre, took the second prize for Seedling Carnations at the Show of the Floricultural Society of London, July 19, 1842.—(See also Report of the above Society, Aug. 21, 1841), 7*s.* 6*d.* per pair. The Plants are very healthy. If six pairs are taken the trade allowance will be made.

Likewise, on very moderate terms, about 200 pairs of CARNATIONS and PICOTEES: also, a BED of TULIPS (60 Rows), with about 2000 Blooming and other Offsets, comprising the most esteemed Varieties, the whole the property of Mr. Dover, who is discontinuing their cultivation.

Address T. Ansell, Camden Nursery, Camden Town. A remittance will be required with orders from unknown correspondents.

DUTCH FLOWER ROOTS.

P. E. ERHARD, from Haarlem, begs to inform the Nobility, Gentry, and Connoisseurs of the above Flowers, that he has opened a DEPOT for the SALE of all kinds of DUTCH FLOWER ROOTS, *of the finest quality, carefully selected from his extensive Collection in Holland, at very moderate prices.* He feels assured that he is able to give the greatest satisfaction to those Ladies and Gentlemen who may favour him with their orders.—Depot, 359, Strand, corner of Burleigh-street.

THE FINEST VARIETIES OF HYACINTHS, IRISES, AND ANEMONES, AT VERY MODERATE PRICES.

	£	s.	d.
The finest Hyacinths known, per dozen	0	15	0
Very fine ditto, per dozen	0	7	6
Ditto ditto Mixed Double, per 100	1	1	0
Superb New Irises, best 30 varieties by name	1	1	0
Ditto ditto ditto Mixed, per 100	1	5	0
The New Large Double Anemones, by name, per 100	3	10	0
The same Varieties, mixed, per 100	1	1	0
Early Single, many colours, per 100	0	7	0

Gladiolus, Ranunculus, Ixias, Tulips, Crocuses, Jonquils, Narcissus, &c., &c., in extensive collections, at low prices, as per Catalogue. N.B.—Goods delivered, free of carriage, to the Railway Stations and Coach Offices in London.

Reading Nursery, Sept. 15.

ROSES.

H. LANE and SON beg to announce that their select annual descriptive CATALOGUE is now ready for delivery, and may be had *post free* on application (enclosing a 2*d.* stamp) at the Nurseries, Great Berkhampsted, Herts; at Mrs. Johnstone's, Covent Garden Market; and Mr. Nutting's, 46, Cheapside, London.

HEARTSEASE.—The following seedlings having been carefully selected by H. LANE and SON from their stock, are now ready for sending out for the first time, and they can strongly recommend them, viz., Sir John Sebright,* 7*s.* 6*d.*; Alpha,* 7*s.* 6*d.*; Christina, 5*s.* 0*d.*; Vulcan, 5*s.* 0*d.*; Venus, 5*s.* 0*d.*; Diana, 5*s.* 0*d.*; Nero, 3*s.* 6*d.*; Acteon, 3*s.* 6*d.*; John Fowler, 3*s.* 6*d.*; Signor Lablache, 3*s.* 6*d.*; and Calypso, 3*s.* 6*d.*, if taken singly; but if the whole are taken they will be charged only 45*s.*

Those marked * were awarded prizes at the Floricultural Society of London's Show on the 21st of June last.

THE MOST SUPERB DARK CHINA ROSE EVER OFFERED TO PUBLIC NOTICE—"MIELLEY'S PRINCE OF WALES."

WM. WOOD & SON have the honour to announce to their Friends and Amateurs in general, that they have purchased the entire stock of the above most magnificent Rose, and intend sending it out early in November, price for Dwarf Plants (on their roots) 10*s.* 6*d.* each.

The colour is of the deepest rich dark velvety purple violet, most perfect shape, beautifully cupped, large and very double, producing its elegant flowers on very strong footstalks; the habit is luxuriant and pleasing, with fine glossy foliage; it is perfectly hardy, and may certainly be depended upon as a Show Rose of first-rate excellence.

A discount of one third will be allowed to the trade if 6 plants or more are taken at once. Early orders are respectfully solicited, which will be executed in rotation as received.

A remittance or reference will be required from unknown correspondents.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

MYATT'S BRITISH QUEEN STRAWBERRY, after two years' competition, still maintains its pre-eminence: and, in returning thanks to their numerous patrons and friends, J. and W. Myatt beg to say they can with confidence recommend it as the most superb fruit yet known.

Also their new Seedling Strawberry Prince Albert, which for productiveness and size cannot be equalled. Price per 100, each, 50*s.*; and their Eliza, 20*s.* Runners are now ready, and may be had on application to them at Manor Farm, Deptford.

Myatt's famed Victoria Rhubarb, 50*s.* per 100 sets, or 1*s.* 6*d.* per root, will be ready in October.

PRINCE ALBERT PEA.

CORMACK and OLIVER, SEEDSMEN and NURSERYMEN, New Cross, near the Croydon Railway Station, and Bedford Conservatory, Covent Garden, London, have the honour to offer to the notice of Noblemen, Gentlemen, and others, the above new PEA, as one of the earliest and best sorts extant; in proof thereof, a quantity put into the open ground on the 14th of March last was ready for use the 25th of April following, being only *forty two days from the period of sowing to the date of gathering for the table*; it is moreover a good bearer, of excellent flavour, and highly advantageous for early forcing.—Packets, containing a quart, 5*s.* each.—September 30, 1842.

TANSLEY NURSERY, NEAR MATLOCK, DERBYSHIRE.

JOSEPH SMITH returns grateful thanks to his numerous friends for past favours, and begs to invite Noblemen, Gentlemen, and others, who may be improving their grounds, to his extensive and well-grown Stock of Forest Trees, Flowering Shrubs, Evergreens, Standard and Dwarf Roses, American Shrubs, &c. &c.

J. S. also begs further to state, that he has on hand upwards of 460,000 Transplanted Larches of various ages and size, stiff growers, and excellent Roots; 300,000 Transplanted Quicks, three, four, and five years old; 40,000 Common and Portugal Laurels; 30,000 Evergreen Privets; with many thousands of fine Rhododendrons for Cover and other Planting; and all other Nursery Stock in proportion.

Catalogues with prices may be had on application.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WILLIAM WOOD & SON beg leave to inform their numerous Patrons, and Rose Amateurs in general, that their NEW CATALOGUE OF ROSES, for the present season, is now ready for distribution, and will be sent, GRATIS, on application.

The immense Stock of Roses at Maresfield are this season finer and more luxuriant than ever; no pains or expense have been spared to render the collection as rich and unique as possible.

The General Catalogue of Nursery Stock and Trade List of Roses, &c., are also ready for distribution.—Sept. 21st.

J. SHEPPARD, NURSERY AND SEEDSMAN, WINCHESTER, begs most respectfully to call the attention of the Trade, and the Public generally, to the undermentioned articles, being such as he can fully recommend to give satisfaction:—Sheppard's Duke of Wellington Pelargonium, Sheppard's King David ditto, Sheppard's Isabella ditto, 10*s.* 6*d.* each; Sheppard's Queen of Beauty Pink, a fine Seedling raised in 1841, a first-rate Show Flower, 5*s.* per pair; White's Prince Albert Verbena, a splendid vivid scarlet, superior in colour to anything ever offered, price 2*s.* 6*d.* each plant.—Agents: Messrs. Warner and Co., Seedsmen, 28, Cornhill, London.

J. S. has on hand a fine Collection of Pinks, from 1*s.* per pair.

October 1st, 1842.

MESSRS. DICKSON, NURSERYMEN AND FLORISTS, Acre Lane, Brixton, beg to inform Amateurs and Florists, that their Catalogue of Carnations, Picotees, Auriculas, &c., is now ready, and may be had on application to them, or Messrs. Warner and Warner, Seedsmen, &c., Cornhill, London.

WOOD'S SUPERB SCARLET PHLOX DRUMMONDI.—The colour of this most beautiful of Annuals is a dazzling scarlet; the Flowers are perfectly round, without any space between the petals, forming, unexceptionably, the most brilliant and striking object that can possibly be imagined. J. Wood having grown no other sort, it is impossible that it can be deteriorated by impregnation. Packets, containing 12 seeds, 2*s.* 6*d.* each, postage included.

Nursery, Huntingdon.

N.B.—The above may also be had of Messrs. Warner and Warner, Cornhill, who saw it in bloom.

SOMERSTOWN SOUTHSEA NURSERY-GROUND.

TO BE SOLD BY PRIVATE CONTRACT, about 2 Acres of Freehold Land, with a good Stock on it; a good opportunity for a young man that wants to enter the Nursery Business. It is situated in a pleasant spot and a genteel neighbourhood, half a mile from Portsmouth and one and a half miles from Gosport South-Western Railway Terminus. On the ground is a Dwelling House, used as a Seed-Shop, Greenhouse 94 feet long, 2 Bricking Pits, &c.; it will be sold with the Stock, or without, if preferred.—For Particulars apply to Mr. Nobes on the Premises; or to Messrs. Minchin and Oaks, Solicitors, St. George's Square, Portsea.

TO DAHLIA GROWERS.

MR. GLENNY'S DESCRIPTION of the SEEDLING DAHLIAS of 1841 and '42; Prospects of attaining Perfection, and Means of promoting it.—The above Work will be published in the Second Monthly Part of THE GARDENER AND PRACTICAL FLORIST, price 1*s.*, the Proprietors of that Work having purchased the Copyright of Mr. Glenny. Advertisements must be sent to the Publisher, R. Groombridge, 5, Paternoster-row, before the 20th inst.

MILFORD NURSERY, NEAR GODALMING, SURREY.

THE Assignees of Mr. William Young having determined upon not having a Public Sale, invite the attention of Noblemen, Gentlemen, and Nurserymen in general, to the very superior and well-assorted and extensive Stock of Forest and Fruit Trees, Flowering Shrubs, Evergreens and American Plants, a large Collection of Orange-trees true to name, and extensive Stock of Camellias well furnished with flowering buds, together with a large and general assortment of Greenhouse Plants. To Gentlemen wishing to furnish a Conservatory, this opportunity ought not to be neglected, as the whole will be offered at reduced prices.

(Signed) John Noble, Thos. Elwin, M. Waterer.

TO NOBLEMEN, GENTLEMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by the Trustees of Messrs. Adamson and Son to submit to Public Competition by Auction, on the Premises, Stoke Newington Common, on Monday, Oct. 17th, 1842, and following days, at 11 o'clock, the whole of the valuable NURSERY STOCK ON THIRTY ACRES, consisting of Fruit and Forest Trees, Evergreens, American Plants, Deciduous and Ornamental Shrubs, of every variety, in considerable quantities; also, about 5,000 of Myatt's British Queen Strawberry, acknowledged by superior judges to be the finest in cultivation; about 200,000 Quick, Rhubarb, and Sea-kale, for forcing; a considerable quantity of Rotten Dung. The Stock may be viewed prior to sale. Catalogues, one shilling each, returnable to purchasers, may be had on the Premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

WESTBURTON, between Arundel and Petworth, Sussex. PINE PLANTS, Live and Dead Farming Stock, and a Life Interest in 803*l.* 5*s.* 6*d.* Consols.—To be Sold by Auction, by Mr. H. Salter (on the premises), by order of the Assignees of James Bisshopp, a Bankrupt, on Tuesday and Wednesday, the 18th and 19th Oct., 1842, at 11 o'Clock. The PINES consist of about 4,000 Fruiting and Succession Plants of the very best quality. The PINES produced from this Pinery have always been celebrated for their Growth and Quality, and have obtained the highest prices in the London Markets; and as a further proof of their excellency, they have constantly carried the first Prize at the Shows in London, where they have been brought into Competition with all England. Together with about Three Thousand Flower and Pine Pots.—The Farming Stock consists of 5 capital Cart-Horses, a grey Pony, 43 two-tooth Wether Sheep, 8 fat Pigs, and a quantity of excellent Poultry. A four-horse power portable Thrashing Machine, 2 narrow-wheeled Waggons, Dung-Carts, Corn-Cracker, Chaff-Cutter, 2 Ploughs, Drag-Rakes, Cyder-Press, Cloths, and other Effects. The Life Interest, of James Bisshopp, aged about 53 years, in the sum of 803*l.* 5*s.* 6*d.* 3 per Cent. Consols, standing in the names of Trustees, and producing an Annual Income of 24*l.* 1*s.* 10*d.*, will be offered precisely at Three o'Clock.

Catalogues will be ready 14 days previous to the Sale, and may be obtained on the premises; at Mason's Printing Office, High-street, Steyning; at Mr. Dulley's, fruiterer, Covent Garden; and at the office of the Auctioneer, Arundel. The Pine Plants and Farming Stock may be viewed the day previous to the Sale, and Particulars of the Life Interest may be obtained on application to Messrs. Ellis and Upton, Solicitors, Petworth.

In addition to the Farming Stock and Pine Plants, will be sold the whole of the Frame Work, Glass, Pits, and Apparatus thereto belonging, consisting of 8 Pine Pits, Hothouse, and several thousand feet of Glass.

The Farming Stock will be sold on the 18th, and the Pinery with the Life Interest, on the 19th.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. Bailey having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. Bailey also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. Bailey were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. Bailey have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their Manufactory.

HEATING BY HOT WATER.

JOHN WALKER, 46, St. John's Square, Clerkenwell, London, having been for many years extensively engaged in Warming Churches, Manufactories, Hospitals, Hothouses, Conservatories, and Private Houses, by means of Hot Water, either in Pipes or Pedestals, can confidently recommend this mode of heating in preference to any other. Numerous references can be given both in town and country, where he has successfully and satisfactorily applied it. Baths fitted up and heated in a superior manner. Orders executed in all parts of the Country with punctuality and despatch.

THE CONICAL HOT-WATER BOILERS invented by J. Rogers, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. Shewen having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

HOOKER'S BRITISH FLORA.

Published this day, 8vo., pp. 502, with 12 Plates, 14*s.* plain; with the Plates coloured, 24*s.* cloth,

THE BRITISH FLORA, Vol. I., comprising Phænogamous or Flowering Plants, and the Ferns. By Sir William Jackson Hooker, K.H. LL.D. F.R.A. and L.S., &c., &c. Fifth Edition, with Additions and Corrections; and 173 Figures illustrative of the Umbelliferous Plants, the Composite Plants, the Grasses, and the Ferns. In two Vols.—Vol. II., in two parts, completing the British Flora, 24*s.* boards.

London: Longman, Brown, Green, and Longmans.

THE ONLY GARDEN ALMANAC.

On November 1 will be published, price 1*s.*

HARRISONS GARDEN ALMANAC & FLORAL CALENDAR for 1843. All Advertisements intended for insertion must be forwarded to the Publisher, 66, Old Bailey, by the 26th inst.

This day is published, imp. 32mo, gilt edges, price 1*s.*,
Second Edition,

THE LADIES' HAND-BOOK OF KNITTING, NETTING AND CROCHET; containing plain directions by which to become proficient in those branches of useful and ornamental employment.

THE LADIES' HAND-BOOK OF FANCY NEEDLEWORK AND EMBROIDERY; containing plain directions whereby to become a perfect mistress of those delightful arts, Second Edition, Imp. 32mo, gilt edges, price 1*s.*

H. G. Clarke and Co., 66, Old Bailey, 6 doors from Ludgate Hill.

THE GARDENER and PRACTICAL FLORIST.—In Weekly Numbers, Price 3*d.*, and in Monthly Parts, Price 1*s.*, containing all that is new and valuable in Gardening and Floriculture. Published by R. Groombridge, Paternoster Row, by whom Advertisements and Communications for the Editor are received.—Sold by all Booksellers and Newsmen.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates. Price 2s. 6d.

PAXTON'S MAGAZINE OF BOTANY. The Number for October, 1842, contains highly-finished drawings of *Sophronitis grandiflora*, *Erica Neillii*, *Pentstemon crassifolius*, and *Echites atropurpurea*; likewise Papers on Gardening as a science; on Planting Shrubs in Beds; and the Preservation of Half-hardy Plants through the Winter. Floricultural Notices of new or beautiful Plants figured in the leading Botanical Periodicals for September; together with a complete Calendar of Monthly Operations for the Garden.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.

2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.

3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.

4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

DARLEY'S SCIENTIFIC LIBRARY, for the Use of Schools, Private Students, Artists, and Mechanics. It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the Public at large. To youth of either sex at public and private schools, to persons whose education has been neglected, or whose attention has not been directed in early life to such studies, and to Artists and Mechanics, these little Works will be found particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind, and brief for the memory; and the Elements of each Science are reduced, not only to their simplest, but to their shortest form.

1. A. SYSTEM OF POPULAR GEOMETRY. Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading Truths and general Principles. By George Darley, A.B. Fourth Edition, 4*s.* 6*d.* cloth.

2. COMPANION TO THE POPULAR GEOMETRY, in which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of Life, with numerous Cuts. (A Second Edition is now ready.) 4*s.* 6*d.* cloth.

3. A SYSTEM OF POPULAR ALGEBRA, with a Section on Proportions and Progressions. Third Edition. 4*s.* 6*d.* cloth.

4. A SYSTEM OF POPULAR TRIGONOMETRY, both Plane and Spherical, with Popular Treatises on Logarithms, and the application of Algebra to Geometry. Second Edition, 3*s.* 6*d.* cl.

"For students who only seek this limited knowledge of these sciences, there are perhaps no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra."—*Library of Useful Knowledge, Article "Mechanics."*

Taylor and Walton, Booksellers and Publishers to University College, 28, Upper Gower-street.

In one small volume, price 15*s.*

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopædias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, a Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur and Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

London: J. Andrews, Bond-street; Orr and Co., Paternoster-row.

FUN FOR THE FIRESIDE!!

Bound in cloth, price 5*s.* 6*d.*,

JOE MILLER'S JEST-BOOK. A Reprint from the first and genuine edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation; but, that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiæ.

Extract from the Preface.

"Another strange circumstance connected with this work is, that everybody presumes that he himself and everybody else are perfectly familiar with its contents ...... and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published."

London; Whittaker and Co.

WANTED, by a Nurseryman in the North of England, a Foreman in the Plant Department. The Principal will be in London from the 15th to the 22d inst., and may be heard of at Messrs. Noble's, Seedsmen, Fleet-street. No one need apply except those who have considerable experience and knowledge.

WANTS a SITUATION as GARDENER, a Single Man, aged 27, who thoroughly understands his business in all its various branches. Would have no objection to milk a Cow, or to look after five acres of land, if required. Can have a good character. Direct B.A., Post-office, Edmonton.

WANTS a SITUATION as GARDENER, a young Married Man, aged 30, without encumbrance, who can have a year-and-a-half's good character from his late employer. No objection to take charge of a horse and chaise, or to live in a cottage if required. A religious family preferred. Direct to W. Clark, Mr. Elmkine's, High-street, Homerton.

WANTS a SITUATION as GARDENER, or GARDENER and BAILIFF, a Married Man, under 40 years of age, without incumbrance, who well understands his business, is willing to make himself generally useful, and has no objection to go abroad. The best references can be given. Direct to A. M., 35, Queen's Liberty, Portman-place, Edgeware-road.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK informs Horticulturists generally, that the Cisterns, Tanks, Shelves, Stages, Conservatory Tubs, Flower-boxes, Edging for Garden-paths, &c., manufactured by him in Slate, may be seen in use at Worton Cottage, upon application to the Gardener.

Letters of inquiry will receive every attention.

SHIP FOR NEW ZEALAND, under Charter to the New Zealand Company, to sail as under mentioned, viz.—

FOR WELLINGTON AND NELSON.

PHŒBE, 471 Tons, from London, 15th November.

For further particulars apply at the New Zealand House, Broad street Buildings.

TO FLORISTS, NURSERYMEN, and OTHERS.—To be Let on Lease, a very desirable walled-in Garden, with Cottage, Greenhouses, large ranges of Brick Pits, &c. Rent low, and nothing of the kind in the neighbourhood; the Stock, Glass, &c., to be taken at a fair valuation. For particulars apply on the premises, Chester Gardens, near Chester-street, Kennington Cross.

HODGSON and ABBOTT'S PALE ALE.—The above celebrated Beer, so strongly recommended by the Faculty, is to be procured only from E. Abbott, Brewery, Bow, Middlesex. The Trade not being supplied, the Pale Ale cannot be genuine if procured elsewhere.

City Office, 98, Gracechurch-street.

WHEAT-SOWING.

POTTER'S ARTIFICIAL GUANO MANURE.—TESTIMONIAL:—"The Artificial Guano Manure was applied with great effect to a heavy land, on the estate of A. Cotton, Esq., Hildersham Hall, Cambridge, on a Field of Barley; it produced a marked effect—the finest crop for years, and the produce, Six Quarters of Barley to the acre. The space marked out was conspicuous, being some inches higher than that from common Manure. On part of a Grass Field the application, which was but lightly made, produced at least double the proportion of Hay compared to the part otherwise manured. A portion of it was applied to the Orange Globe Mangel Wurzel, the roots of which were of very large size—double that of others,—and its effects on a bed of Parsneps was extraordinary, producing a crop exceeding any before seen. The exact weight per square yard, compared with those of ordinary culture, will be estimated when gathered. In the instance of the Parsneps, the Manure was mixed with earth, and deposited over the seed; a mode of culture recommended in the practice of Mangel Wurzel. Although much higher in price than the common Manure, the profit was materially greater."

Works, Upper Fore-street, London.

KEENE'S PATENT CEMENT.

THIS CEMENT is harder than any other known, and is especially fitted for the Walls of Hothouses, Conservatories, &c., as it neither cracks nor vegetates, and is perfectly impenetrable by insects.

The entire range of Hothouses erecting by the Government at Frogmore are about being stuccoed with it, and the price ranges nearly equally with the Cements in ordinary use for floors, and it forms a paving harder and cheaper than Portland Stone.

Patentees and Manufacturers, J. B. WHITE and SONS, Millbank, Westminster.

THE PATENT ASPHALTE PROTECTING MATERIAL, spoken so highly of in the *Gardeners' Chronicle* for 1841, p. 100, 415, 530, and p. 8, for 1842, may be obtained in Sheets—32 inches by 32 inches, 32 inches by 64 inches, 32 inches by 96 inches, of Thos. Jno. Croggon, 8, Ingram-court, Fenchurch-street. A liberal discount to Hothouse Builders, Nurserymen, &c.

SHEEP NETTING, RABBIT NETS, FISHING NETS.—Strong tarred rope Sheep Net, 4½*d.* per yard, 3½ feet high, much approved for sheep-folding and for fences. Rabbit and Hare Nets on Cords, 50, 80 and 100 yards each, suitable for the purpose. Rabbit and poultry fence net, 1 yard high, tarred, 2*d.* per yard. Net for enclosing Pheasants, fowls, &c. Fishing Nets, viz., Flues, Trammels, Drags, and other Nets, from 4 to 400 yards long, ready for use. Net, 1-inch mesh, 1½*d.* per yard. Nets made to order of all kinds. ROBERT RICHARDSON, Net and Tent maker, 21, Tonbridge-place, New-road. N.B. 2,000 Second-hand Police Capes, for Labourers and Farm Servants, at 1*s.* 9*d.* and 2*s.* each, waterproof.

CAUTION TO FAMILIES.—The high reputation and consequent great demand of the undermentioned Articles have excited the avarice of some Shopkeepers, who, to get a trifle more profit, attempt to impose on the Public *highly-pernicious* Compounds as the real MACASSAR OIL for the hair, and KALYDOR for the complexion: they copy the labels and bills of the original Articles, substituting either an *assumed* name, or the word GENUINE in the place of ROWLAND'S.—⁂ To frustrate such imposition it is necessary, on purchasing either Article, to see that the word "Rowland's" is on the wrapper as follows:—ROWLAND'S MACASSAR OIL, price 3*s.* 6*d.*; 7*s.*; or Family Bottles (containing four small), 10*s.* 6*d.*; and double that size, 21*s.* per bottle. ROWLAND'S KALYDOR for the Skin and Complexion—Price 4*s.* 6*d.* and 8*s.* 6*d.* per bottle. "A. Rowland and Son, 20, Hatton Garden, London," is written in red on the wrappers of the MACASSAR OIL and KALYDOR, and engraven on the Government Stamp affixed on the Kalydor. Be sure to ask for ROWLAND'S ARTICLES. Sold by them and by respectable Chemists and Perfumers.

HORTICULTURAL SOCIETY OF LONDON.

EXHIBITIONS AT THE GARDEN.—This is to give Notice, that the latest day for receiving Suggestions as to the manner of arranging the Prizes, is the THIRTY-FIRST OF THE PRESENT MONTH; immediately after which the Committee will proceed to settle the Prizes for next year.

21, Regent-street, Oct. 14, 1842.

The Gardeners' Chronicle.

SATURDAY, OCTOBER 15, 1842.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Monday, Oct. 17	West London Gardeners'	7 P. M.
Tuesday, Oct. 18	Floricultural	7½ P. M.
Wednesday, Oct. 19	Microscopical	8 P. M.
Saturday, Oct. 22	Royal Botanic	3½ P. M.

IT will have been seen, from a report of the proceedings of the Floricultural Society, published in our columns of last week, that two members of that Society have been expelled for fraudulently manufacturing a Dahlia, with intent, &c.; and that certain other parties have been disqualified for exhibiting on any future occasion, in consequence of their having been abusive and quarrelsome. We had no intention of occupying ourselves with these matters, which the people who are implicated and the Society must settle with each other; but since one of those concerned in the last-mentioned affair has thought fit to appeal to us upon the subject, we shall take the present opportunity of expressing our own opinion of such transactions in general, without any reference to the present case; merely remarking that if the facts are as stated, the Floricultural Society have acted perfectly right in dealing with the offenders promptly.

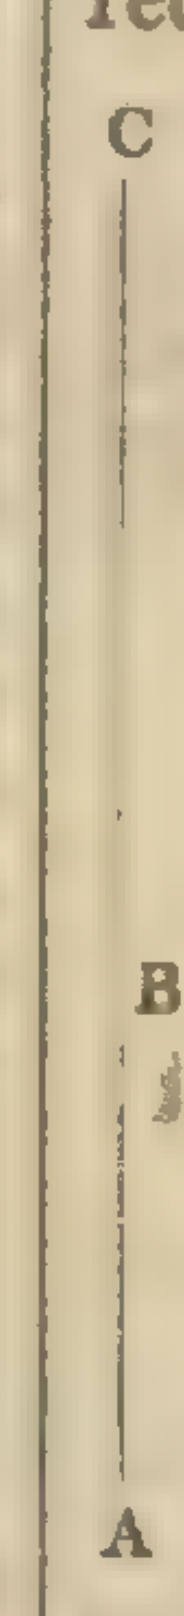
And first, with regard to the cheating. We know there are people in the world whose notions of right and wrong are so lax, that they imagine the character of an act to depend upon the circumstances connected with it, and not upon its own nature. One man will cheat his neighbour in selling him a horse, but is indignant if suspected of picking a pocket. Another will rob you without scruple of literary property, who would not swindle you out of a landed estate. And there are those who think it venial to be rogues at a flower-show, but would transport a man for thieving in a shop. We are justified in suspecting such persons of regulating their actions, not by any known standard of honesty, but by a fear of the consequences. If cheating can be practised with safety, it is laudable; if with danger, it is iniquitous. They have no objection to rob, but they do not like the hanging. A man who tries to swindle at a flower-show is as great a rogue as he who is transported at the Old Bailey for rascality of some other sort. Such people are to be avoided like a pestilence by honest men. If they do not cry "Stand and deliver!" it is because they are afraid of the police. Gardeners will find their own characters much damaged in the eyes of their employers if they are known to associate with flower-cheats.

As to brawling at horticultural exhibitions, that is a very different offence. Infirmity of temper, imaginary provocation, or natural brutality, uncontrolled by education, will lead men, in heat of blood, to express themselves in a manner which they themselves, in a cooler mood, would not venture to justify. For this we would make some allowance; certainly we cannot admit the expediency of treating it with the same severity as cheating. At the same time, offensive language, abusiveness, or violent explosions of temper, are not to be tolerated in any kind of society, and must be put down wherever they occur. Nothing conduces so much to the pleasure of all meetings, whether horticultural or not, as good humour, and a total avoidance of offensive language, even under provocation. In private society this always *is* insisted on, and in public society ought to be. Gardens are not intended for scenes of strife. It is in gardens that the serenity and beauty of the creation are best exhibited: to introduce into them violence and outrage is an offence against the harmony of nature. If ever there was a pursuit calculated "to soften our manners and unbrutalise mankind," it is pre-eminently gardening: those who convert it to other purposes, from whatever causes, must not wonder if society marks its reprobation of their acts in a very unpleasant way. One of the persons now punished by the Floricultural Society assures us, that "he never so far forgets himself (as to use abusive language), unless he has great cause for doing so." We would advise him in future to take care not to forget himself at all.

IN Mr. Clement Hoare's excellent Treatise on the Vine, there is not a more valuable chapter than that on autumnal pruning. His directions are—to effect the pruning completely, as soon as the fruit is gathered. The whole of the last bearing-wood, *leaves* and all, is to be removed *immediately* after the fruit is gathered. His object is to concentrate sap in the buds that are left for fruiting next year.

At first sight this practice may seem objectionable, because it is to the leaves of a plant that we must look for its vigour; and therefore to abstract the leaves should diminish its vigour. But a little reflection will show that this is not the case under the circumstances in which a Vine is placed at this time of the year.

So long as the leaves are in full activity, it is wrong to remove them; but at the end of the season their peculiar offices are nearly at an end, their powers of life become languid, and they add but little to the matter which a tree contains: they do however add *something*, until they die. But it may be, that less is added by the leaves than is consumed by the parts that bear them; and if so, to leave them is a loss. This is really the case with a Vine, which will go on growing and forming wood *that is not wanted*, as long as the season will permit. It is, in part, to prevent its going on forming what is not wanted, and has to be thrown away, that early autumn-pruning is to be recommended.



Let us imagine the unpruned branch of a Vine to be represented by the line A C, and that in pruning it is shortened to A B. A, the root, will supply a certain amount of sap to the whole line A C; but if B C is removed, that supply will be directed to A B only, and consequently the buds on A B will receive all that sap which they would have had if the Vine had been unpruned, and all that, in addition, which would have been consumed by B C.

Now the formation of the buds depends upon the quantity of sap they receive; and therefore those buds which receive the most sap will be the most completely formed. In all cases, the effect of stopping a branch is to throw into the buds that are left a larger quantity of sap than they would otherwise have received; and hence the advantage to fruit-trees of summer pruning. But if the operation of pruning or stopping is performed too soon, the formation of the buds will be carried so far, that they will actually burst and protrude the new branches; and thus much mischief will be produced. The Vine is peculiarly liable to this; and hence it is that the final pruning is not recommended until the rate of growth is so much diminished as to remove all danger upon that head; but the moment that danger ceases the pruning should take place.

In such an instance as this, the leaves on B C will add little to the vigour of the tree, because of the lateness of the season; but B C, eventually to be thrown away, will be fed at the expense of A B, which is to be preserved; and therefore B C should be pruned off as soon as it is safe to do so.

For the reasons why autumn-pruning is generally advisable, we refer to the *Theory of Horticulture*, p. 259.

IN a late number of the "Gardeners' Magazine," Mr. Loudon mentions its being the practice at Nettlecombe, in Somersetshire, to collect the young shoots of Fern as a food for pigs. A cottager is represented as asserting that Fern is as nutritious to those animals as Potatoes, and that a pig fed upon it for a month would be in as good condition as if it had been kept on Potatoes for that time. "The way to prepare the Fern is to boil (or rather simmer) it for two hours in an iron pot; when cold it forms a strong jelly."

This little fact is, we think, of sufficient importance to be made generally known; for it seems to offer the labouring poor one more means of increasing their amount of personal comforts. That Ferns are nutritious there is no doubt; they contain a large quantity of starch, the nutritious principle of the Potato, the Yam, the Mandioc, and to a great extent of Corn; but in Ferns it is much mixed with astringent matter, disagreeable to the human palate; and therefore Ferns are not used for food for man. Nevertheless, in countries where better food cannot be had, the Fern supplies a diet by no means to be despised, and much employed by the rude natives. New Zealand, New Holland, and some of the South-sea Islands, are more especially countries where the Fern is one of the common articles of food; and we can hardly doubt that what will sustain the life of man in one hemisphere, will be good enough for pigs in another.

MEASURES OF CAPACITY.

WE beg to add the following to what has already been stated upon this subject in our last number:—

"The difference between a Winchester gallon, derived from the standard bushel and the standard quart, was 13 and 2-tenths cubic inches, equal to a difference of 105 and 6-tenths cubic inches in the bushel;" showing that, after all the philosophical ceremony of defining the capacity of a bushel to the thousandth part of a cubical inch, there was a practical failure in carrying out the standard, to the great amount of nearly 106 cubical inches between the bushel derived from the standard quart, and from the standard bushel.—*T. N. P.*

ON PRUNING ROSES.

THE Briar is a plant that may be considered distinct in its habits from almost all others, and the difficulty in dealing with it (if such it may be called) arises from its inclination to form new leaders more vigorous than preceding ones. These—unlike most other shrubs which grow at the points of their shoots at particular seasons, and after adding to their extreme length first a spring and then an autumn shoot, throw their branches around them in symmetrical evenness—either proceed as suckers directly from the ground, or spring up from the sides of the original plant; the juices of which appearing to increase upon it faster than they can be expended by a mode of growth habitual to other shrubs, force their way through a fresh channel, and throw up the strong and thick shoot, whose formation as to time seems to have greater reference to the vigour of the individual plant than to the season.

It is the shoot and not the original stem which is desired by the gardener; and when it comes into his hands, he treats it in a very different manner to that which would be successful with trees in general, by cutting off every branch and shortening the roots. In this state it is re-planted as early in the season as possible, and down its sides and at its summit the rudiments of the future branches show themselves early in the spring. These, permitted to grow to the desired number only, are worked; in the succeeding spring the wild shoots are cut away, excepting a single eye (beyond the inserted bud), which is retained in order to keep the sap moving through the whole length of the shoot, and the entire vigour of the plant is eventually thrown into the inserted bud. When a free-growing variety has thus the vigour of a well-rooted stock devoted to it, the increase is prodigious; yet, notwithstanding this, if the shoots be permitted to grow unstopped, it will produce in many instances as fine if not finer flowers the first year as at any subsequent period. If, however, a head be desired, the shoot is nipped off the first year to perhaps half an inch—a process detrimental to the flower of that season.

The succeeding year the plant, in its utmost health and vigour, comes under the pruner's hand, and a degree of skill and consideration is then required much more than commensurate with the knowledge and habit of the common gardener; whose object in pruning is generally this, viz., to procure from the plant the best show of bloom at the cost of the least possible trouble. To do this he leaves on his trained plants a certain quantity of ripe wood frequently unshortened, from which he knows that flowers will be obtained, and he forces the sap into that particular channel by cutting out the other branches entirely.

The result of such treatment is this:—The tip of the branch left generally dies and becomes unsightly; a moderate quantity of very moderate bloom is produced upon the stock, whilst on the base of those which have been cut away, green and brittle branches are thrown out, different in hue from the rest of the plant, whose appearance they deform, while they rob the flowers of their nourishment. With standards a certain number of stocks are partially shortened; the remainder are cut away as above, and the plant is expected to form flower and fill itself with wood in some manner and shape, but exactly how, and precisely in what shape, does not come under consideration. Thus, the symmetry of the head is injured, the flowers are unevenly placed, and are, moreover, inferior both in quantity and quality; some dead wood deforms the plant, and unnecessary wounds are left on it.

In order to arrive at the most advantageous mode of pruning, it is desirable to examine, as far we are able, into the operations of nature, that we may follow her laws, and interfere as little as possible with the process going forward.

We are desirous to continue and confine the ascent of the sap to the head then in being, *i. e.*, to that which has sprung from the inserted buds. To do this, we must not only destroy side-shoots and suckers, but find for the sap a free channel to flow in, and preserve the ripened wood to secure a future bloom; whilst the balance must be kept up by permitting no shoot to grow to the comparative stagnation of the rest, for if the sap travels too freely there will be little flower, and if too slow, but little growth.

The calculation I have always acted upon, and I think with success, is this:—How many buds can the tree work with vigour? Suppose the answer to be two to every branch upon it, I cut away in the spring all the buds of last year's growth, except those I wish to work; thus starting the buds at the base instead of at the summit of the shoots, taking care, as far as I can, not to leave green and useless wood in one stock, and a hard and too woody base to another, but endeavouring to keep the sap in its accustomed channel and regularly distributed. Thus, a symmetrical head is obtained, and such shoots as do spring from the buds may occasionally be preserved, and so pruned from time to time as to keep the plant near home; it is surprising how successfully this careful mode of pruning will make a tree bloom, even under most disadvantageous circumstances.

I have at this moment two plants of the Bengal florida, the wood of which cannot be parted with, as it ornaments a verandah; upon each of these, respectively, I have placed a bud of Lamarque and Madame Desprez, and the shoots from them have been carried up the centre as leaders. Every spring the Bengal florida flowers freely, and when this bloom is over, the Lamarque and Desprez come into flower. Although the wood in the former is delicate, and requires management, it has never yet failed for several years, and is ornamental to the end of autumn. No comparison can be instituted between the flowering of this plant, and another in a similar situation, and in the same aspect; but which, pruned in the ordinary way, with a large quantity of wood left on it, produces but little bloom, and that little bad.—*A Practitioner.*

(To be continued.)

ENTOMOLOGY.—No. XXXV.

The Slug-worm or Slimy-caterpillar is the larva of a Saw-fly, called by Linnæus *Tenthredo Cerasi* from its feeding upon Cherry-trees. There are few gardeners, growing Pears or Cherries, who are not acquainted with these annoying animals, which, by destroying the foliage, occasionally injure the size and flavour of the fruit very considerably, and likewise rob the owner of a crop the following year; it appears that they feed also upon the leaves of Plum-trees, Hawthorns, and Sallows, from the middle of August to the beginning of October. These very singular and inactive caterpillars are more like little black slugs or tad-poles, than the larvæ of a Saw-fly, being entirely covered with a slimy matter which gives them a moist and shining appearance, and when at rest upon the foliage they might easily be mistaken for the droppings of Sparrows or Swallows: upon a closer examination they will be found to exhibit the typical characters of the family to which they belong, having 6 pectoral and 14 abdominal feet, but no anal ones; they are of a deep bottle-green colour; the thorax is dilated, being very much thicker than the rest of the body, and concealing the head, or nearly so (fig. 1): when feeding they elevate their tails, and discharge the little black excremental pellets to a considerable distance. It is not a little remarkable that they feed entirely on the upper side of the leaves, consuming the parenchyma, and leaving only the nervures and the lower cuticle, which is rarely perforated. I believe they often retire beneath the leaves in the day, to avoid the rays of the sun, and to change their skins; at night they wander about in search of fresh leaves, which are better suited to their tastes than the withered and half-eaten ones. Their slimy coats also protect their tender bodies from heat and wet, as well as from the attacks of parasitic flies, and by the adhesive nature of their secretion they are less liable to be shaken off the smooth leaves by the boisterous winds of autumn.

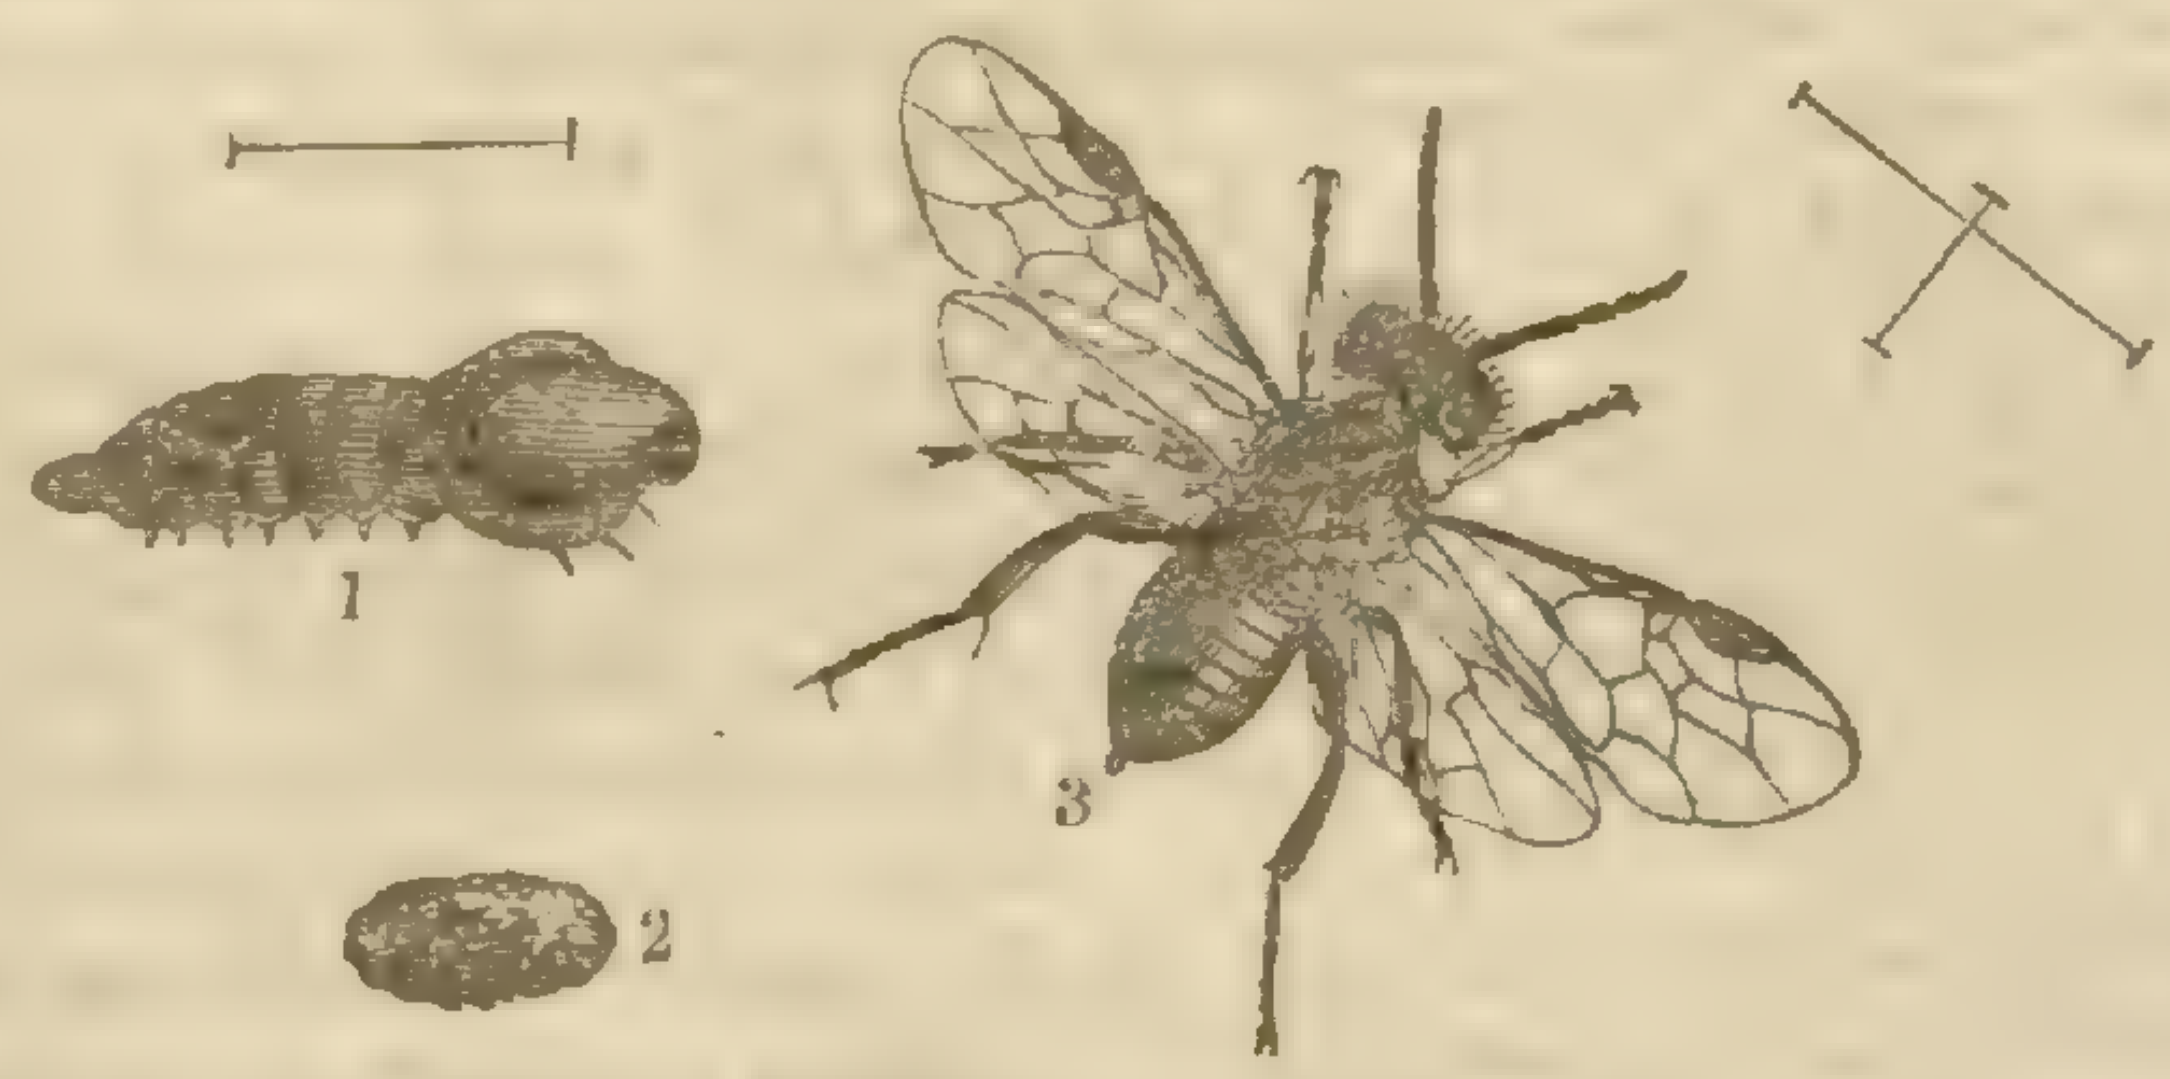
After four or five weeks, when they have arrived at their full growth, they cast off their bottle-green jackets, and then appear in a suit of buff, being entirely changed in their appearance—they no longer shine, neither are they smooth, but covered with small transverse wrinkles; this operation took place, almost simultaneously with my brood, the 5th of Oct.; and a short time after, they left the leaves, for the purpose of entering the earth, where they spin an oval brown cocoon, composed of silk, with grains of the soil adhering to the outside (fig. 2), and lined, according to De Geer, with pure black silk. Towards the end of July, after having lain dormant nearly ten months, the flies emerge from their tombs.

Tenthredo Cerasi, which belongs to a group called by Dr. Leach *Selandria*,* is supposed to be the *T. Æthiops* of Fabricius and Klug. The female (fig. 3) is of a shining black, with a violet tint; the head and thorax are pubescent; the horns are short, pointed, and composed of nine joints; the ovipositor is nearly concealed: the wings are often more or less stained with black; the nervures are darker; the costal margin and stigma are brown; and there are 2 marginal and 4 submarginal cells in the superior: the 4 anterior legs are brownish ochre, and the others are more or less of that colour, but generally much darker, and the thighs, or at least the base, are pitch-colour: the lines exhibit the natural dimensions of the fly and of the larva. The eggs are deposited on the upper side of the leaves, probably under the skin; they are oval, and of a clear yellow colour: the young larvæ are hatched from them in a few days.

As there are several species of *Selandria* closely allied to the *T. Cerasi*, it is exceedingly probable that their larvæ are alike in their nature; and this opinion is strengthened by various Slug-worms being found at very different periods, and upon a variety of trees. I am even inclined to believe that there may be two sorts which feed upon Pear leaves, for towards the end of July, and at the commencement of August, I had some dull ochreous larvæ sent to me, eating the leaves in the usual way, with *black heads* only, and when they changed their skins they became entirely of a deep and bright ochreous colour; with these I observed a minute very hairy Acarus running over the leaf, and two of them ran under the larvæ, which caused them to throw up their tails several times with a jerk, from which it seems probable that they infest the Slug-worms.

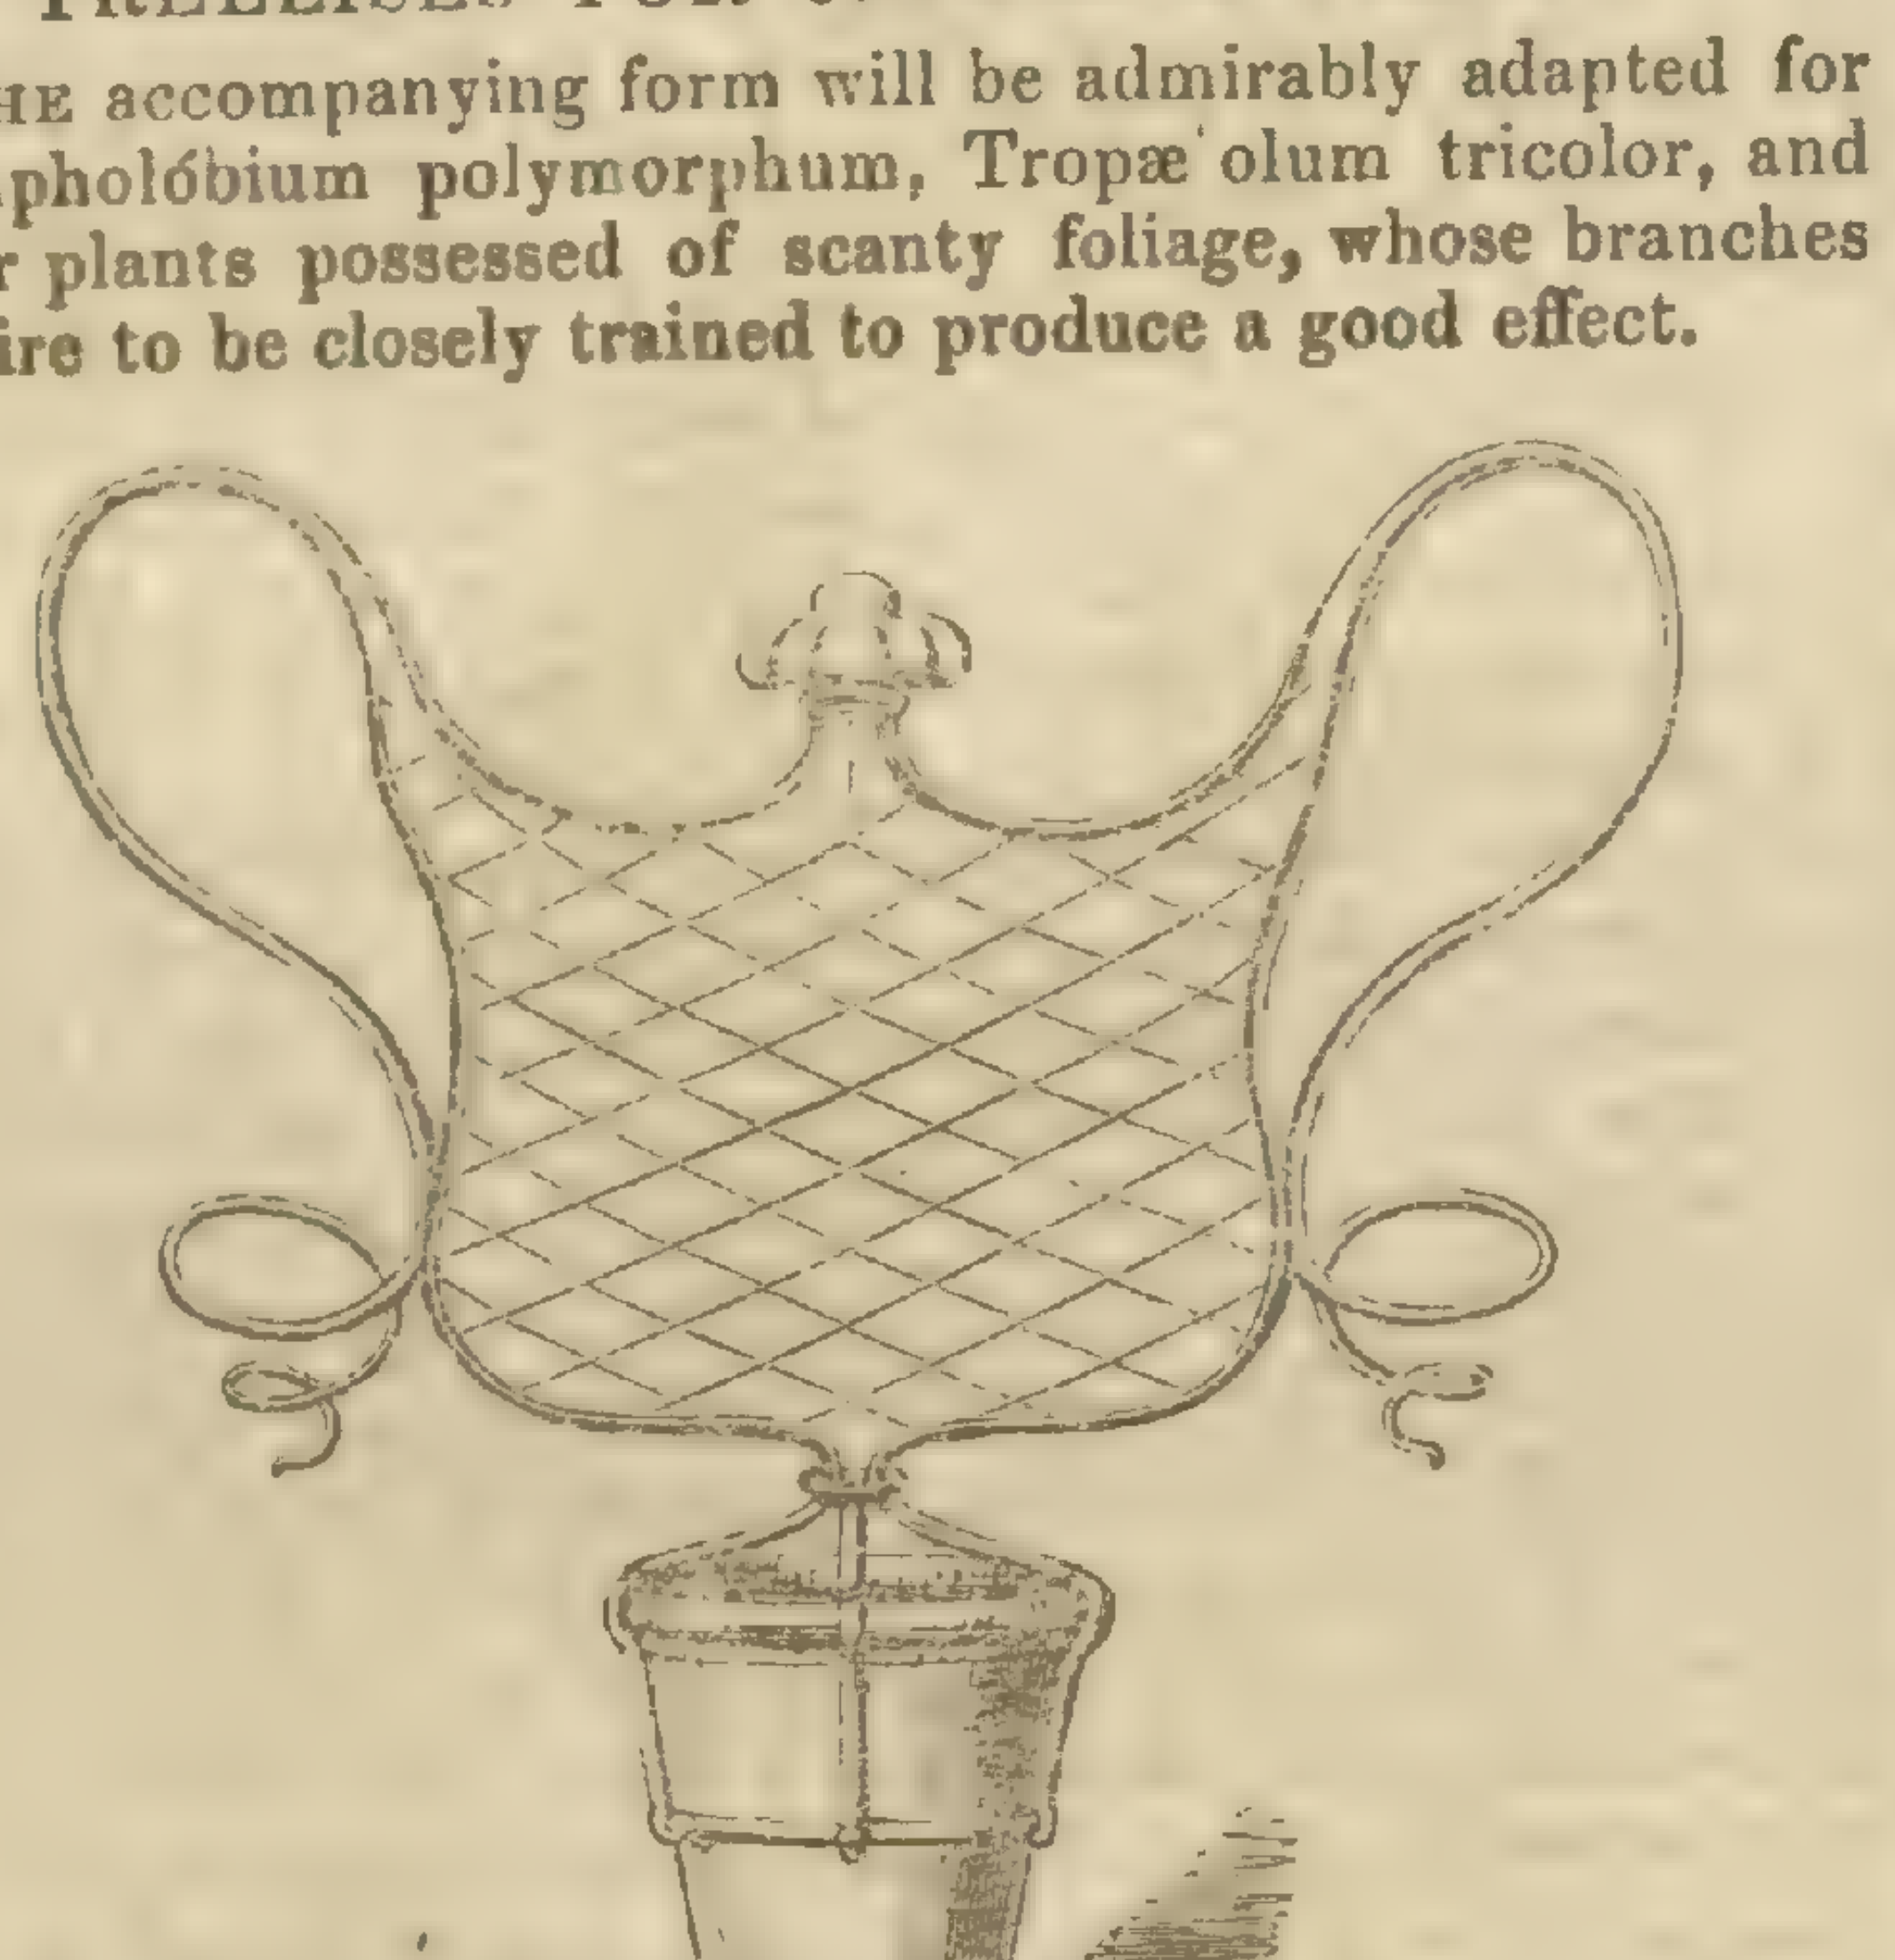
This, or a similar larva, threatened to destroy the Pear, Quince, Plum, and Cherry trees in North America, at the close of the last century, as many as 30 being found upon one leaf. When they abound to such an extent, the trees send forth a sickening and disagreeable scent, by which alone the presence of the Slug-worm may be easily detected.

Several remedies to relieve our orchards from the attacks of the Slug-worm have been tried, but a great deal must depend upon the period when, and the manner in which, they are applied; and this will often account for the complete success of an experiment with one gardener, whilst another fails altogether. Dusting the infested trees with quicklime is certain death to the larvæ, especially in their earlier stages; but it ought to be repeated once or twice, as they change their skins, and can thus, like slugs, get rid of the noxious matter with their slough for the first time, but not so at the second dusting. On a small scale, the powdered and unslaked lime might be scattered over the leaves with a tin box, having a number of holes in the lid, like a dredging-box; and on a larger scale a fine sieve might be used, by a man on a ladder or steps. A decoction of tobacco-water, about a quarter of a pound of tobacco to two gallons of water, thrown over the trees with a garden engine, will destroy them. Some persons have employed lime-water with complete success: about a peck of lime to 30 gallons of water, and if 2 lbs. of soft soap be added, it will improve the mixture. The best periods for applying these liquids are before 7 in the morning, and after 5 in the evening; the syringing should be repeated until the trees are free from the Slug-worm; they may afterwards be washed clean with pure water, and if the lime-water be used in the evening, the cleansing may be deferred until early the following morning.—*Ruricola.*



TRELLISES FOR CLIMBING PLANTS.

The accompanying form will be admirably adapted for Gompholóbium polymorphum, Tropæolum tricolor, and other plants possessed of scanty foliage, whose branches require to be closely trained to produce a good effect.



As it appears that some persons find a difficulty in securing these trellises to the flower-pots, a woodcut is in preparation to show the manner in which it is performed.

ON ANIMAL MANURES.—No. IV.

(By Professor Charles Sprengel. Translated from the German.)

(*Continued from page 668.*)

3. *Blood.*—In the vicinity of large towns, great quantities of blood are at times to be got at a cheap price. Such an opportunity ought never to be neglected, for blood is a very powerful manure. Of all the animal offal it is the quickest to decompose, on which account it must be carried immediately upon the land, and either lightly ploughed in or mixed with humous earth, so that the ammonia, which is soon developed, may not be lost. The rotten mixture is best used as a top-dressing. The value of the blood results from its chemical ingredients; it consists of 9½ per cent. of manuring substances, and on that account is twice as valuable as the urine of cattle, for it possesses more than twice the amount of nitrogen. The blood of oxen contains in 100,000 parts—

90,500	parts of water.
7,990	. . albumen.
0,618	. . osmazome, with lactate of soda.
0,256	. . muriate of soda (common salt) and muriate of potash.
0,152	parts of mucous matter and a little soda.
0,484	. . caseine, gall-fat, suet, fat oil, a sort of fatty acid, phosphate of lime and iron.
100,000	parts.

Blood of sheep contains only 83 per cent. of water, and is therefore better than blood of cattle. The main effect of blood is owing to the nitrogen of the albumen, osmazome, caseine, and mucous matter.

4. *Horn.*—Horn, or rather horn-shavings, viz., the refuse which arises from the working of horn, has been long known as a powerful manure. It is not, however, much used in agriculture, on account of its scarcity and high price, and also because it is greatly sought for by gardeners and florists. The extraordinary effect which horn-shavings produce is derived from their amount of nitrogen; for they chiefly consist of hardened albumen*, which contains 15½ per cent. of nitrogen, and possesses moreover 8 per cent. of organic substances, in which nitrogen is to be found. By burning, horn-shavings yield but $\frac{3}{10}$ per cent. of ashes; therefore their mineral ingredients are not to be taken into account, although they are sulphur, phosphorus, chlorine, potash, lime, and soda. 100,000 parts of horn consist of—

90,000	parts of albumen.
8,000	. . an animal substance, soluble in water, and containing nitrogen.
1,000	parts of fat.
1,000	. . lactic acid, the phosphate, sulphate, chloride, and lactate of potash, phosphate of lime, and traces of iron.
100,000	parts.

It is assumed, that 300 lb. of horn-shavings will manure as much as 12,000 lb. fresh dung (= 2,000 lb. of dry); this, however, is a very uncertain estimate, because the quality of the dung must be taken into account. In the cultivation of Rye it is customary to use of horn-shavings eight times the volume of the Rye which is employed as seed; and therefore from 450 lb. to 500 lb. of horn-shavings would be employed on the Magdeburg acre. If 500 lb. are applied, the acre will thus receive 75 lb. of nitrogen, which is as much as 1½ crop of Rye contains. This explains the transient effects of horn-shavings, and it also explains why, if they have been used in greater quantities, the crop will be laid. If the horn has been reduced to a small size, it will be very soon decomposed; and being dissolved by water, the plants will receive more nitrogen than they can assimilate. But if plants are to derive the greatest advantage from any one substance, they must have an opportunity of supplying themselves with a proportionate amount of all other substances they are in want of. That it is really nitrogen which often makes plants grow rank, is exemplified by all those manures which contain a great quantity of nitrogen; as, for instance, urine, blood, offal, nitrate of potash or soda, nitrate of ammonia, humate of ammonia, &c. If larger pieces of horn-shavings are used, their effects will last more than one or two years, as they will not be so quickly decomposed.

Horn-shavings are strewed over the growing crop, or are laid on the ridges in which the crops grow. It is always best to use horn-shavings with those plants whose growth is compatible with much nitrogen in the soil; as, for instance, Rape, Cabbage, Tobacco, Potatoes, Turnips, &c. If it is intended to lose no nitrogen, they must be allowed to rot mixed with humous earth, and must be used as a top-dressing. In England they are mixed in ditches with quicklime and earth until they are rotten, and the compost thus obtained is used as a top-dressing. By this means, however, the ammonia extricated from the albumen is lost; for which reason that method is unworthy of imitation. The hoofs of cattle may be had easier than horn-shavings: they contain the same substances, and therefore are equally powerful manure. The only thing which interferes with their use is the great trouble of reducing them into small pieces, which, however, might be easily obviated by machinery, which could be equally applied to reducing the hoofs of horses. For the want of such a machine, the hoofs are mostly mixed with lime and earth, and left to rot in a ditch until nothing of them is perceptible: by this means, however, if they are not mixed with much humus, a large proportion of the ammonia is lost. In meadows and moors, hoofs may be used with advantage, by thrusting their pointed parts in the moist soil to such a depth that they may not interfere with the mowing of the grass. Water will collect in the small holes thus formed, by which means they are gradually decomposed, and produce during two or three years a very luxuriant crop of grass. From 800 lb. to 1,000 lb. may be used for an acre, if we assume that one hoof weighs ½ lb., and would be placed at each two feet square. It is very objectionable to put hoof or horse shavings into tanks of urine to rot, for urine contains already more than a useful quantity of ammonia.

AMATEUR'S GARDEN, No. XLII.

A fortnight ago I told you, that although Rhododendrons and other American evergreens are generally planted in heath-mould, it is in many cases not indispensable to them, particularly if they are properly planted. If you are satisfied, however, that the natural soil of your garden is not suitable, and have heath-mould prepared as I formerly directed, you may proceed in the following manner:—First of all study carefully the position in which the clumps are to be placed; for much of the beauty of a garden depends upon the general effect which is produced. Having settled this, and the site of the clump or the border, take out the natural soil from 14 to 18 inches deep, and fill the space up with the prepared heath-mould rather higher than the surrounding ground. Tread it lightly down, and leave it to settle for a week or two, until the proper time for planting arrives. This operation may be performed as soon as the weather becomes showery, for in this case the plants are not so liable to suffer in their removal from the nursery. Let the fibres of the roots be carefully preserved when they are taken up, and as carefully spread out in the hole which is made for their reception. If the plants have been growing in pots, the latter point ought to be particularly attended to; otherwise the rootlets will not grow readily outwards into the soil, and the ball of earth which surrounds them will be very apt to get too dry. Do not plant deep; if the necks of the plants are barely covered, this will be quite sufficient. Instead of trampling the soil down upon the roots, as is frequently done, make a bason round each plant, and pour in as much water as it will hold; repeat this some time afterwards, and then fill in the soil next day, or as soon as the ground is sufficiently dry. Where single plants are planted upon the lawn, the same treatment should, of course, be applied.

With regard to a selection of plants for the above purpose, the following may be noticed: Rhododendron maxi-

---

* Curtis's Guide Gen., 465.

* Indurated or coagulated albumen is said to consist in 100,000 parts of—

15,550	parts of nitrogen,
49,750	. . carbon,
7,775	. . hydrogen,
26,925	. . oxygen.
100,000	parts.

This analysis is not, however, quite correct; for we know that albumen produces, when decomposed, sulphuretted hydrogen, and by its leaving, after being burnt, a small residue of ashes, which contains chlorine, sulphur, phosphorus, soda, and lime.

mum, R. catawbiense, and R. pónticum. To these common kinds may be added some of the more beautiful hybrid varieties, such as R. altaclerense, R. Russellianum, &c. These —with some of the better kinds of Azaleas—might form the centre of the clump, round the edges of which might be planted the pretty dwarf Rhododendron ferrugíneum and hirsutum. There is another beautiful little plant called Daphne Cneorum which looks extremely well as an edging to an American clump, creeping along the ground, and producing masses of pretty pink flowers in the early part of summer. Then there are some of the hardy Heaths, such as Erica herbácea, which requires the same soil as American plants, and can be used for the same purpose as the last-mentioned. It flowers in winter and early spring, and has a very striking appearance at that time, when its pretty flesh-coloured blossoms are first seen peeping out from under their covering of snow. Menziésia polifólia, and the white variety (polifólia alba), have both pretty bell-shaped flowers, and answer well for planting in the front of Rhododendrons and plants of that kind. All these can easily be purchased at a reasonable rate in any nursery, and would add considerably to the interest and pleasure which the amateur feels in his garden.

Chrysánthemums ought now to be taken into the greenhouse or vinery without delay. No greenhouse plants in pots ought to be allowed to remain out any longer. The alterations recommended to be studied a few weeks since may soon be executed, and preparations may be made for that purpose.—*R. F.*

HOME CORRESPONDENCE.

Conical Boilers.—In your Paper of Oct. 1, I observe a paragraph signed Stephenson and Co., which contains the following statements:—That Messrs. Stephenson have for *many years* manufactured certain boilers, an improvement upon an invention of mine, under the name of Improved Conical Boilers; that they have advertised them in the *Gardeners' Chronicle* from its commencement; that I have seen and approved their improvement; and that Mr. Shewen has *lately* adopted for his boilers a form which is the *exact copy* of Messrs. Stephenson's. A note by the editor follows, stating that he has examined the boilers in question, and that those now erecting by Mr. Shewen at Chiswick do not appear to be different from Messrs. Stephenson's. With respect to Messrs. Stephenson's first statement, I can only remark that if it be correct, their improvement preceded my invention, as they are pleased to term it; for it is only six years ago that my first experimental boiler was manufactured by a respectable tradesman in Gracechurch-street, named Jarman, since dead. Their second assertion may be tested by every subscriber to the *Gardeners' Chronicle* who has preserved that work from its commencement, as I hope many have. The *Gardeners' Chronicle* commenced in January, 1841; the first advertisement of Messrs. Stephenson's which I can detect was in June, 1841, No. 24, p. 377, *b*; in this, there is no mention of conical boilers, improved or otherwise; the advertisement relates principally to iron fencing. In Aug. 28, No. 35, p. 562, appears another advertisement by the same parties, in which heating by hot water, on an improved principle, by Chanter's Patent Furnaces, is mentioned; but nothing of conical boilers. At length, in Oct., 1841, No. 41, we find "the much-approved Conical Boilers" mentioned for the first time, but nothing is said of any improvement in them. However, in the second year of the *Chronicle*, March 12, 1842, No. 11, *lately*, *i. e.*, about six months ago, appeared a paragraph in which Stephenson's Improved Conical Boilers were brought forward, which paragraph was followed by an advertisement in No. 12, March 19, 1842. In consequence of that advertisement, taking an interest in every improvement of my old hobby, I called at Messrs. Stephenson's a few days after. The Improved Conical Boiler which I then saw was a copper one, in general construction similar to those which Shewen had been manufacturing for upwards of nine months before. It had, however, one essential defect,—a defect which had been obviated in Shewen's boilers upwards of three years before,—viz., that the grate could not be cleared of clinkers without extinguishing the fire; a defect which rendered such boilers of very limited application. I have never seen one of Messrs. Stephenson's boilers since; but if the note by the editor of the *Gardeners' Chronicle* is correct, and Messrs. Stephenson's conical boiler, as at present manufactured, is *exactly similar* to Shewen's, Messrs. Stephenson have adopted my suggestion (which, however, they did not seem to appreciate); and so far from Shewen having copied theirs, they have *lately*, *i. e.*, within the last six months, copied Shewen's, and adopted from him a very important improvement, without which their boilers could not be made useful on a large scale. Shewen adopted the present form of his boilers fifteen months ago, in July, 1841, three months before the appearance of Messrs. Stephenson's first advertisement making mention of conical boilers, and nine months before the first notice of Messrs. Stephenson's Improved Conical Boilers—which *improved* conical boilers were at that time defective in a most essential point, (a defect remedied in Shewen's three years before,) and, unless altered at my suggestion, are defective still. It is perhaps hardly necessary for me to add, that Mr. Shewen informs me he has never seen one of Messrs. Stephenson's boilers.—*John Rogers.*

The Acacia or Locust-tree.—I have just read in your last Paper Mr. Billington's observations with regard to the Acacia or Locust-tree. That it will grow to a large size in this country, I know, as I have seen several fine timber-trees of that species in Gloucestershire. That it is very brittle, I can also answer for; and I much doubt if picking off or foreshortening the extreme ends of lateral branches would remedy that defect. Planting it in protected situations, such as the interior of other plantations, as mentioned by Mr. B., seems to me the only safe plan. Hares and rabbits eat it with avidity; but Mr. B.'s plan of smearing the plants yearly with his mixture, though I dare say successful for that period, would be a never-ending labour to any one planting on an extensive scale. I have planted and attended to plantations of several hundred acres on a sandy soil abounding with rabbits; and to prevent all the hard wood from being devoured by that vermin, I have freely used a mixture of gas-tar and oil, dabbed here and there upon the young trees, which did not wash off for two or three seasons, during which time the rabbits hardly touched them. It may be unsightly; but a planter would prefer to see the black which protected his trees, to the ominous white which, after a hard frost, shows him how many of his best trees had lived till then, but had at last fallen victims to the voracity of rabbits. I fear there is no remedy but the extirpation of the enemy: if any of your readers can suggest one, I for one should feel most grateful. I have my doubts that what I have mentioned as my protection may be far from beneficial to the young trees; but they have survived it, and therefore it is the least of two evils—the choice being between injury and certain death. In the plantations I have alluded to, the bark of the Oaks in a few years grew too coarse and less toothsome to the rabbits; but Ash, Spanish Chesnut, and Beech, never seem to outgrow their voracious partiality. If deer and cattle prefer to eat trees in the spring and summer, the winter is the season for hares and rabbits to feast upon the remainder. The opinions upon pruning or not pruning are so numerous, and the circumstances calling for or forbidding it so varied, that private judgment seems left to act according to its own short experience. The late Lord Leicester having lived to see the trees he planted sixty years old, having attended to them from the time the young plants were put into the ground till he cut them down timber-trees, his experience and opinions would be of great value. If he has left no record of them, an account from his forester of the general management of his woods would be desirable. With regard to the suggestion of forming an arboricultural society, might not the same end be obtained if, in the department of our Woods and Forests, orders were given that different plans of planting and culture should be tried, and records kept of the advantage or failure of the different experiments?—*Sherwood.*

Effects of Salt upon Celery.—Some time ago you pointed out the beneficial effects of salt in growing Asparagus. There is another plant cultivated in gardens which would be greatly benefited if a little more salt was added to its food, for I believe the manure which it commonly receives is as wairsh to its taste, as brose without salt to a Scotchman. Celery is the plant I mean; I recollect gathering it in a wild state, some years ago, on the north side of the Firth of Forth, in situations that would be watered by spring tides; and I believe that it is commonly found, both in England and Scotland, in ditches near the sea. This season I gave a considerable quantity of salt to a row of Celery, by putting it between the plants some time after they were planted; I then watered them freely, which carried the saline particles down to the roots. This appears to have done the plants much good, for they grew remarkably well afterwards. From the Report on Covent Garden Market, some time ago, it appears that Celery this season, in the neighbourhood of London, has been rather shorter than usual. Some of my plants, to which salt was applied, measured, by the middle of September, four feet in height, thirty inches of which were well blanched.—*Peter Mackenzie.*

Potatoes and Guano.—As I think I have observed a desire expressed in the *Chronicle*, to be put in possession of facts connected with the effect of Guano as a manure, I forward you the accompanying box, containing three samples of Potatoes, called, in this part of the country, "Pink-eye Kemps." Each sample affords a fair average specimen of the lot from which it has been taken, after rejecting the very small ones unfit for use. They have been grown in a field of excellent light soil (broken up now for the first time during 20 years), in short broad butts, containing five rows in each, prepared by the spade. The sample No. 1, grown with the aid of common stable manure, was taken from one butt of several similarly prepared, and producing a like result. They each yielded about four pecks. Round each "set" of No. 2, I distributed about a tablespoonful of Guano, in addition to the stable manure. In No. 3, the "sets" were surrounded by two tablespoonfuls of Guano, and nothing else. In both these cases, the produce from the same number of sets as the first was equal to five pecks. The Potatoes grown with Guano are very much larger than those with stable dung only, and those aided by Guano alone are more *evenly* large than those by Guano and dung together. The most remarkable effect produced, was on the colour of the foliage while growing, which is naturally, in the case of this Potato, of a pale yellow green. Those that had Guano alone applied to them, were as dark as Strawberry plants. The Guano mixed with the manure had not so much effect on the colour of the foliage, as on the strength and height of the stems. I fear this experiment is not of great practical value, as the quantity of Guano used was much larger than could be afforded in general cultivation.—*G. L., Pex Hill, Warrington.*—[Upon examining the Potatoes referred to in this communication, we find them all of excellent quality; but those manured with Guano alone are much finer than those of Nos. 1 and 2, between which we see no difference.]

Nitrate of Potash as a Manure.—Since Nitrate of Soda is so much adulterated, would not Nitrate of Potash, which is generally to be had much more pure, and which costs but a few shillings per cwt. more than the other, be preferable, and perhaps cheaper in the end? I have good reason for believing it a more powerful stimulant to vegetation.—*Lusor.*

To preserve Carrots.—A correspondent in a late Number of the *Chronicle* inquired respecting the best mode of preserving Carrots during the winter. The following method I have found to answer admirably:—I choose a sunny day in October for taking up the roots, which I allow to remain in the open air till the evening, when I house them in some dry shed or stable for three or four days, leaving the green heads attached. Previously to packing them, I cut the tops off within half-an-inch of the crown, and place the roots either in a manger, hamper, or box, with alternate layers of sand. In this way, they keep sound and good for many months. Care must be taken to separate the bruised Carrots from those which are perfect, and the sand cannot be too dry.—*W. W.*

To preserve Walnuts.—To do this effectually, so that they neither shrivel, become mouldy, nor lose their flavour, requires much care and attention. They should be allowed to hang upon the tree until the outer covering begins to crack; in this state, when the tree is thrashed, many of the Walnuts, as they fall, will roll out of the husk. These should be gathered into a basket, separate from those that retain their covering; the latter should be laid aside for a few days, until the husk bursts and they can be taken out with care. The great object, in the first place, is to prevent their becoming mouldy; they should, therefore, be wiped clean and dry, and laid on a shelf in a situation where they can have a free current of air, until all tendency to mouldiness is overcome. Great care must be taken that they are not over-dried, as that will cause shrivelling: this can easily be ascertained by opening some of them occasionally. When sufficiently dry, they should be put in boxes, in layers, alternately with bran or shreds of cloth, and kept for use in a cool and dry situation. If the above is carefully attended to, they will retain their moisture and flavour, and the film will with ease peel off.—*James Falconer, Cheam.*——I have practised the following plan with success, and by this mode of treatment I have always found them to retain their flavour, without any signs of shrivelling or mouldiness. As soon as the husks begin to crack I have them beaten from the trees, after which they are laid in a heap in an open shed, in which state they will acquire a gentle heat, which will cause the whole of the green part to leave the nuts freely. The latter must then be separated from the heap as quickly as possible, otherwise the decay of the green part will turn the nuts black. After being thoroughly cleaned let them be spread out again in a similar situation till they are perfectly dry; which is essential to prevent mouldiness, as sufficient moisture is sure to rise from them when put away, notwithstanding the precaution previously taken to dry them. When prepared in this manner some boxes or old packing-cases must be provided, with a sufficient quantity of dry saw-dust (avoiding that of yellow deal, which will give an unpleasant taste to the kernel), and the Walnuts may be packed in the boxes, placing a layer of saw-dust and one of nuts alternately, till the box is full, allowing only one nut in thickness in each layer. The saw-dust must be well worked among them, and the whole should be finished with a good covering of the same material. It will be necessary to examine them frequently, for after all the precaution taken to dry them previously to packing them up, they are liable to become heated; in which case it will be requisite to remove a part, or all of them, till they become cool again. This will soon take place, and the Walnuts may then be returned to the boxes in the same manner as before. This attention may appear troublesome, but I have invariably found it repay me for all the pains I have taken, as I have kept them until May with the flavour unimpaired, the kernel plump, and the skin peeling from it as freely as it did the first day after they left the trees. I have always found that those Nuts which are left upon the trees until quite ripe, keep a much shorter time than others collected in the state recommended above, as they soon begin to grow and turn bitter. A close room or cellar (not too damp or cool) is the best situation for the boxes. When they are wanted for use, a dish of them may, with a soft brush and cloth, be prepared for table in a few minutes, without any of that grittiness, from which it is impossible to free them when preserved in sand.—*Charles.*——By the following method I have had Walnuts, not only as fresh in appearance, but in every way as plump and well-flavoured in March, as if just taken from the tree. As soon as cleaned from the husks, they were put loosely into glazed earthen-ware jars to within three inches of the top; the remainder of the jar being filled up with fine dry sand, well shaken down, that it may find its way to the bottom, and fill up the vacant spaces. A cool cellar is the best place to keep them in till wanted. In return I should be greatly obliged to some of your correspondents for a hint on Filbert-keeping. Some one has already asked a similar question, but I have not seen any satisfactory answer to it. Mine either come all out of the husks, and of course look no better than Barcelonas, or else get white with mould; in either case they are unfit for the table. I have tried various plans to preserve them with that peculiar brown sunny appearance which we see them have in Covent-garden, but hitherto without success.—*S. B.*

Roasted Apples.—If there be reason in the roasting of eggs, you may, perhaps, think it both reasonable and seasonable to say a few words to the numerous readers of the *Chronicle* on the subject of Apples. The late Mr. Walker, in his "Original," recommends that the core be removed to within half an inch of the bottom, and the space occupied with a piece of butter and some sugar, according to the quality of the fruit; if to this some fine rind of lemon be added, perfection will be attained.—*Pomo.*

The Sweeney Nonpareil.—This Apple is beautifully coloured this season. On a south wall I have measured one eleven inches in circumference; and I gathered a small one quite ripe, which was of excellent quality and very sweet. I also gathered one from a standard, which was of the richest colour, but quite hard and acid—showing that the variety requires a better climate. The crop is superior to any other, and I dare say that I have a waggon-load or two of these Apples.—*T. N. P.*

Cultivation of the Strawberry.—On the piece of ground intended for planting I spread a layer of *long* stable dung, a foot thick. I trench the ground 3 feet deep, putting the manure at the bottom of the trench. *Long* dung is then spread on the surface of the trenched ground, to the depth of 6 inches, and afterwards dug in. Beds four feet wide are marked out, with a foot alley between each—which is highly necessary, to prevent those who gather the fruit from treading between the plants; and, lastly, the runners are planted 2 feet apart. A bed thus made will last three years without requiring anything further, not even so much as a top-dressing; but the runners should be removed, and the beds kept free from weeds. As I make my plantations from July to October, the plants come into full bearing the following spring. Strawberries planted upon ground thus prepared do not require to be watered even in the hottest weather, because of the depth to which the roots will penetrate. I find that strong-growing kinds, such as the British Queen, require a more loamy soil than others. If the planting is deferred until spring, the crop will not be half so large.—*Fragaria.*

To destroy large Moths.—I beg leave to suggest the following plan for destroying quickly the largest butterflies and moths, having used it for the last ten years without once failing in its purpose. It is with arseniacal soap. The quantity I first purchased was about eighteen-pennyworth, which has lasted for ten years, and I have sufficient for five or six years more. The soap is slightly wetted, and mixed into a lather or paste with the end of the pin which you intend to insert into the insect. The quantity which adheres to the pin will be quite sufficient to kill the largest of them. This substance, being poisonous, should be kept in a secure place.—*James Linton, Rusholme, Manchester.*

The Sting of a Wasp.—Amongst the many remedial applications for the sting of wasps, &c. (all of which I have tried), I have not found any to equal the remedy afforded by applying a mixture of salt and vinegar to the part affected.—*G. Wolsey.*

To destroy Fleas.—Withering says the leaves of the common Alder (Alnus glutinosa) are sometimes strewed upon floors to destroy fleas, and that the branches of the Sweet Gale (Mýrica Gale) will produce the same effect.—*Lusor.*

Vines.—Last year, in my vinery, one tree was more productive than the others, and the fruit from it was delicious, large, and abundant. This year the crop is equally great, but one-half is perfectly *worthless*, while the other half is in every way valuable. The fruit is there, but the difference in it is striking—the one part is plump and good, whilst the other is without size, colour, or flavour. Previously to ripening, small dark spots appeared on the berries and surrounding branches of the injured clusters: these went on increasing until all the fruit became stained and of a brownish colour, although the vine in other respects seemed in excellent health. I would feel favoured by your drawing the attention of your correspondents to the matter; and if a similar case has ever been before you, by letting me know the probable causes which induced it, as well as the treatment which you would recommend to prevent a recurrence of similar effects next year. That part of the Vine which is most injured ranges along the top of the house.—*A Subscriber, Dublin.*—[Will any of our correspondents kindly assist us in solving this problem?]

Vallisnéria Spiralis.—I perceive from your pages that the Dionæa muscípula has survived a Cornish winter in the open ground, covered with a bell glass. Mr. Campbell, the eminent curator of the Botanic Gardens at Manchester, pointed out to me the other day a very healthy plant of the Vallisnéria spiralis, growing in an open pond without any protection; it had survived the winter's frost beneath the covering of ice.—*J. Murray.*

Heat of the Summer.—As a proof of the extraordinary heat of the summer, I send you some seeds of the Palma Christi, which ripened in the open garden. The plants were raised in a greenhouse in May, and in July were planted out in the open border, when about 18 inches high. The plant from which these seeds were gathered is still out, and is now about five feet high.—*J. How, Stroud Green.* [It is certainly a long time since the Palma Christi has ripened seeds in England. But it used to do so in most years.]

To make Annuals Bloom late in the Autumn.—Having seen in late numbers of the *Chronicle* that attempts have been made to obtain flowering plants in the autumn, I beg to state that many of our most beautiful annuals may be prolonged for a considerable period after their time of flowering, by cutting them back immediately after the bloom begins to decay. I have this season practised it upon a bed of Ery'simum Perofskianum, Lasthénia califórnica, and some Mignonette. I am also informed by a friend of mine that he has tried it successfully upon a border of Ten-week Stocks. Should this meet the eye of any of your correspondents who have made this experiment with other plants, they will confer much benefit on your readers by making known the result. I have no doubt but many other kinds may be treated successfully in the same manner.—*G. Fielder, Gardener, Wadhurst Castle.*

FOREIGN CORRESPONDENCE.

Paris, September 1842.—"Cercle des Conférences Horticoles du Département de la Seine."—This is a new Horticultural Society, established within the last year by the Nurserymen and Florists of Paris, and at present, I believe, almost entirely confined to their own body. It does not, however, exclude others, and will no doubt soon number among its members many of the principal Amateurs of the neighbourhood. Its President is Monsieur Bréon, a very respectable nursery and seedsman, who formerly held the office of Government Botanist in the Ile de Bourbon, and to whom we are indebted for the introduction of "Rosa Borboniana," and its now splendid varieties. Unlike its more exalted companion—the Royal Society—it seeks no patronage from the state, but hopes by its own merits to win public favour; it starts upon the maxim "Be just and fear not," and certainly its first public exhibition, which was holden at the Orangerie of the Tuileries from the 20th to 24th of this month, argues well for its impartiality and future prospects. The weather for the last four months has been anything but favourable for floral exhibitions; therefore, the plants were neither so numerous nor fine as could have been desired. Nevertheless, I saw fine specimens of Strelítzia augusta and reginæ, Oncídium flexuosum, Coccoloba pubescens, Euphórbia neriifólia, Cycas revoluta, Asclépias curassávica alba, Yucca Draconis, Gongora atropurpúrea, and Nymphæa cærúlea, from M. L'Homme; Amaranthus giganteus (12 feet high), Allamanda cathártica, Musa Cavendishii, in fine fruit, from M. Jacques; Cattleya Pinélii with its splendid pale rose and bright crimson flowers, Gesnera zebrina, Hibiscus Cameroni, Sophronitis grandiflora, Thunbérgia Baxtérii, by M. Thibaut; Russélia júncea, Bouvárdia splendens, Céreus senilis, from MM. Jacquin; several large plants of Brunsvigia Josephinæ, multiflora and falcata, and Abies religiosa, by M. Bréon; Æschynanthus grandiflorus, Angelónia speciosa, Gloxínia hirsuta, Geissoméria longiflora, Achimenes longiflora, and Abútilon Bedfordianum, by M. Chauvière; Rondelétia speciosa, Leschenaúltia formosa, Crówea saligna, and Erica cruenta, Linnæana superba, mammosa coccínea, cerinthoides major, pyrolæflora, and ventricosa porcellana, from M. Martin; Daubentónia Tripetiana, Achimenes longiflora, Lophospermum Hendersoni, and Poinciana Gilliesii, by M. Tripet Leblanc; Crinum amábile, Dracæna Draco, Astrapæa Wallíchii, and Amaryllis reginæ, by M. Picot; Nymphæa cærúlea, Guzmannia trícolor and Cypripédium insigne, by M. Loth; Bignónia jasminiflora, in fine flower, by M. Modeste Guérin; also a splendid large branch of Támarix orientalis, twelve feet high, literally covered with delicate pink flowers; and a plant of Fráxinus laciniata, grafted in May, which had made a shoot at least ten feet long. The Nériums of M. Mabire were, as usual, remarkably fine. China Roses were in great abundance, there being no less than ten exhibitors of them as cut flowers, or plants in pots. In spite of the untoward season, many were in all their beauty, especially the Bourbons, which, together with the Hybride remontantes, are the reigning favourites; certainly their large finely-formed flowers and handsome glossy foliage eminently entitle them to this distinction. The collections of MM. Verdier, Paillet, and Levêque were the most worthy of praise, and contained, among others, well-grown specimens of the Devoniensis, Bougère, Goubault, Mansais, Triomphe de la Guillotière, Elise Sauvage, Triomphe du Luxembourg, Princesse Hélène, Caroline, Duchesse d'Orléans, Ile de Bourbon, Pacquin, Chatenet, Reine des Bourbons, Docteur Roques, Triomphe de Plantier, Bréon, Paul Joseph (a fine new variety of a very dark purplish crimson, by M. Levêque, Boulevard de l'Hôpital), Victoire Paumy, Prince Charles, Comices de Seine et Marne (this is the splendid crimson seedling raised by M. Desprez, and fully supports the description I gave last year); Emilie Courtier, Pucelle génevoise, and Fabert; Hybrids, Comte de Paris, Clémentine Duval, Rivers, Belle Sara, Prince Albert, Duc d'Aumale, Prudence, &c. &c. The Dahlias were neither numerous nor fine; indeed one-half of the plants round Paris have given no blooms; and as to those which have, the red spider and earwigs have held mastery so complete over both leaves and flowers, that a fine show was all but impossible. Had this, however, not been the case, the stands would (to English eyes) have been so disfigured with tipped varieties as scarcely to deserve attention. M. Soutif had some large blooms of Reine des Fées, Pygmalion, Reine d'Or, Caroline Walner, Modesta, Purpúrea alba, Beauté de Paris, Prince Albert, President of the West, Poole's White, Lady Cooper, Charles XII., Constantia, Comte de Cussy, Roullard, Triomphe de Tours, Andrew Marvel, Maid of Bath, Rival Revenge, and Winterton Rival. Some few Seedlings were also exhibited, but none above mediocrity. I now come to the Fruit, which has this summer flourished under the influence of all but a Persian sun. The Grapes and Pears, of an unusually large size, were the admiration of all; in fact, the sight was provokingly tantalising to those who had not the means of indulging in these bounties of nature, and almost too much even for the regular *gourmands* of Paris. The Chasselas de Fontainebleau possessed that beautiful transparency and golden colour seldom seen elsewhere than on the Continent, and for which they are so celebrated. Besides these, were the Chasselas violet; Madeleine blanche, very large; Grommier du Cantal, large violet-purple; Frankenthal (Black Hamburgh), fine, but not equal to those exhibited at Chiswick; Gros Ribier de Maroc, large white; Gros Damas blanc, large; Bourdalès, large white; Cornichon blanc, having large and curiously-formed berries; with enormous bunches of Raisins de la Palestine. Mr. Flantin exhibited several very fine large Aubergines (Solanum melongena), both long and round varieties with red and yellow fruit. The Pears and Apples by M. Jamin were all that could be desired: the following kinds were, however, from their large size most conspicuous:—*Pears*—Catillac, Van Mons Léon Leclerc, Beurré d'Angleterre, B. d'hiver, Incomparable, Passe Colmar, Bonchrétien d'hiver, Calebasse, Doyenné d'hiver, Doré, Bergamotte de Pentecôte, Royale d'hiver, Beurré Chaumontel, Bezy de la Motte, Duchesse d'Angoulême, Colmar d'hiver, Belle Angevine, Beurré d'Aremberg, St. Germain. *Apples*—Calville blanc, Reinette de Canada (of an enormous size), Géante de Suisse (very large), Alexander, Calville rouge, Reinette de Hollande, and Belle Josephine.

PROCEEDINGS OF SOCIETIES.

BOTANICAL SOCIETY OF LONDON.

Oct. 7.—A. Gerard, Esq., in the chair. Donations to the library were announced from G. W. Francis, Esq. British plants were received from the Rev. A. Bloxham, Dr. Bossey, Messrs. Fordham, Doubleday, Holman, Bidwell, &c. Mr. J. Thompson exhibited specimens of Carex irrígua, Sm., collected by him at Muckle Moss, near Thorngrafton, Northumberland. Mr. D. Stock presented the following monstrosities: Scolopéndrium vulgare, bearing two fronds, the one barren and reniform, the other bearing sori, and elongated, with the midrib spirally twisted; Aspídium lobatum, having the rachis of the fronds much abbreviated and slightly recurved, pinnæ numerous and overlapping; two abortive specimens of a Rose, producing perfectly-formed and leafy branches from the axis of the flowers. Mr. Stock also presented specimens of Thelephora caryophýllea (new to Great Britain), discovered by him in August 1841, in a plantation at Bungay, Suffolk. Mr. T. Twining, Jun., presented a large collection of living plants for distribution, cultivated in his garden at Twickenham. The conclusion of a paper from Mr. R. S. Hill, being "An Inquiry into Vegetable Morphology," was read, after which the meeting adjourned.

COUNTRY SHOWS.

Bath Royal United Horticultural Society, Sept. 15.—This exhibition took place in the Gardens of the Victoria Park. The following is a list of the prizes:—Seedling Dahlia: 3 *blooms*, Mr. Wheeler, a piece of plate of the value of 2*l*. Florists' Flowers and Cut Flowers. Class 1, Nurserymen—Dahlias, *collection of* 24, 1, Mr. Wheeler; 2, Mr. W. Maule; 3, Mr. Walters. *Collection of* 18, 1, Mr. Walters; 2, Mr. Wheeler; 3, Mr. Sealey. German Asters—*collection of* 12, Mr. Wheeler. Class 2, Amateurs—Dahlias, *collection of* 18, 1, J. M. Yeeles, Esq.; 2, T. Emmerson, Esq.; 3, Mr. G. D. Fisher, with Maria, America, President of the West, Indispensable, Bedford Rival, Andrew Hofer, Brown's Metella, Maid of Bath, Fanny Keynes, Rouge et Noire, Lewisham Rival, Grande Baudine, Ansell's Unique, Pickwick, Bridesmaid, Widnall's Queen, Dodd's Prince of Wales, Phenomenon. *Collection of* 12, 1, J. M. Yeeles, Esq.; 2, Mr. Sainsbury; 3, T. Emmerson, Esq. *Collection of* 6, 1, Mr. Salter; 2, T. Emmerson, Esq. German Asters—*Collection of* 12, 1, Mr. C. Sainsbury; 2, Mr. Reed. Ornamental Collection of Cut Flowers, 1, Mr. G. Shaw; 2, Rev. J. Bond. Roses—*Best collection*, Messrs. Salter and Wheeler,—Bourbon, Noisette, Tea-scented, Perpetual, and Hybrid China Roses; 2, Mr. Bennett. Flowering Plants in Pots. Class 1, Nurserymen—Stove Plants, *collection of* 3, Mr. Drummond. Greenhouse Plants, *collection of* 8, 1, Messrs. Salter and Wheeler; 2, Mr. Drummond. Fu'chsias, *collection of* 12, Messrs. Salter and Wheeler. Balsams, Messrs. Salter and Wheeler. Calceola'rias, *collection of* 12, Messrs. Salter and Wheeler,—rubra, formosa, Champion of the West, Mary, variábilis, punctata, viscosissima superba, Sarah, Prince Albert, corymbosa, Bronze, Mrs. Gen. Andrews. Ornamental Basket of Plants, 1, Messrs. Salter and Wheeler, 2, Mr. Drummond. Class 2, Amateurs—Orchidaceous Plants, *collection of* 3, 1, J. Jarrett, Esq.,—Oncídium papílio, Gongora maculata, Stanhópea grandiflora; 2, J. Jarrett, Esq.,—Oncídium papílio, Gongora maculata, Epidendrum cochleatum. Stove Plants, *collection of* 3, 1, J. Jarrett, Esq.,—Clerodendrum paniculatum, Clerodendrum squamatum, Allamanda cathártica; 2, J. Jarrett, Esq.,—Clerodendrum squamatum, Angelónia Gardneriana, Ceropégia stapeliæformis. Greenhouse Plants, *single specimen*, 1, J. M. Yeeles, Esq.; 2, J. Jarrett, Esq.—Witsénia corymbosa. Cockscombs, J. Wiltshire, Esq. Balsams, J. M. Yeeles, Esq. Amaryllis, W. Miles, Esq. Ornamental Basket of Plants, 1, J. M. Yeeles, Esq.; 2, Mr. G. Shaw. Fruit—Pineapples, 1 and 2, Mr. Hatch, gr. to P. J. Miles, Esq. Grapes—*Black*, 1, G. C. Tugwell, Esq.; 2, W. Miles, Esq., M.P. *White*, 1, Mr. Pyatt; 2, Mr. G. Shaw. *Best bunch of any sort*, Mr. Shaw. Melons, 1, G. C. Tugwell, Esq.; 2 and 3, Mr. Murray, gr. to the Marquess of Bath. Peaches, 1, J. Wiltshire, Esq.; 2, Mr. Hamlet. Nectarines, 1, T. M. Cruttwell, Esq.; 2, W. Miles, Esq. Figs, Mr. Salter. Plums, 1, Mr. Kitley; 2, W. Miles, Esq. Greengages, 1, B. Smith, Esq.; 2, Mr. Sturmy. Pears, 1, Mr. Kitley; 2, Mr. Cole. Cherries, 1, B. Smith, Esq.; 2, Mr. Salter. Mulberries, W. Miles, Esq. Apples, *Dessert*, 1, Mr. W. Salter; 2, W. Miles, Esq.; 3, Mr. Sparkes. *Culinary*, 1, Mr. Minty; 2, J. M. Yeeles Esq. Filberts, 1, J. Wiltshire, Esq.; 2, Mr. Alexander. Nuts, Mr. Pyatt. Vegetables—Best Collection of Cauliflowers, Tomatoes, Celery, Endive, and Shallots, 1, Mr. Cooper; 2, Mr. Lidiard; 3, Mr. J. Cooke. Best Collection of Broccoli, Carrots, Onions, Capsicums, and Beet, 1, Mr. J. Cooke; 2, Mr. Lidiard; 3, Mr. Cooper. Best Salad, 1, Mr. Cooper; 2, Mr. J. Cooke. Paintings—Best Group, *Original*, Miss F. Rosenberg. Extra Prizes, *Dahlia*, Mr. Walters. *Seedling Dahlia*, Mr. Drummond. *Dahlia*, Mr. Gready. *Device in Flowers*, W. Bush, Esq. *Box of Cut Flowers*, R. Godfrey, Esq. *Stove plant*, Messrs Salter and Wheeler. *Orchidaceous Plant*, J. M. Yeeles, Esq. *Onions*, Mr. Lidiard. *Apples*, John Day. Numerous cottagers also received prizes for their productions.—*Bath and Cheltenham Gazette.*

Brighton Horticultural Society, Sept. 28th.—The following is a list of the prizes:—Dahlias, Mr. Parsons, Mr. Kidd, Mr. Hobden, Mr. E. Mitchell, and Mr. Watkins. Collection of Dahlias, Mr. Kidd and Mr. Hobden. Greenhouse Plants, Mr. Hobden and Mr. Randall. Flowers of Herbaceous Plants, Mr. B——, Mr. Hobden and Mr. Randall. Pansies, Mr. E. Mitchell, Mr. Parsons and Mr. Willmer. China Asters, Mr. Watkins and Mr. B——. French Marygolds, Mr. B—— and Mr. Walters. Indian African Marygolds, Mr. Hobden and Mr. Walters. Pinks, Mr. E. Mitchell. Annuals, Mr. Walters, Mr. Hobden, and Mr. B——. Bouquet, Mr. Hobden and Mr. E. Mitchell. Cucumbers, Mr. Walters and Mr. Kidd. Vegetables, Mr. Walters, Mr. E. Mitchell, Mr. Peskett, Mr. Gorringe, and Mr. Hardwick. Grapes, Mr. E. Mitchell and Mr. Kidd. Melon, Mr. Kidd. Dessert Pears, Mr. Peskett. Culinary Pears, Mr. Kidd and Mr. B——. Dessert Apples, Mr. Kidd and Mr. Rogers. Culinary Apples, Mr. B—— and Mr. Hardwick. Sweepstakes for Dahlias, 1, Mr. Bragg, with Jones's Frances, Burnham Hero, Bridesmaid, Duchess of Richmond, Springfield Rival, Unique, Bedford Surprise, Phenomenon, Widnall's Queen, Grande Baudine, Hudson's Princess Royal, and Catleugh's Eclipse; 2, Mr. Gaines, with Gaines' Emperor, Bridesmaid, Prince Albert, Lady Palmer, Dodd's Prince of Wales, Bloomsbury, Springfield Purple, Beauty of Wandsworth, Pickwick, Waterford Surprise, Array, and Eclipse; 3, Mr. Bursill, with Grand Tournament, Widnall's Queen, Burnham Hero, Metella, Langley's Enterprise, Springfield Rival, Nicholas Nickleby, Catleugh's

Eclipse, Dodd's Queen of Sarum, Hudson's Princess Royal, Dodd's Prince of Wales, and Phenomenon.

Devon and Exeter Horticultural Society, Sept. 22.—This exhibition was held in the Higher Market-house. The following is a list of the prizes:—Fruit—Pine-apple, (*a silver medal,*) C. Hoare, Esq.; 2, Mrs. Wells. Dish of White Grapes, 1, T. Porter, Esq.; 2, J. W. Buller, Esq. *Black*, 1, Sir J. Kennaway; 2, Mrs. Granger. Mixed Grapes of various sorts, 1, J. W. Buller, Esq.; 2, Sir J. Kennaway. Melon, 1, W. Hooper, Esq.; 2, Rev. W. H. Arundell. Peaches, H. Porter, Esq. Nectarines, F. Cross, Esq. Plums, *Purple*, F. Cross, Esq.; *Light-coloured*, F. Cross, Esq. Morello Cherries, Mrs. Wyatt. Figs, Sir J. Kennaway. Red Currants, H. Porter, Esq.; *White*, Sir T. D. Acland. Raspberries, J. W. Buller, Esq. Dessert Pears, R. T. Head, Esq. *Collection of ditto*, T. Porter, Esq. *Collection*, 6 *sorts*, Sir J. Kennaway. Collection of Dessert Apples, 1, R. T. Head, Esq.; 2, C. Shireff, Esq. Cooking Apples, T. Porter, Esq.; 2, E. Lousada, Esq. Nuts, A. Z. Extra Fruit—*Pears*, J. W. Buller, Esq. *Apples*, W. Buller, Esq. *Cornish Gilliflower*, Sir T. D. Acland. *Black Hamburgh Grapes*, 1, E. Lousada, Esq.; 2, T. Porter, Esq. *Black out-door Grapes*, Mr. Gray. *Melons*, Rev. T. Dornford. *Damsons*, J. W. Buller, Esq. *Box and 2 glasses of Honey*, C. Shireff, Esq. *Otaheite Pine*, C. Hoare, Esq. *Oranges*, Mrs. Wells. *Lemons*, Mrs. Wells. Vegetables—Celery, T. Porter, Esq. Carrots, Mrs. Granger. Parsneps, Sir T. D. Acland. Red Beet, J. Milford, Esq. Broccoli, Sir T. D. Acland. Cos Lettuce, J. W. Buller, Esq. Cabbage ditto, Mrs. Granger. Endive, T. Porter, Esq. Peas, Sir J. Kennaway. Broad Beans, J. W. Buller, Esq. Kidney Beans, T. Porter, Esq. Dwarf Kidney Beans, Sir J. Kennaway. Artichokes, Sir T. D. Acland. Tomatoes, J. Huxham, Esq. Seedling Potatoes, 1, J. W. Buller, Esq.; 2, W. Kingdon, Esq. Best Collection of Vegetables, Sir J. Kennaway. Extra Vegetables—*Collection of Seedling Potatoes*, D. 22. *Brace of Cucumbers*, T. Porter, Esq. *Capsicums*, W. Hooper, Esq. *Vegetable Marrow*, W. Hooper, Esq. *Onions*, H. Porter, Esq. *Potatoes*, Sir T. D. Acland. Flowers and Plants—Orchidáceæ, *six best specimens*, 1, Mrs. Wells; 2, J. W. Buller, Esq. *Newest and best specimen*, Sir T. D. Acland. Stove Plants, *best* 6—1, Mrs. Wells; 2, J. W. Buller, Esq. *Single specimen*, Mrs. Wells. Greenhouse Plants, *best group of* 12, (*silver medal,*) Mrs. Wells; 2, J. W. Buller, Esq. Cape Heaths, 1, Mrs. Wells; 2, H. Porter, Esq. Herbaceous Plants, 1, Sir T. D. Acland; 2, H. Porter, Esq. Collection of Roses, H. Porter, Esq. German Asters, F. Cross, Esq. Hardy Annuals, 1, H. Porter, Esq.; 2, J. Milford, Esq. Cockscombs, Mrs. Mitchell. Dahlias, *best* 24, (*a silver medal,*) F. Cross, Esq.; 2, Mr. J. Griffin, gr. to Mrs. Wells; *best* 18, 1, H. Porter, Esq.; 2, Mrs. Wells: *best* 12, 1, F. Cross, Esq.; 2, Mr. J. Clarke: *best* 6, F. Cross, Esq. *Seedling*, (*a silver medal,*) W. R. Whale, Elcot. Extra Flowers and Plants—*Collection of Dahlias*, F. Cross, Esq. *Bulbs*, J. W. Buller, Esq. *Achimenes longiflora*, Mrs. Wells. *Burlingtónia Reginæ*, Mrs. Wells. *Collection of Stove plants*, Mrs. Wells. *Greenhouse plants*, Mrs. Wells. Numerous Cottagers' Prizes were also given.—*Plymouth Gazette.*

Durham Horticultural Society, Sept. 28.—The third Exhibtion was held at the Exhibition Rooms, Saddler-street, when the following prizes were awarded:—Flowers—Nurserymen, Dahlias, 50 *blooms*, Mr. J. Harrison. *Best* 36, Mr. H. Newton. *Best* 24, Mr. J. Harrison. *Best tipped Dahlia*, Mr. J. Harrison. *Best self-coloured*, Mr. H. Newton. Amateurs and Gardeners—Premium Prize of 1*l.* 1*s.*, *added to a sweepstakes of 2s. 6d. each competitor, for the best* 24 *Dahlias*, H. J. Marshall, Esq. *Best* 18, Mr. P. Caldcleugh. *Best* 12, Mr. F. Nichol, gr. to H. J. Spearman, Esq. *Best* 6, Mr. P. Caldcleugh. *Best* 3, Mr. P. Caldcleugh. *Best self-coloured Dahlia*, H. J. Marshall, Esq. *Best tipped*, H. J. Marshall, Esq. *Best Seedling*, Mr. Dewer, gr. to W. Cuthbertson, Esq. Pansies, Mr. H. B. Hall. *Seedlings*, Mr. F. Nichol. Exotic, Mr. F. Nichol. Stocks, Mr. Daglish, gr. to T. Fenwick, Esq. Cockscomb, Mr. F. Nichol. Bouquet of Flowers, Mr. W. Thompson, jun., gr. to W. Green, Esq. Bouquet of Dahlias, Mr. W. Thompson, jun. Fuchsia, Mr. F. Nichol. Collection of Greenhouse Plants, Mr. G. Lowery, gr. to Mrs. Fawcett. Prize of half-a-guinea, *given by H. J. Marshall, Esq., to Amateurs, for the best blooms of the following Dahlias*—Phenomenon, Duchess of Richmond, Lee's Bloomsbury, Pickwick, Cox's Defiance, and Lady Middleton, to Mr. P. Caldcleugh. Prize of 1*l.* 1*s.*, *given by Mr. J. Harrison, for the best* 6, *blooms of new varieties* - Dodd's Prince of Wales, Lady Harland, Admiral Stopford, Hudson's Princess Royal, Northern Beauty, and Attila, to H. J. Marshall, Esq. Fruits—Pine-apple, Mr. Dale, gr. to W. Russell, Esq. Grapes, Mr. Dale. Melon, Mr. Hutton, gr. to G. Salvin, Esq. Peaches, Mr. J. Simm, jun., gr. to W. T. Greenwell, Esq. Nectarines, Mr. J. Thompson. Apricots, H. Taylor, Esq. Plums, Mr. Sanderson, gr. to R. E. D. Shafto, Esq. Pears, Mr. J. Thompson. Apples, Mr. Baxter, gr. to Sir R. J. Eden, Bart. *Kitchen*, Mr. Hutton. Morello Cherries, Mr. Dale. Vegetables—Celery, Mr. F. Nichol. Onions, Mr. J. Hall. Carrots, Mr. F. Nichol. Cucumber, H. Taylor, Esq. Cauliflowers, Mr. R. Dodds, gr. to Rev. G. Townsend. Red Beet, Mr. F. Nichol. Parsneps, Mr. F. Nichol.—Extra Prizes. Mr. G. Hindmarsh, gr. to W. L. Wharton, Esq., for *Hollyhocks and Red Currants*. Mr. J. Simm, jun., for *Gooseberries*. Mr. Dale, for *large stewing Pears*. E. Tyler, Esq., for *Pumpkins*. Mr. Douthwaite, for *Hoya carnosa*. Mr. F. Nichol, for a *collection of Fuchsias*. Mr. J. Hall, for *Red Cabbage*. Messrs. Hedley, *for 12 Seedling Dahlias*.

Everton and Kirkdale Floral and Horticultural Society, Aug. 11. This exhibition took place in the pleasure-grounds behind Mr. New's hotel, at Kirkdale. The following is a list of the prizes:—Carnations: *Premier*, 1, Mr. W. Evans, Game Boy, Beauty of Warley, Cestrian, William the Conqueror, Marchioness of Westminster, Princess Charlotte, Willmer's William the Fourth; 2, Mr. J. Soorn, Nonpareil, Nulli secundus, Lowe's Marchioness, Game Boy, Paul Pry, Squire Clarke, Rob Roy; 3, Mr. J. Soorn, Duke of Leeds, Marchioness, Nulli secundus, Nonpareil, Lydia, Weldon's Cleopatra, Paul Pry. Maiden Growers' Prizes: *Scarlet Bizarre*, Weldon's Cleopatra, and *Crimson do.*, Lord Milton, C. Lorimer, Esq.; *Scarlet Flake*, Rowton, R. Alison, jun. Esq.; *Rose do.*, Cottage Girl, Mr. T. Matthews; *Purple do.*, Commander, and *Red Picotee*, Unknown, C. Lorimer, Esq.; *Purple do.*, Victoria, Mr. T. Matthews. *Scarlet Bizarre*, 1, Game Boy, and 2, Leader, Mr. J. Soorn; 3, Albion, Mr. W. New; 4, Duke of Leeds, Mr. J. Soorn; 5, Charles the Twelfth, Mr. W. Evans. *Crimson Bizarre*, 1, Lord Milton, Mr. W. New; 2, Paul Pry, Mr. J. Soorn; 3, Tally ho! Mr. W. Evans; 4, Bloomsbury, Mr. J. Soorn; 5, Taylor's William the Fourth, Mr. J. Whalley. *Scarlet Flake*, 1, Ely's Défiance, and 2, William the Fourth, Mr. W. New; 3, Unknown, R. Jones, Esq.: 4, Lydia, Mr. J. Soorn; 5, Lord Derby, Mr. J. Whalley. *Pink or Rose Flake*, 1, Marchioness of Westminster, Mr. J. Soorn; 2, Lady Gardner, Mr. W. Evans; 3, Apollo, Mr. J. Soorn; 4, Duchess of Devonshire, Mr. W. Evans; 5, Cottage Girl, Mr. W. J. Gandy. *Purple Flake*, 1, Princess Charlotte, Mr. W. Evans; 2, Weldon's Cleopatra, Mr. J. Soorn: 3, Enchantress, Mr. W. Evans; 4, Queen of Sheba, Mr. W. New; 5, Bellerophon, Mr. W. J. Gandy. *Red Picotee*, 1, Mrs. Horner, Mr. J. B. Leatherbarrow; 2, Lady Howden, Mr. J. Soorn; 3, Wellington, Mr. W. Evans; 4, Mark Anthony, and 5, Nonpareil, Mr. J. Soorn. *Purple Picotee:* 1, Nulli secundus, Mr. J. Soorn; 2, Beauty of Warley, Mr. W. Evans; 3, Victoria, Mr. J. Soorn; 4, Fair Ellen, Mr. W. Evans; 5, Kay's Monarch, Mr. Whalley. *Best Rose and best Yellow Picotee*, M. W. New. Pansies, 20 *Varieties:* 1, T. O'Grady, Esq.; 2, Mr. W. Thompson; 3, T. O'Grady Esq.; 4, do. The winner of the first pan is precluded from winning the second. Seedling Pansies, 1842, Mr. W. New. Stove Plants: J. Sothern, Esq. Greenhouse Plants: 1, J. G. Carter, Esq; 2, R. Leyland, Esq.; 3 and 4, Mrs. Cropper. Ericas: 1, Mrs. Cropper; 2 and 3, R. Leyland, Esq. Herbaceous Plants: 1, 2 and 3, Mrs. Cropper. Dahlias: 1, Mr. T. Rawson; 2, R. W. Preston, Esq.; 3, Mr. W. Thompson. Basket of Plants: Mrs. Cropper. Basket Cut Flowers: 1, Rev. J. Brooks; 2, R. Alison, jun., Esq. Basket of Fruit and Vegetables: R. Moon, jun. Best Pine: 1, R. Leyland, Esq; 2, J. Sothern, Esq. Melon: 1, J. Sothern, Esq.: 2, Mrs. Phillips: 3, R. Leyland, Esq. Peaches: R. Leyland, Esq. Apricots: 1, R. Leyland, Esq.; 2, Mr. T. Harrison. Black Grapes: 1, T. Orford, Esq; 2, T. B. Molyneux, Esq.: 3, Mrs. Cropper. White Grapes: T. Orford, Esq.; 2, Mrs. Cropper. Black Currants: Mrs. Cropper. White Currants: Mr. T. Matthews. Red Currants: T. B. Molyneux, Esq. Cherries: 1, R. Alison, jun., Esq.; 2, T. B. Molyneux, Esq. Pears: Mr. T. Harrison. Apples: Mr. J. Soorn. Gooseberries: *Red, White, Yellow, and Green*, Mr. T. Matthews. Apples, 1841: Mr. W. J. Gandy. Onions (*Autumn-sown*): R. Leyland, Esq. Onions (*Spring-sown*): Mr. T. Matthews. Celery: 1, W. P. Freme, Esq.: 2, R. Jones, Esq. Cauliflowers: 1, W. Garstang, Esq.; 2, R. Leyland, Esq. Lettuce: 1, Mr. W. E. Makin; 2, W. P. Freme, Esq. Cucumbers: 1, T. B. Molyneux, Esq.: 2, Mr. W. J. Gandy; 3, J. G. Carter, Esq. Cabbages: Mr. T. Rawson. Carrots: J. G. Carter, Esq. Turnips: W. P. Freme, Esq.

Royal Horticultural Society of Cornwall, Sept. 22.—This exhibition was held in the Polytechnic Hall, Falmouth, where the following prizes were awarded:—Fruit: Pine-apple, 1 and 2, J. Vivian, Esq. Best bunch of Grapes, 1, J. Vivian, Esq.; 2, J. P. Magor, Esq. *Best dish of ditto*, 1, J. Vivian, Esq.; 2, J. P. Magor, Esq. *Best dish of out-door ditto*, G. C. Fox, Esq. Melon: 1, W. Daubuz, Esq.; 2, Sir C. Lemon, Bart., M.P. Best Collection of dessert Pears: *silver medal*, 1, Mr. S. Treseder; 2, Sir C. Lemon, Bart., M.P. Best 6 ripe dessert Pears: 1, Mr. J. Bishop, jun.; 2, Mr. S. Treseder. Best Collection of dessert Apples, Mr. S. Treseder. Best 12 ripe dessert Apples: 1, Mr. S. Treseder; 2, R. W. Fox, Esq. Best dish of Exotic Fruit (*Madras Citrons*), G. C. Fox, Esq. *Oranges*, J. S. Enys, Esq. Extra.—*Seedling Apples*, W. Tweedy, Esq. *Apples*, 1, Mrs. Bull, and J. S. Enys, Esq. *Pears*, Mr. J. Bishop, jun. Collection of Stove Plants in flower (Æschynanthus grandiflorus, Brasavola cucullata, Oncídium papílio, Catasetum Claveringi, Oncídium carthaginense, Catasetum Hoókeri, Vinca ocellata, V. rósea, Ixora crocata, Strelítzia reginæ, Oncídium lúridum, Catasetum lúridum, Justícia cárnea, Ardísia crenulata, Xylophyllum augustifólium, Clerodendrum speciosissimum), J. P. Magor, Esq.; *best single specimen* (Achimenes longiflora), G. C. Fox, Esq. Climbing Greenhouse Plant (Hoya carnosa), J. P. Magor, Esq. Best named Specimen (Caméllia althæiflora), S. Davey, Esq. Miscellaneous Collection of Ornamental Plants, G. C. Fox, Esq. Most ornamental Plant which has not previously flowered (Achimenes longiflora), W. Daubuz, Esq. Roses (New China, Anna Maria, microphylla major, Yellow China, Bengal Hermit, Highclere seedling), R. W. Fox, Esq. Fu'chsias (fulgens, tricolor, globosa rósea, Youelli, corymbiflora, Grovehíllii), G. C. Fox, Esq.; 2 (corymbiflora, Meteor, Fairy, Hutchesónia, Invincible, fulgens multiflora), W. M. Tweedy, Esq. Sa'lvias (chamædryoides, coccínea, patens, involucrata), J. Vivian, Esq. Phloxes (odorata, omniflora, cordata, reflexa, Thompsonii, paniculata), J. P. Magor, Esq. Hollyhocks, Mr. J. Treseder. Cockscombs, J. S. Enys, Esq. Marygolds, J. S. Enys, Esq. Asters (*German or China*), 1, W. M. Tweedy, Esq.; 2, J. Vivian, Esq. Pentstemons, J. P. Magor, Esq. Annuals, J. P. Magor, Esq. Perennials: 1, G. C. Fox, Esq.; 2, Sir C. Lemon, Bart., M.P. Collection of Heartsease, W. Hockin, Esq. Best Dahlias: 24 *blooms* (Defender, Constantine, Brown's Advocate, President of the West, Amato, Monarch, Beauty of Avon Vale, Holmes's Exquisite, Bishop of Salisbury, Mrs. Neeld, Andrew Hofer, Beauty of the Plain, Argo, Virgin Queen, Grace Darling, Nicholas Nickleby, Rosa, Maid of Bath, Wilmer's Ringleader, Lee's Bloomsbury, Conservative, Bridesmaid, Keynes' Constancy, Scarlet Defiance), S. Davey, Esq.; 2, G. C. Fox, Esq., Grove Hill. 20 *Varieties* (Wilmer's Ringleader, Maid of Bath, President of the West, Amato, Holmes's Exquisite, Mrs. Neeld, Walker's Unique, Constantine, Grace Darling, Argo, Scarlet Defiance, Monarch, Lee's Bloomsbury, Andrew Hofer, Conservative, Beauty of the Plain, Bishop of Salisbury, Rosa, Nicholas Nickleby, Bridesmaid), S. Davey, Esq.; 2, President of the West, Beauty of the Plain, Grand Tournament, Maid of Bath, Fanny Keynes, Phenomenon, Hylas, King of Roses, Danecroft Rival, Pamplin's Bloomsbury, Euclid, Ringleader, Bridesmaid, Essex Rival, Suffolk Hero, Lee's Bloomsbury, Enterprise, Egyptian Prince, Dodd's Mary), J. Vivian, Esq. 10 *blooms* (Defiance, Lewisham Rival, Indispensable, Widnall's Eclipse, Grace Darling, Marchioness of Breadalbane, Burnham Hero, Lee's Bloomsbury, Egyptian Prince, Beauty of the Plain, Fanny Keynes), G. C. Fox, Esq.; 2, W. Daubuz, Esq. *Best* 10 *striped or tipped* (Ansell's Unique, Star of Bethlehem, Sparry's Beauty of the Plain, Mary Queen of Scots, Phenomenon, Purpúrea alba, Dodd's Mary, Painted Lady, Maid of Bath), W. M. Tweedy, Esq. *Best* 10 *Selfs* (Advancer, Hylas, Climax, Springfield Rival, Hope, Scarlet le Grand, Grace Darling, Magnum bonum, Lee's Bloomsbury, President of the West), W. Daubuz, Esq. Ornamental Device, *formed of ditto*, J. S. Enys, Esq. Bulbs in Flower, J. Vivian, Esq. Hardy Climber in Flower, 1, W. M. Tweedy, Esq.; 2 (Bignónia radicans), R. W. Fox, Esq. Extra.—*Stove group* (Gongora maculata, G. fulva, Oncídium sphacelatum, Stanhópea graveolens, Zygopétalum rostratum, Epidendrum ciliare, Achimenes longiflora), Sir C. Lemon, Bart., M.P. *Dahlia Device*, Mr. T. Treseder. *Succulent Plants*, Sir C. Lemon, Bart., M.P. Vegetables.—White Beet, J. S. Enys, Esq. Red Beet, Sir C. Lemon, Bart., M.P. Carrots, J. S. Enys, Esq. Spinach, J. Vivian, Esq. Tomatoes, Sir J. C. Rasleigh, Bart. Capsicums, Sir C. Lemon, Bart. Celery, W. Daubuz, Esq. Salad, W. Daubuz, Esq. Market Gardeners' Prizes.—Best basket of Vegetables, 1, Mr. J. Treseder; 2, Mr. S. Treseder. Extra.—*Seeding Potatoes*, A. Fox, Esq. *Pumpkin raised from seed from Naples*, G. C. Fox, Esq.—*West Briton.*

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Double Red Indian Azalea. (*Greenhouse Shrub.*)—The flowers of this variety are large and splendidly coloured, but very deficient in beauty of form. It is, however, rare, and a very distinct kind—two circumstances that give it value in the eyes of a collector. It is of Chinese origin; and, like other kinds, strikes readily from cuttings, or it may be worked upon the more common varieties. When rooted, the young plants ought to be potted off in rich peat soil, having mixed with it a considerable portion of sand. It requires the protection of a greenhouse during winter, and should then be placed in the lightest situation; but if it is kept there in summer, it ought to be partially shaded. It will, however, do very well then out of doors. While it is growing freely, manure water will be found very beneficial.—*Bot. Reg.*

Indigófera dósua. The Dosua Indigo. (*Hardy shrub.*) Leguminosæ. Diadélphia Decándria.—When in flower, this plant is very pretty, forming a straggling bush, whose bright deep rose-coloured blossoms are highly ornamental. When out of flower it is rather shabby in appearance, and is therefore not well suited for growing singly. It was raised in the Garden of the Horticultural Society, from seeds sent to England by Dr. Falconer from the Botanical Garden of Saharunpur. It flowered for the first time in May 1840; but subsequently it has produced blossoms occasionally through the summer. What gives it its chief value is, that it appears to be a shrub sufficiently hardy to stand an ordinary winter in the open border, and grows vigorously in any good rich garden soil. It flowers freely during the months of July and August in the open border, but earlier if kept in the greenhouse. It is easily increased from cuttings of the young wood, treated in the ordinary way, or by seeds. It would make a fine object if planted in Devonshire or Cornwall, where no doubt it would attain to a large size.—*Bot. Reg.*

MISCELLANEOUS.

Calcutta.—Advices to the 11th of August announce, that Dr. Wallich was about to proceed to the Cape for two years on medical certificate, and that the students of the Medical College proposed, previously to his departure, to present him with a token of gratitude in the shape of an address and a piece of plate. Government has appointed Mr. W. Griffith to the charge of the Botanic Garden during Dr. Wallich's absence, and Dr. Voigt takes the superintendence of the Institution till Mr. Griffith's arrival. A better appointment than that of Mr. Griffith could not have been made.

Flowers in Religious Buildings.—We cannot but admire the practice of the Church of Rome, which calls in the aid of floral decorations on her high festivals. If we did not feel convinced that it was the most bounden duty of the Church of England, at the present moment, to give no unnecessary offence by restorations in different matters, we should be inclined to advocate, notwithstanding the denunciations of some of the early Fathers, some slight exception in the case of our own favourites. We shall not easily forget the effect of a long avenue of Orange-trees in the Cathedral of St. Gudule at Brussels, calling to mind as it did the expression of the psalmist—"Those that be planted in the house of the Lord shall flourish in the courts of our God." The White Lily is held throughout Spain and Italy the emblem of the Virgin's purity, and frequently decorates her shrines; and many other flowers, dedicated to some saint, are used in profusion on the day of his celebration. The Oak-leaf and the Palm-branch have with us their loyal and religious anniversary, and the Holly still gladdens the hearts of all good Churchmen at Christmas—a custom which the Puritans never succeeded in effacing from the most cant-ridden parish in the kingdom. Latterly, flowers have been much used among us in festivals, and processions, and gala-days of all kinds—the Dahlia furnishing, in its symmetry and variety of colouring, an excellent material for those who, perhaps, in their young days sowed their own initials in Mustard-and-cress, to inscribe in their maturer years their sovereign's name in flowers. Flowering plants and shrubs are at the same time becoming more fashionable in our London ball-rooms. No dread of "noxious exhalations" deters mammas from decorating their halls and staircases with flowers of every hue and fragrance, nor their daughters from braving the headaches and pale cheeks which are said to arise from such innocent and beautiful causes. We would go one step further, and replace all artificial flowers by natural ones, on the dinner-table and in the hair. Some of the more amaranthine flowers, as the Camellia and the Hoya, which can bear the heat of crowded rooms, or those of regular shapes, as the Dahlia and others, would, we are sure, with a little contrivance in adjusting and preserving them, soon eclipse the most artistical wreaths of Natier or Forster, and we will venture to promise a good partner for a waltz and for life to the first fair *débutante* who will take courage to adopt the natural flower in her "sunny locks."—*Quarterly Review.*

GARDEN MEMORANDA.

Putteridge Bury, near Luton, Bedfordshire.—This place is well conducted, and is under the management of Mr. Fish. The kitchen-garden is clean, and the wall-trees are looking healthy. There are two ranges of houses; one of which is devoted to the cultivation of Vines and Peaches; the other, to Pines. The Peach-trees are grown as standards, and produce abundant crops of fruit. Both the Vines and Pines are looking healthy; and we observed, trained over the back of the Pine stove, some strong Cucumber plants grown in pots, and intended for winter produce, as it is customary here to cut this fruit all the year round. In a part of the kitchen-garden that has been lately added, we saw a system of growing Celery, practised by Mr. Fish, which, during the late dry season, has been attended with great success. It is planted in beds, containing about three rows of plants, and upon the ridges between the beds was sown a row of Peas, which shaded the Celery from the sun and kept the ground more moist about the plants; these certainly show the good effects of this method by the superior luxuriance of their growth over other rows which have not been thus treated. There is also a number of young fruit-trees planted in the following manner:—The earth is raised in hillocks, so that when planted the roots of the trees are not much, if at all, below the level of the garden. The subsoil being very heavy, this system of planting has been attended with the best results; and probably if it was more generally adopted, we should not see so many fruit-trees suffering from the laceration of root-pruning. The lawn, although not completed, has yet a pretty appearance, containing some young plants of the more rare kind of shrubs, &c. The collection of Cratæguses deserves especial notice. We also observed two clumps of Rhododendrons growing in the natural soil of the garden in a vigorous condition, and loaded with flower-buds for another season. On the lawn are two *iron vases* filled with plants, which grow in them equally as well as they do in pots made of the most porous materials. The vases are thoroughly drained; but that is essential to the good cultivation of all plants, let them be grown in any description of pot or vase. The conservatory is a neat building, with a veranda at the end, which leads to the kitchen-garden; the other is adjoining to the sitting-room. It is kept supplied with flowering plants in ornamental vases; on the columns which support the roof are trained some of the best kinds of climbing Roses, Jasmines, &c. The farm-yard is a model of perfection, and is a proof that this portion of a gentleman's estate is capable of being kept, comparatively, as clean as the lawns, walks, &c.—*J. A.*

Reviews.

The Botanical Text-Book. By Asa Gray, M.D. 8vo.
Wiley and Putnam.

If Botanical students are behindhand in their knowledge of the actual state of Botany, it is not the fault of their teachers; for scarcely a season elapses without the appearance of some good introduction to the science. When we were boys, the only tolerable elementary books that could be found in the English bookshops were Lee's translation of the Philosophia Botanica of Linnæus, and Smith's very meagre Introduction to Botany. No means whatever existed of gaining an acquaintance with the Natural System of Botany, which the writers of those days, knowing nothing about it themselves, were contented with abusing; and as for the philosophy of the science, the English popular authors were evidently ignorant of there being any philosophy in it, for there was none in their Botany. Fortunately, that race is almost extinct.

The present work is formed on the model of Lindley's Elements of Botany, but it treats the subject more in detail. It has more letterpress and fewer woodcuts, and contains a skilful exposition of existing opinions. Students, for whom it is intended, will no doubt find it very useful. Formal criticism of such a work would be out of its place in this journal; we shall therefore content ourselves with observing, that the author enters fully into the existing views of vegetable structure, and explains them with his usual talent. The most material omission is that of an artificial analysis of the Natural Orders, without which a young Botanist can scarcely stir in his study of the Natural System. It is promised, indeed, at p. 202, but seems to have been accidentally forgotten.

As usual, we offer an extract from the work, to illustrate the author's manner of treating his subject; and for this purpose select the following from the introductory matter :—

"1. The most simple definition of the three kingdoms of nature which has yet been offered, is that of the immortal Linnæus: 'Lapides crescunt; Vegetabilia crescunt et vivunt; Animalia crescunt, vivunt, et sentiunt.' That is to say, the vegetable and animal kingdoms are distinguished from the mineral by the possession of life; and the animal from the vegetable by sensation.

"2. The bodies of animals and plants are composed of fibres, tubes, and cells, exhibiting a structure which is in general visible to the naked eye; and these minute fibres, vessels, &c., being the *organs* or instruments of life, the bodies themselves are termed *organized* or *organic*. Mineral bodies, having no such structure, are said to be *inorganized* or *inorganic*. Animals and vegetables grow from a minute germ to a size and form nearly definite for each species, increasing by means of matter received into their organs, by whose action it undergoes certain transformations: during life they resist the external forces (chemical and mechanical) which tend to decompose them; and their existence is terminated by death, when they become subject to the ordinary laws of inorganic nature. Mineral bodies, by the influence of attraction, under favourable circumstances, sometimes assume regular and definite forms; but in this case they increase indefinitely by the superposition of similar particles upon those already deposited, and undergo no further change, except from the influence of external forces.

"3. Organic beings may be said to increase, preserve, and reproduce *themselves*, under the influence of the laws of life impressed upon them. Neither they, nor any of their products, can be formed by art. The chemist cannot produce muscular or woody fibre, nor starch, gum, or sugar: he can, at most, only imitate nature in the transformation of some of these products into others. But many of the inorganic compounds which occur in nature may be produced by the chemist; and it is probable, as a distinguished chemist (Johnston) has recently remarked, that, with few exceptions, nature might be imitated in the formation of any of her mineral productions, were any corresponding benefit likely to be derived from the expenditure of time and labour.

"4. Animals and vegetables, or at least their organic portion (that which lives and grows), are essentially composed of only four elementary substances, viz. Carbon, Hydrogen, Oxygen, and Nitrogen. Inorganic bodies consist of one, two, or any number of the fifty-five known elements or simple substances.

"5. The limits between the two kingdoms of organic nature, however, are by no means so clearly defined, either by the character assumed by Linnæus, or by any other that has yet been suggested. Although sensation, and certain properties consequent upon, or necessarily connected with, the possession of this faculty in any considerable degree (viz. voluntary motion, the choice of food, &c.) are the obvious characteristics of animal, as contradistinguished from vegetable life; yet it is no less true that plants are to a certain extent *sensitive* to external agents, and that particular species exhibit, in some of their actions, perhaps, a higher degree of sensibility than many of the lowest animals. The connexion, moreover, between the two kingdoms takes place through tribes of the very simplest organization, and of the minutest size (the infusory animals on one side, and the microscopic Algæ on the other); whose appearance and mode of life are often so very similar, that the same species are not unfrequently claimed both by the zoologist and the botanist. Since, then, perfectly absolute distinctions have not been discovered, we must be content with general definitions.

"6. Plants, in general are organized living bodies, fixed to the earth or other substance upon which they grow, nourished by fluid food, which is taken directly into their system by absorption from without, and digested by the action of light in organs exposed to the atmosphere. Animals, in general, are endowed with a high degree of sensation, with the power of locomotion and of selecting their food, which is received into an internal bag or stomach, and digested without the agency of light.

"7. A plant, philosophically considered, is not a simple individual, as is commonly supposed, but an aggregation of individuals (buds), which in their development (into branches) ordinarily remain united with the parent. Hence they may be multiplied by spontaneous or artificial division of their trunk; in which respect they are analogous, not to the higher order of animals, which are simple individuals, and, therefore, incapable of multiplication by mechanical division, but strikingly so to the compound animals of the lowest grade, such as Polypi and Corallines."

CALENDAR OF OPERATIONS *for the ensuing week.*

AFTER the fruit is all gathered and the winter roots safely secured, the gardener can afford to devote more time to improvements in his garden, among which not the least important is the renovation of old or the formation of new wall-borders. As this is a matter which is often ill understood, and consequently ill executed, a few observations upon it may not be inappropriate at this favourable season for its accomplishment. Because the roots of trees are naturally disposed to penetrate deeply into the earth in quest of food, some persons conclude that it is right and proper they should do so in all cases, and in accordance with this notion, deep pits are dug and filled with rich soil for their reception. If the roots are not too much mutilated in transplanting, very strong shoots are made, which must necessarily be cut back at pruning time, to prevent the trees from becoming naked at the bottom; and as this shortening causes the production of still stronger shoots in the following year, the foundation is thus laid of a luxuriant and sterile habit, which age does not counteract, because as the roots make their way to the bottom of the border, they still find abundance of food and moisture; the trees, therefore, continue to grow vigorously and late in autumn, and the wood is in consequence imperfectly formed, which is one great cause of canker as well as of barenness. If old wall-trees of habitual unfruitfulness are closely examined, the defect will be found, in most cases, to arise from the cause above mentioned, coupled with a bad system of pruning and training in their youth. Although it is hardly possible to bring the roots of trees under perfect control, yet some approach might be made towards that desirable end by a proper construction of the borders, which will be further adverted to in our next Calendar.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—Young plants in pits ought now to be assorted and regulated against winter; in doing which, it will be advisable to keep the same sized plants and the same sorts as much together as possible. Small plants from late suckers and crowns may be stowed very close, to economise space; but those of larger growth ought not to be crowded. When much fresh bark is required, take care to mix it well with the old, and, if a strong heat is not apprehended, small pots might be plunged at once to their rims; the larger ones, however, had better have the bark raised in ridges between them, to be afterwards drawn close, as occasion requires, without disturbing the plants. Be very cautious now in watering; yet, if fire-heat is applied, the plants should be often looked over.

VINERY.—Grapes which are intended to be kept late must be frequently examined, and the decaying berries taken off, particularly in damp weather. Keep the floors dry, and do not place any plants which require water in the house. Robins and mice sometimes seriously damage late Grapes before they are observed.

PEACH-HOUSE.—Let the house which it is proposed to force early be got ready at the first convenient opportunity. The surface of the borders, being exhausted by repeated waterings, should be carefully taken off with a fork, and replaced with fresh soil. If the trees seem to want vigour, take away as much of the soil as can safely be removed without injury to the roots, and let that which is added have a small portion of rotten dung mixed with it. Worn-out trees in any of the houses should now be replaced by bearing-trees from the walls. If the directions we have given be followed in planting, trees of any size may be removed, not only with perfect safety, but even without the loss of a crop.

CUCUMBERS AND MELONS.—The principal value of Melons now is their scarcity; they are not of much account for eating. As soon as symptoms of maturity are observed, cut the fruit, and set them in a warm place to ripen more perfectly. Cucumber plants must not be permitted to overbear themselves at any time, but more especially while the plants are young. It is much better to insure a constant moderate supply by judicious management, than to obtain a great produce at one time and none at another.

Out-door Department.

ASPARAGUS.—Young plantations will probably still retain their freshness, in which case the tops ought not yet to be cut off. It is a common custom after the beds are cleaned to spread manure on the surface, and then to dig the alleys and cover the dung on the beds with part of the soil. This top-dressing of manure can only benefit the plants by the rain washing its nutritive particles down to the roots; it might, therefore, lie exposed all winter, and be forked in when the beds are dressed in spring. If the alleys are filled with roots, they ought not to be be dug out; a dressing of manure should be lightly turned in instead.

BEET.—Take up the roots and house them for winter use. In digging these, great care is necessary not to break off the end of the root, or to wound the skin, for when this is done the colouring matter is extracted by boiling. All the trimming required is to cut off the large outer leaves, and then the roots should be stacked in dry mould or sand, like Carrots and Parsneps.

CELERY.—Take advantage of dry weather to earth the principal stock.

MUSTARD AND CRESS.—Keep a regular succession in boxes or frames.

POTATOES.—Except very late varieties, these might now be generally taken up, at which time they can be much more readily sorted into sizes than after they are housed or pitted.

SALSAFY AND SCORZONERA should be taken up and housed.

TOMATOES.—Gather all the unripe fruit and hang them in the hothouses, where they will ripen sufficiently to be of service.

ORCHARD.—Walnuts should now be gathered, cleared from the husks at once, and buried in damp sand, which will preserve the freshness of the kernels. Late Pears and Apples ought also to be got in. If any Currants yet remain under mats, they should be exposed for an hour or two on fine days to dry them. Persevere in planting all sorts of fruit-trees while the weather is so favourable and the soil in such fine condition.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Continue to keep the air of the Orchidaceous house comparatively dry, in order that the leaves may be gradually ripened and hardened, so as to be able to stand the dull weather of the coming winter. Some of the plants which have perfected their growth require very little water; which must now be given to all with great caution. The same remark applies to climbers which are dying back. When this is the case, the opportunity should be embraced for cleaning the old stems, wires, and rafters.

GREENHOUSE AND CONSERVATORY.—Prune and tie rampant climbers in the Conservatory; clean all the plants, and neatly rake the borders; but previously examine the soil round the roots of large established plants, as it is sometimes dry at a little depth when it appears moist enough on the surface. Give Greenhouse plants abundance of air, and suffer no dead leaves or withered blossoms to remain upon them. Chrysanthemums that have filled their pots with roots should have manure-water occasionally; these plants must have plenty of air, and not be set at a great distance from the light, or they will not bloom strongly.

PITS AND FRAMES.—Place a few Hyacinths, &c., which upon examination are found to have pushed fibres, in a gentle heat; also introduce plants of Rhododendron, Kálmia, Azálea, Caméllia, &c, into heat; but do not attempt to force them hastily. Rooted cuttings of plants for bedding out next season should be exposed to the air whenever it can be safely done.

Out-door Department.

The planting of new Shrubberies or single ornamental plants, whether deciduous or evergreen, ought to be proceeded with, while the ground is in good condition. Tulips, Hyacinths, Anemones, &c. for beds, and Dog's-tooth Violets, Crocuses, and similar small bulbs for edgings, should be planted, now that the flower-garden beds are cleared of other things. Hollyhocks, and other biennials, may yet be planted, if necessary; observing that those plants whose beauty depends much upon a vigorous growth, as Hollyhocks, should have a spadeful or two of fresh good soil put about their roots. See that the crowns of valuable Dahlias are not exposed to danger by sudden frosts. Gather seeds of all kinds.

NURSERY AND FOREST DEPARTMENT.

NURSERY.—Collect, as they ripen, seeds of trees and shrubs to be sown in spring. Those with hard shells, as Holly and Hawthorn, are usually buried in heaps to facilitate the decay of their coats. Nuts of all kinds may be mixed with sand, or sown when gathered, as most convenient.

FOREST AND COPPICE WOODS.—Presuming that the directions we have given for preparing the ground, &c. have been followed, nothing will now remain to hinder the progress of planting, which should therefore be carried on, to the exclusion of all other woodwork.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending Oct. 13, 1842, as observed at the Horticultural Garden, Chiswick.

Oct.	Barometer.		Thermometer.			Wind.	Rain.
	Max.	Min.	Max.	Min.	Mean.		
Friday 7	30.298	30.258	61	39	50.0	N.E.	
Saturday 8	30.436	30.348	58	39	48.5	N.E.	—
Sunday 9	30.490	30.447	59	49	54.0	N.E.	
Monday 10	30.451	30.386	64	34	49.0	N.E.	—
Tuesday 11	30.363	30.232	64	44	54.0	N.E.	—
Wednesday 12	30.286	30.244	54	47	50.5	N.E.	
Thursday 13	30.258	30.220	55	37	46.0	N.E.	
Average	30.369	30.312	59.3	41.3	50.3		.00

Oct. 7. Overcast; cloudy and fine.
8. Fine; overcast; clear at night.
9. Light haze; cloudy and fine; overcast.
10. Lightly overcast and fine throughout.
11. Foggy; exceedingly fine with bright sun; overcast at night.
12. Overcast; cloudy and fine; overcast.
13. Lightly overcast; very fine; clear at night.
Mean temperature of the week 2½° below the average.

State of the Weather at Chiswick during the last 16 years, for the ensuing Week ending Oct. 22, 1842.

Oct.	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds.							
						N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

Sat. 22	59.5	46.0	52.7	11	0.36	—	—	3	1	5	3	2	2

The highest temperature during the above period occurred on the 21st, in 1830—thermometer 73°; and the lowest on the 21st, in 1841—thermometer 26°.

REPORT ON COVENT GARDEN MARKET,

For the week ending Oct. 14, 1842.

THE market has been well supplied during the past week, particularly with the various kinds of autumnal fruit; but trade continues very dull. *Fruit:* Amongst the Pines, we observed the Green Antigua, noticed at p. 669 in last week's *Chronicle;* with several handsome specimens of the Queen and Providence. The Black Hamburgh Grapes are very fine, from 2*s.* to 2*s.* 6*d.* per lb. Pears are fetching rather a better price than they did last week, the Louise Bonne and Brown Beurré being from 3*s.* to 5*s.* per half-sieve; the Marie Louise from 3*s.* to 4*s.*, and Gansell's Bergamot from 5*s.* to 8*s.* per half-sieve. Apples have not varied: amongst the culinary kinds, one, called the White Harvey, is very large, and appears to be an excellent sort. This, with the Alexander Apple, was selling from 3*s.* to 4*s.* per bushel. Damsons are becoming less plentiful, and fetch about 5*s.* per sieve. Cucumbers are tolerably abundant, from 2*s.* to 6*s.* per dozen. Berberries are from 2*s.* 6*d.* to 3*s.* per half-sieve. *Vegetables:* The prices of Broccoli, Cabbages, and other Greens, continue the same as in our last report; some large Drumhead Cabbages, which have appeared, fetch from 4*d.* to 1*s.* each. Carrots are very good, and are selling from 3*s.* to 5*s.* per dozen bunches. Onions are rather dear, and fetch from 4*s.* to 6*s.* per bushel; the green ones, about 4*d.* per bunch. The Red Celery is very fine; one bundle, containing seven heads trimmed in the ordinary manner, weighing 27 lbs. Endive and Lettuces are pretty abundant, from 1*s.* to 1*s.* 6*d.* per score. Parsneps have been in the market for some time, but they are now becoming good, and fetch about 1*s.* per dozen. Salsafy and Scorzonera are selling from 1*s.* 3*d.* to 1*s.* 6*d.* per bundle. Long Radishes are from 9*d.* to 1*s.* per dozen bunches; and the Turnip-rooted ones from 1*s.* to 1*s.* 6*d.* per dozen bunches. *Flowers:* The Cut Flowers are remarkably good, and consist of Allemanda cathártica, Stephanotis floribundus, Trevirana coccínea, Leschenáultia formosa, Amaryllises, Jasmines, Roses, Dahlias, &c., with some bunches of early and very good Neapolitan Violets.

PRICES, SATURDAY, OCT. 15, 1842.—FRUITS:—

Pine Apple, per lb. 3*s* to 5*s*
Grapes, per pound, 1*s* 6*d* to 2*s* 6*d*
— Muscats, per pound, 2*s* 6*d* to 3*s*
— Spanish, 9*d* to 1*s*
— Portugal 1*s* to 2*s*
Plums, dessert, per punnet, 1*s*
Damsons, per hf. sieve, 2*s* 6*d* to 3*s* 6*d*
Bullace, per hf.-siv., 2*s* to 2*s* 6*d*
Apples, dessert, per bush., 2*s* 6*d* to 6*s*
— Kitchen, 2*s* to 5*s*
Pears, dessert, per hf.-sieve, 3*s* to 5*s*
Berberries, per hf.-sieve, 3*s*
Cucumbers, per doz., 2*s* to 6*s*
Oranges, per doz., 1*s* to 3*s*
— per 100, 6*s* to 20*s*
Lemons, per doz. 2*s* to 4*s*
— per 100, 10*s* to 20*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 3*s*
Chesnuts, per peck, 4*s* to 8*s*
Walnuts, per bush., shelled, 12*s* to 20*s*.
Filberts, English, per 100 lbs. 55*s* to 70*s*
Cob Nuts, per 100 lb., 80*s*
Nuts, per bushel—
— Brazil, 16*s* to 20*s*
— Barcelona, 24*s*

VEGETABLES.

Savoys, per doz. 9*d* to 1*s*.
Cabbage, per doz. 6*d* to 1*s* 6*d*
— plants, per doz. 1*s* 6*d* to 2*s*
— Red, for pickling, 1*s* 6*d* to 2*s*
Brussels Sprouts, per hf.-sv. 1*s* 6*d* to 2*s*
Broccoli, per bunch, 6*d* to 1*s*
Cauliflowers, per doz., 2*s* to 4*s*
Beans, Kidney, per hf. sv., 1*s* 6*d* to 2*s* 6*d*
— Scarlet, per hf.-sv. 1*s* to 1*s* 6*d*
Potatoes, per ton, 40*s* to 70*s*
— per cwt. 2*s* to 3*s* 6*d*
— per bushel, 1*s* 6*d* to 2*s*
— Kidney, per bu., 2*s* 2*s* 6*d*
Jerusalem Artichokes, per half-sieve, 1*s* 6*d* to 2*s*
Turnips, per doz bun., 1*s* 3*d* to 2*s*
Carrots, per doz. bun., 3*s* to 5*s*
Red Beet, per dozen, 9*d* to 1*s*
Parsneps, per dozen, 1*s*
Scorzonera, per bundle, 1*s* 3*d* to 1*s* 6*d*
Salsafy, per bundle, 1*s* 3*d* to 1*s* 6*d*
Horse Radish, per bundle, 2*s* to 5*s*
Radish, per doz. hands (24 to 30 each) 9*d* to 1*s*
— Turnip, p. doz. bch., 1*s* to 1*s* 6*d*
Spinach, per sieve, 1*s* to 1*s* 6*d*
Leeks, per doz. bun., 1*s* 6*d* to 2*s*
Shallots, per lb., 1*s*
Onions, per bushel, 4*s* to 6*s*
— Green, p. doz. bun. 4*s*
— Spanish, per doz. 1*s* to 5*s*
— for Pickl., per hf.-sv. 2*s* to 4*s*
Garlic, per lb. 6*d* to 8*d*
Lettuce, Cabbage, p. sc., 1*s* to 1*s* 3*d*
— Cos, 1*s* to 1*s* 6*d*
Endive, per score, 1*s* 3*d* to 1*s* 6*d*
Celery, p. bd., (12 to 15) 9*d* to 2*s*
Small Salads, per punnet, 2*d* to 3*d*
Watercress, per doz. sm. bun. 4*d* to 6*d*
Parsley, per doz. bun., 1*s* to 2*s* 6*d*
Tarragon, per doz. bun., 2*s* to 3*s*
Sage, per doz. bunches, 1*s* 6*d* to 2*s*
Mint, per doz. bunches, 2*s*
Vegetable Marrow, per doz., 8*d* to 1*s*
Tomatoes, per hf. sv. 2*s* to 3*s* 6*d*
Capsicums, Ripe, per 100, 4*s* to 4*s* 6*d*
Mushrooms, per pottle, 1*s* to 1*s* 3*d*
— Field, per bus., 5*s* to 6*s*

Notices to Correspondents.

WE shall be obliged if our Correspondents, in their future communications, will take care that no general question relating to *different* subjects is asked in the same paragraph, and that each question is headed with the principal subject. *One side only of the paper should be written on*, so that we may separate each question. If these directions are observed, it will greatly facilitate our obtaining answers, and will enable us to arrange our Correspondence under general heads, separating those questions and answers which are of interest merely to individuals, from such as are of general interest.

Nitrate of Soda.—*Winton* will find a solution of nitrate of soda, in the proportion of two teaspoonfuls to a gallon of rain-water, too strong for watering Pelargoniums. He had better use ½ an oz. to 8 gallons of water, and watch its effects. Water them with such a solution once a week as soon as they begin to grow.—†

Salt.—*Chipping Norton.*—If you give an Asparagus-bed as much salt as it ought to have, you will no doubt bring it to such a state as to poison the roots of Vines passing through it.—†

Heating.—*Jacobus.*—On no account introduce a gas-light into your conservatory. In the first place, the gas that it disengages is apt to be injurious; and if that does not happen, it dries the air so much as to render it unfit to maintain vegetable life.—†——*Marc Antony.*—We fear there is no means of keeping the frost out of your little greenhouse, except by a vessel containing boiling-water. A. Joyce's stove is not a good contrivance, unless you convey away the fumes from it through a pipe.—†——*R. S. V.*—You may apply your hot-water apparatus in the manner you describe, provided you leave air-holes at the highest points. If you neglect this, you will not be able to get the water into the pipes that are bent downwards.—†

Open Gutters.—*A. B. C.*—The fittest material for lining the open gutters in which hot water is to circulate, is Roman cement. We do not know what Aberthaw lime is.—‡

Vines.—*J. W. C.*—As the unproductive state of your Vines proceeds from the badness of your border, we would advise you to remove the soil carefully from the roots, so as to preserve the fibres of the latter as perfect as possible. The subsoil may then be taken out to the depth of two feet, or two feet and a half, and the border may be renewed with a richer compost, previously prepared for the purpose. The Vines should be planted near the surface; and if this operation is performed as soon as they have lost their foliage, you will stand a better chance of obtaining a few bunches from them next season. The border should afterwards be well mulched with litter to protect the roots from severe frost.—‡

Ivy.—*A Subscriber.*—This plant *may* do harm to trees by encircling them with its spiral folds, which act as a ligature; and you know what happens in a hedge-row when the Woodbine twines round a branch. Ivy may also be injurious, if in very large quantity, by smothering the leaves, and intercepting the free action of light and air. In moderate quantity, and if not twined *round* the trunk or main limbs, it is not to be feared. Ivy upon a house keeps it dry and warm, which are its advantages; but it harbours insects, which is its disadvantage. It can do no harm to a stone-wall.—†

Lonicera flexuosa.—*M. G. D.*—Your plant is Lonicera flexuosa; it is a climber, and thrives best when trained against a wall or trellis-work, facing the south. It will live without protection during mild winters; and in the spring, the ends of the shoots which have been killed by the frost should be cut out, and those which are uninjured should be fastened to the wall or trellis.—‡

Catalpa.—*A Subscriber.*—Your plant of Catalpa syringæfólia, which is 10 or 12 feet high, may be removed, provided that operation is carefully performed; and, as it has not hitherto flowered, that may probably be the means of inducing it to bloom.—‡

Roses.—*Henry S.*—We cannot name the Rose from the shoot which you have sent. As it has been planted for three years without producing a flower, you had better in about a month's time, after shortening a few of the strongest branches, take it up and replant it nearer the surface of the ground. This will probably cause it to flower.—‡——*A. B. C.*—Generally speaking, the Bourbon, Noisette, and China Roses, grown as *dwarfs*, will stand the winter without protection. It is only the Tea-scented kinds which are liable, in that case, to sustain injury from frost.—‡

Fir-trees.—*T. S. P.*—You are quite right. The genus Abies consists of Firs, having the leaves destitute of sheaths, as is the case in the Spruce Fir and Cedar of Lebanon. To Pinus are referred all those Pines which have the leaves in clusters, with a sheath at the base, like a Scotch Fir. Linnæus called them all Pinus, and hence those who adopt his views speak of Pinus canadensis, and Pinus Douglasii, although both those species belong to Abies. The Cedar is not regarded by good Botanists as a genus distinct from Abies. The Deodar is a Cedar. There is no such plant as an Evergreen Larch. Araucaria imbricata is quite hardy in open, exposed places; it does not like close, confined situations.—†

Pelargóniums.—*C.*—The following list contains the greater part of those which are worth cultivating, but does not include Seedlings of the present year:—

White grounds.
Annette.
Leila.
Witch.
Queen of Fairies.
Enchantress.
Alexandrina, superb.
Eliza, superb.
Una.
Liniatum.
Pictum.
Blush and light rose.
Sylph.
Matilda.
Nymph.
Cyrus.
Britannia.
Grand Monarch.
Cerito (Gaines').
Florence.
Clarissa.
Priory Queen.
Corona.
Evelyn.
Grace Darling (Gaines').
Anna (Pamplin's).
Lord Mayor.
Lady Mayoress.
Madonna.
Criterion.
Magna Charta.
Garth's Victory.
Bridesmaid.
Sirius.
Rosetta.
Garth's Perfection.
Fanny Garth.
Jubilee.
Louis Quatorze.
Prince Albert (Gaines').
Ariadne.
Mabel.
Albion.
Alice Grey.
Joan of Arc.
Rose.
Coronation.
Lady Douro.
Rienzi.
Masterpiece.
Róseum élegans.
Wonder.
Duchess of Kent.
Circassian (Lynes').
Flash.
Grand Duke (Gaines').
Gauntlet.
Lady Denbigh.
Discount.
Prince Albert (Foster's).
Climax.
Orange.
Rising Sun.
Erectum.
Comte de Paris.
Orange Boven.
Lady Carlisle.
Prince of Waterloo.
Emily.
Corinne.
Jewess.
Queen Superb.
Village Maid.
Prima Donna.
Camilla.
Lifeguardsman.
Crimson.
Emperor (Hodges').
King (Gaines').

Your other question will be answered shortly.—*

Greenhouse Plants.—*J. C. Y.*—The following plants are ornamental, and will flower successively almost all the year round:—Prímula sinensis, Leschenáultia formosa; Azálea indica alba, variegata, and lateritia; Chorozema várium and Dicksoni, Borónia serruláta, Coleonema tenuifólia, Coronilla glauca; Kennédya racemosa, coccínea, and Marryattæ; Hardenbérgia macrophylla, Gardóquia Hoókeri, Pimelea decussata; Epacris campanulata, nivalis, impressa, and grandiflora; Statice pubérula, Fúchsias of various kinds, Genista canariensis, Correa speciosa and Harrísii, Daphne odora, Acácia armata, and Chrysánthemums of various kinds.—‡

Wintering Plants.—*Marc Antony.*—Your seedling Pansies, Carnations, and Stocks, will do better if allowed to remain through the winter in the spent hotbed, than if transplanted; they must, however, have abundance of air at all times.—‡

Bulbs.—*A Subscriber.*—If the Bulbs which you have received from the Cape have not begun to grow, they may be kept in a dry and airy place for the present, and may be potted off early in the spring; if, however, they have formed any leaves, they should be potted immediately.—‡

Hyacinths.—*Hibernia.*—Your list of Hyacinths is a very good one. After the roots have been forced, it requires three years to bring them to a tolerable state of vigour; but they are never so fine as the first season after they are imported. Hints for the management of the roots after blooming will be found at pp. 73, 121, 308, 699 of last year's *Chronicle*; and an article is already in type upon the same subject, which will appear shortly. Whether grown in Beet-roots or in glasses, the injury sustained by the root is the same.—*

Apples.—*G. L.*—These may be kept in heaps like Potatoes, if they are laid up carefully, and not bruised. If injured before being "hogged," the bruised Apples will rot, and infect the remainder.—†

Espalier Pear-trees.—*A Novice.*—Judging from the appearance of Pear-trees, in a favourable soil, that have been grafted upwards of 20 years on the Quince stock, and have been in bearing for the last 15 years, without any apparent diminution of vigour, it is probable that they will last for at least half a century. With regard to duration, much depends on the variety of Pear grafted; for some are apt to overgrow the Quince stock, forming an enlargement at the junction which ultimately prevents the circulation of sap. It is desirable to allow the branches of Pear-trees to spread considerably; but your proposed plan of extending them by a wavy training, upwards and downwards, on either side of the horizontal line which the branches of your espaliers should follow, will not succeed, for the following reasons: The downward portions of your branches will burst very weak, and the upward excessively strong; the sap, reluctant to descend, when in vigorous motion, will supply the buds and shoots too abundantly at the upper bends, and your attempts to direct it from these will prove fruitless. You may plant at 20 feet apart, for espaliers, in the usual way of training; or even at 15 feet, and train the leaders back when they reach that extent. The Horticultural Society's Catalogue of Fruits will appear shortly.—‖

Grafting.—*A. M.*—It is just possible to make Apples and Pears grow upon the same stock; but they detest each other's company, and will not long live in such close quarters. The one which is at variance with the stock will die, and make room for the other.—†

Fruit-trees for a North Wall.—*W. D.*—Having already as many Morello Cherries and Greengage Plums as you require, with room for three more trees on your north wall, you may either plant for dessert the Royal Hâtive Plum, the Royal Duke, and Elton Cherries; or, for kitchen use, the Orleans Plum, and two Kentish Cherries.—‖

Tomatoes.—*A Constant Subscriber.*—We do not know how these are to be preserved whole; nor, indeed, what use there would be in so keeping them.†——*J. R.*—To make Tomato Ketchup, bake your Tomatoes in a brown earthen pan, in a cool oven; then press out the juice and pulp through a sieve. Next, to each quart of juice and pulp add 4 lb. of Salt, 2 oz. of Shallots, 1 oz. of ground black Pepper, ¼ oz. Mace; the same weights of Allspice, of Ginger, and of Nutmeg. Pound the spices together, and boil them with the Tomato pulp for half-an-hour; then pass the mixture again through a sieve, and when cold bottle it. This will keep good for years.—†

Cauliflowers.—*Poluphloisbos.*—The ground intended to be planted with Cauliflowers in the spring will be all the better for being prepared now. It should be thrown up roughly, so that the frost may more easily penetrate it.—‡

Gourds.—*H. Owen.*—The Mammoth Gourd is harmless. The Striped Pear and Orange sorts are poisonous. We are not acquainted with the Malabar.—†

Scale Insects.—*M. G. D.*—Your best plan to eradicate these pests will be, to cut off and burn all the infested shoots which you can spare from your plants; then with gum-water to brush over the branches that are left. All that escape this process should afterwards be scrubbed off with a stiff brush.—‡

Botanical Studies.—*A. Z.*—It is very difficult to say what books you had better read, because you give no information as to your means, or station in life, or the objects you propose to attain in following the study of Botany. If you are a gardener, read the "Theory of Horticulture" very carefully; the "Natural System of Botany" may also prove useful to you. There is no reason why you should not collect cultivated specimens of plants; the great botanists are desirous of acquiring both wild and cultivated specimens, and are quite contented with the latter when they cannot procure the former. There is no cheap work in which all plants are described botanically, nor can there be—because of the immense number of species. "De Candolle's Prodromus," of which 7 octavo volumes have now appeared, and "Kunth's Synopsis," of which 4 volumes have been published, both in Latin, are the standard works at present.—†

Horticultural Society.—*Dr. G.*—With every wish to oblige you, we really cannot assist you in this matter. The Horticultural Society is maintained by the subscriptions of a numerous body of persons, to whom, *in return for their support*, seeds, fruit, and plants are given. It is not reasonable that those should partake of such advantages who do not contribute to the expenses of the Society. We trust no Fellow of the Society will so far injure it as to transfer to another the rights which are intended for himself alone; because if he does so, he encourages parsimonious persons to abstain from contributing their quota to that income, a judicious application of which produces the advantages they are desirous of possessing—for nothing.—†

Miscellaneous.—*R. Y.*—Your Apples and Pears are, 3, Loan's Pearmain; 4, Alfriston; 5, Incomparable; 6, Easter Bergamot; 7, White Doyenné; 8, Christie's Pippin; 9, Paradise Pippin; 10, Hollandbury; 11, Court of Wick; 12, Fearn's Pippin.—‖——*A. B. C.*—Your Peaches are, No. 1, Bellegarde; 2, Catherine. The Pears are, 1, 7, Brown Beurré; 2, Crassane; 3, Colmar; 4, St. Germain; 5, Chaumontel; 6, Beurré d'Aremberg; and 8, Bishop's Thumb. The Apples are, 1, Ribstone Pippin; 5, Margil; 6, Royal Russet; 8, Manks Codlin.—‖——*Y. Z.*—The plant is Sinníngia villosa. The flowers of your Anagallis, raised from the seed of A. Phillípsii, are certainly larger than any we have seen, and of a rich blue colour.—†——*J. C. Y.*—By early application at our office, you may procure No. 34 of this year's *Chronicle.*—†——*E. A.*—Your plant is Sálvia Gráhami.—†——*A Subscriber.*—We are not aware that the roots of any species of Nolana are edible. There is no doubt that seeds of Tropæ'olum canariense may be eaten in the same manner as those of the common Nastúrtium.—†——*Flora.*—Your plant is Cissus stans, now called Ampelopsis bipinnata.—†——*Emma.*—As soon as we can find room, we will give a list of such flowers as open and close at stated periods during the day.—‡——*A. Pontey's* bulbs are Phycella brevituba.——Will *Poluphloisbos* be so kind as inform us what form of ammonia he employed in his experiments?—†——*J. K.'s* excrescences upon Elm-leaves are the work probably of a genus of Aphides, called Eriosoma; but all the insects had escaped. We hope that he will transmit us some of the infested leaves at an earlier period next year, that the species may be determined. One of the most serviceable works for making out the British Lepidoptera from coloured figures, is "Wood's Index Entomologicus."—*R.*——*Mr. Butcher.*—Your Grape called the Champion is a very fine sample, but so like an extremely well-ripened and well-grown Black Hamburgh, that we do not perceive the difference.—†——*E. F.*—We cannot undertake to publish the weight and dimensions of fruit which has not been inspected by ourselves. If you wish your Potatoes and other productions to be registered, you must send them, carriage paid, to our office.——*An Original Subscriber* and *Mr. Henderson* are much thanked for their *evidences*, which will be used shortly, when the subject of transformations in plants is resumed.——*A Northern Subscriber.*—Your plants are, 1, Linária triphylla; 3, L. speciosa; 4, Stenactis speciosa; 5, some Labiate plant, but it is impossible to say what from so small a specimen; 6, a species of Physalis.—†——*Hortulanus.*—Your Erica is E. Sebana.—‡——*Clericus.*—Instead of a Pear, we have received from the Post-office 6 square pieces of mahogany, tied together with variegated worsted. As to the Pear, we fear it is to be sought for in the pocket of the guard.—†——*B.*—The Passion-flower seems to be Loudoni, but is in a very singularly monstrous state. We should like to see the unexpanded flowers not crushed by the Post-office.—†——*J. C. L.*—The cuttings were received safely by the Horticultural Society, and are much valued. An official acknowledgment would have been sent had your proper address been known.—†——*Liscard.*—Your Apples are, 1 and 2, Yellow Newtown Pippin; 3, Baldwin; 4, Boston Russet; 5, Æsopus Spitzemberg; 6, Alfriston (you may have obtained it, perhaps, by the name of Baltimore); 7, Pennock's Red; 8, Hawthornden; 9, probably Keswick Codlin; 10, Cat's-head; 14, Yorkshire Greening; 15, Beauty of Kent. *Pears*: 1, Grey Doyenné; 2, Aston Town; 3, Buchanan's Spring Beurré (not, however, melting, but a hard coarse Pear); 4, Uvedale's St. Germain; 5, White Doyenné.—‖——*J. D.*—One of your plants is Lycopódium Phlegmária. The other is Verbesina virgínica.—†——*W. R.*—Your *Pears* are, 1, White Doyenné; 3, Glout Morceau. The *Apples* are, 1, Yorkshire Greening; 2, Winter Pearmain; 3, French Crab; 4, Beauty of Kent; 5, Crimson Queening.—‖——*A Novice in Dahlias.*—Your seedling will never prove a first-rate variety; and, the season being far advanced, a satisfactory opinion cannot be given. As the flower is of a pleasing and desirable colour, it would be advisable to try it another season.—*——*B. B.*—Your *Pears* are, 1, Beurré Diel; 2, Urbaniste; 3, Napoleon; 4, Beurré Bosc; 5, Buchanan's Spring Beurré; 6, Brown Beurré.—‖——*A. B. C.*—You will find ample directions for the management of the Ranunculus at pp. 420 and 469 of this year's *Chronicle.*—‡——*Glowworm.*—As nearly as we can judge from such morsels, your plants are, Sámolus littoralis, and a variety of Alyssum marítimum.——*T. M.*—Your Apples are, 1, Longueville's Kernel; 2, Gloria Mundi—‖——*A. B.*—No. 1, Swan's Egg; 3, 4, Marie Louise; 5, Ne Plus Meuris; 6, Autumn Bergamot; 8, Louise Bonne (of Jersey); 10, Seckle; 11, Easter Beurré; 12, Beurré Bosc; 14, Glout Morceau; 15, Burgermeester; 17, Passe Colmar; 18, Uvedale's St. Germain. *Apples*: Nos. 1 and 3, Rymer; 2, Court-pendu Plat; 4, Dumelow's Seedling; 5, Nonesuch; 7, Downton.—‖——*H. H.*—Of your plants, No. 1 is Fumária capreolata; 2, F. officinalis.—‡——*E. F.*—Your trees are Taxódium distichum and Alnus glutinosa, var. quercifólia.—‡——*Herts.*—The Pear is Beurré de Capiaumont: the Apples are, 2, Carlisle Codlin; 4, Court-pendu Plat; 5, Hughes's Golden Pippin; 6, Wyken Pippin; 7, Pomme-roy. Your plants are, 1, Muráltia Heistéria; 2, Agératum conyzoides.—‖ †——*J. Davis.*—The Grapes are as sour as Verjuice.—†——*C. M.*—The Artemísia from Mount Vesuvius is A. campestris.—†——*J. M. W.*—It is not usual for the Double-blossomed Peach to produce fruit, especially as a standard. Having been budded on a tree against a wall, it produced fruit somewhat similar to that you sent, in the garden of the Horticultural Society, in the warm season of 1826.—‖—*Mr. O'Grady* next week.

Mr. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3*d.* each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5*s.* for every 25 copies.

As usual, many letters have arrived too late for answers this week.

Erratum.—In the article upon the Vitality of Seeds, at p. 526, column *a*, line from the top 13, read "hemp-bag" instead of "damp bag."

NEWS OF THE WEEK.

The news from Canada, announcing a complete change in the policy of the Government, and the admission of the French Canadians to a share in the Executive, is the most important feature in our political intelligence. The Governor-General has appointed to the highest offices of the state some of the most active leaders of the extreme party in opposition, who were so deeply implicated in the late insurrection, that large rewards were offered by Lord Seaton for their arrest. It appears that the growing power of this party rendered it extremely doubtful whether the Government could be carried on to the further exclusion of French interests, and that Sir Charles Bagot found it necessary to adopt a policy of conciliation, with the view not only of effecting a union between the French of Lower Canada and the moderate parties of the Upper province, but also of counteracting the mutual jealousies which had for years existed between the parties themselves. The Governor-General expresses his belief that this measure will effect a strong and united council, and secure the political tranquillity of the country. The Liberal party in the colony and the United States journals hail it with satisfaction as an act of justice, dictated by enlightened principles; while all the organs of the Loyalist party denounce the policy as a reward offered to rebellion, and contend that nothing but the recall of the Governor-General will satisfy the inhabitants of Upper Canada.—An alarming account of further disasters in Affghanistan, involving the destruction of the 41st Regiment, appeared in the *Standard* of last night; the rumour is officially contradicted by the ministerial papers of this morning, and happily there seems to be little doubt that the report is entirely without foundation. The details of the Indian news which we publish this week add little to the summary given in our last: the orders for the advance were issued on the receipt of the despatches which left England on the 5th of June; and it was expected that the troops would march from Candahar in the early part of August. The news from China gives the particulars of the capture of Chapoo, and mentions an intended attack upon Nankin. This movement was generally believed to be uncertain, and, from the advanced state of the season, it was considered unlikely that any further progress would be made this year.—In France, the rumour gains ground that M. Guizot intends to obviate the difficulties of the right of search, by proposing a new treaty for the suppression of the slave-trade, similar to that which Lord Ashburton has concluded with the United States. The subject is debated with much warmth, and supplies the journals with an abundant field for speculation on the future policy of the Ministry.

At home, the revenue accounts, which have been published this week, are the chief topic of interest. It had been generally expected that the large quantity of corn taken out of bond at a high duty, and the sum derived from the Income Tax on the Midsummer dividends, would have raised the revenue for the last quarter to a considerable extent. These expectations have not been realised; the accounts for the year present an increase of 355,981*l.*, but those for the quarter, as compared with the same quarter of last year, show a decrease of 67,473*l.*, although the Income Tax returns, amounting to 313,844*l.*, come into the calculation. The effects of the recent strike and of the distress in the manufacturing districts are painfully shown by the Excise returns, which exhibit a decrease on the quarter of no less than 434,831*l.*, being a diminution at the rate of 1,800,000*l.* per annum. Nothing that has yet been published has given a more significant proof of the destitution and sufferings of the labouring classes than these returns, or more clearly shown how seriously the public credit might be compromised by the continuance of such distress.

Home News.

Court.—Her Majesty and Prince Albert continue well, and remain at Windsor Castle. The Prince of Wales and the Princess Royal are also in excellent health. Prince Albert, during the week, has hunted with his beagles in the Great Park, and has shot over the preserves at Swinley Lodge. The Duchess of Kent has been indisposed, but has now recovered. His Royal Highness the Duke of Cambridge arrived at Cambridge House on Tuesday night from a visit to the Duke of Cleveland at Raby Castle, having previously visited the Bishop of Durham at Auckland Castle. His Royal Highness the Duke of Sussex and the Duchess of Inverness, after a lengthened visit to the Earl of Scarborough, have visited Upleatham, to honour the Earl and Countess of Zetland with their company. The Duchess of Gloucester has left Alnwick Castle, after passing a week with the Duke and Duchess of Northumberland, on her return to Ravensworth Castle. His Imperial Highness the Archduke Frederick of Austria, after a visit of several days to Sir Robert Peel, at Drayton Manor, proceeded to Chatsworth, to honour the Duke of Devonshire with a visit previously to his going to Wynyard Park. His Imperial Highness has been suffering from a cold caught while shooting, last week, but is now convalescent.—Lord Byron has succeeded Lord Rivers as the Lord in Waiting, the Countess of Dunmore has succeeded the Countess of Mount Edgcumbe as the Lady in Waiting, and the Hon. Gen. Sir Wm. Lumley has succeeded Capt. Duncombe as the Groom in Waiting on her Majesty.

The Revenue.—The abstract of the net revenue for the year and quarter ended on the 10th inst. has just been published. The revenue for the year, as compared with the year ended October 10th, 1841, shows an increase of 355,981*l.* The revenue for the quarter, as compared with the corresponding quarter of last year, shows a decrease of 67,473*l.* The receipts for the year exhibit a return of 313,844*l.* under the head of Property Tax; in the Customs there is an increase of 171,278*l.*; in the Post-office, of 165,000; in Miscellaneous of 477,803*l.*, to which must be added the Imprest and other Moneys 70,014*l.*, Repayments of Advances 104,435*l.*; making a total of 1,302,374*l.* In the Excise there is a decrease of 733,448*l.*, in the Stamps of 139,712*l.*, in the Taxes of 62,233*l.*, and in the Crown Lands of 11,000*l.*; making a total of 946,393*l.*, which being deducted from the increase of 1,302,374*l.*, leaves a total increase on the *year* of 355,981*l.*, as above. The receipts for the quarter give a a decrease in the Excise of 434,831*l.*, in the Stamps of 101,224*l.*, in the Taxes of 142,733*l.*, in the Crown Lands of 38,000*l.*; making a total of 716,778*l.* In the Customs there is an increase of 206,760*l.*, in the Post-office of 52,000*l.*, in Miscellaneous of 5,999*l.*, to which must be added Imprest and other Moneys 13,265*l.*, Repayments of Advances 57,837*l.*, Income Tax 313,844*l.*; making a total of 649,305*l.*, which, deducted from the decrease of 716,778*l.*, leaves a total decrease on the *quarter* of 67,473*l.*, as stated above. It will be seen from this statement that the falling off in the Excise during the past quarter amounts to no less than 434,831*l.*, and that, had it not been for the Income Tax, which enters into the calculation for the quarter, the increase on the year would have been only 42,137*l.*, while the deficiency on the quarter would have amounted to the sum of 381,317*l.*

Church Preferment.—The *Gazette* of Tuesday announces that the Queen has been pleased to appoint the Rev. Thomas Turton, D.D., to be Dean of Westminster, void by the death of Dr. Ireland.—It is understood that the Rev. Dr. Butler will be appointed to the deanery of Peterborough, vacated by the nomination of Dr. Turton to that of Westminster. Dr. Butler was for several years the head master of Harrow School.—The Rev. C. Lawson, morning preacher at the Foundling Hospital, has been appointed Archdeacon of Barbadoes.

The Colonies.—The *Gazette* of Friday sets forth that the Queen has been pleased to constitute the church of the Holy Trinity, in the town of Gibraltar, to be a cathedral church and bishop's see; and to ordain that the whole town of Gibraltar shall henceforth be a city, and be called "the City of Gibraltar." The church of St. David in Hobart Town is in like terms similarly ennobled. The *Gazette* also contains an Order in Council, appointing Wellington, Auckland, and Russell, in the colony of New Zealand, to be free ports, according to the regulations of an Act of Parliament entitled "An Act to regulate the Trade of the British Possessions abroad."

Foreign.

France.—The Paris papers are still destitute of political news. The only novelty is the rumour that M. Guizot has undertaken to avoid the difficulties of the right-of-search treaty, by preparing altogether a new treaty, in which France engages to exert herself energetically to repress the slave-trade. The existing engagements with England are to be revoked according to this account, and the whole question put upon a footing more in accordance with the views of the Opposition in the French Chambers. The search of the Aigle, by the Cygnet, continues to be the subject of discussion with the French press, and the writers still talk of the French flag being insulted by the visit of British officers not dressed in full uniform. The King of the Belgians arrived in Paris on Sunday, for the purpose of promoting the conclusion of a commercial treaty between France and Belgium.

The Capital.—On Monday last, being the anniversary of the *fête* of Queen Isabella II., the ex-Queen Christina repaired from Malmaison to Paris, and held a levee, at which her Majesty received the congratulations of the Spaniards attached to her party, now residing in the French capital.—The papers announce that the Prince de Joinville and the Duke d'Aumale left St. Cloud on the 8th inst. for Brest, where they were to embark for Gibraltar and Algiers. According to the same journals, a grand review of the garrison of Paris is shortly to be held by the Duke de Nemours and King Leopold.—It appears that extreme distress presses at this moment on the trading classes of Paris, and that during the first eight days of the present month more than 60 sales under decrees issued from the courts of law had taken place among the commercial classes.

The Railroads.—The Scientific Commission appointed by Government to report on the causes of the accident of the 8th May on the Paris and Versailles railway (left bank) have sent in their report. The members of the Commission are M. Lebas, the engineer, and Messrs. Cave and Facrot, manufacturers of steam-engines. It appears from the report—1, that the accident of May 8 cannot be attributed to any of the causes stated at the first moment; 2, that the employment of a locomotive with two axletrees (four wheels) had no influence whatever upon the accident; 3, that the fracture of the two axletrees of this engine was not owing to the bad quality of the iron, nor to any decomposition or displacement of its molecules caused by age or the nature of its service, but was caused by a shock of such violence that nothing could have resisted it; 4, that the employment of two locomotives of unequal power—the weakest preceding the strongest—so far from having aggravated the consequences of the accident, tended, on the contrary, to lessen them as much as possible.

French Custom-house.—Several accounts have lately been published respecting the vexatious annoyances to which travellers have been subjected by the system of personal search at the French frontier stations. Every traveller who has entered France from the Swiss frontier must have had some experience of this system, which has latterly been carried to a great extent in all the ports and stations of the kingdom. It appears, however, that the Court of Police of Sarreguemines, on the Prussian frontier, has declared that the search of the persons of travellers practised by the Custom-house officers is illegal. The Court, in giving judgment, dwells with much emphasis on the indignities inflicted on female travellers by the Custom-house authorities. The Paris papers, in giving this judgment, are almost unanimous in condemning the practice as a pretension quite unparalleled in other countries of Europe, and as one of the chief means of keeping travellers from the French ports.

Spain.—The official decree of the Regent, convoking the Cortes for the 14th of November, has just been published. It is believed that the session will be opened without a speech from the Regent, in order to avoid a debate on the address, and that the Ministry at the commencement of the session will call the attention of the Cortes to the budget, which is now nearly prepared, and lay before them a number of bills prepared during the recess. The papers contain no news of interest beyond these announcements, and the statement that the draft of an amnesty, prepared by S. Zumalacarreguy, has been rejected, on the ground that it was too comprehensive. It proposed that 25 persons only should remain expatriated, to which the rest of the cabinet would not agree, and the question is therefore indefinitely adjourned.

Portugal.—We have accounts from Lisbon to the 3d inst. They have little interest for the English reader. An insurrectionary movement had occurred at Marvao, but it does not appear that it was connected with any general conspiracy, though attempts were making to promote discontent among the working classes by the opponents of a reduction in the tariff and the opposition press. The financial crisis had been nearly passed, and on the 1st, Baron Fayal had completed the payment of 102,500*l.* to the British Government, being 40,000*l.* for claims falling due the 1st of September, 50,000*l.* falling due the 1st of October, and 12,000*l.* instalment of the claims decided by the London mixed commission. The tariff convention had made no definitive progress, but the new Foreign Minister appeared to be actuated by a desire to bring it speedily to a close, and the Portuguese Commissioners, under his directions, were active in the discharge of their labours. The basis originally proposed by Portugal was to be generally adhered to.

Germany.—Letters from Berlin of the 3d inst. mention the return of the King and Queen of Prussia from their visit to Neufchâtel. The marriage of the Princess Mary, daughter of Prince William of Prussia, to the Crown Prince of Bavaria, was solemnised on the 5th. The marriage took place by proxy, his Royal Highness the Prince of Prussia representing the bridegroom. The marriage at Munich, according to the rites of the Catholic church, was to take place on Wednesday last. The Rev. Messrs. Sydow and Von Gerlach, who have visited England to make themselves acquainted with the nature and ordinance of the English Episcopal Church, are said to be convinced that the German Protestant Church cannot be united with it. A law-suit has just been decided by the supreme tribunal at Berlin, after having actually been litigated for nearly 300 years, by the two noble houses of Aremberg and Manderscheid. The quarrel originated in a marriage contract, and, in the course of the litigation, among the witnesses, there appeared no less a person than Count Egmont, who was executed at Brussels in 1568. The suit has been now decided in favour of the house of Aremberg.—A metrical translation of Pope's Works has recently, and for the first time, been presented to the German public. It is the joint production of Adolph Bœttger and Theodor Oelkers; the former the successful translator of Byron, the latter of Moore.—The accounts from Leipsic respecting the commencement of the Michaelmas fair are, on the whole, favourable. Very large wholesale purchases have been made. It is remarked, that among the numerous strangers there are many Armenians and Austrian Jews, and also numbers of Russians and Poles.—A letter from Dresden, of the 3d instant, announces the arrival there of Lord Wilton as Envoy Extraordinary, Mr. Mellish as his secretary, Lord Charles Wellesley, Sir Charles Young, Garter King at Arms, and Mr. Pulman, the Herald, commissioned by the Queen of England to invest his Majesty the King of Saxony with the insignia of the Order of the Garter.—A Hamburgh paper mentions, that some days ago, when the rubbish was cleared away in some places for the purpose of commencing the erection of new houses, the flames burst forth on several points, although nearly five months had elapsed since the great fire.—The Austrian Government has issued an order relative to the employment of children in manufactories. No children are to work younger than nine years old, and not then, unless they have been three years frequenting school, and receiving religious instruction. From nine to twelve years, children must not work above ten hours; from twelve to sixteen, children must not work above twelve hours, with one hour's interval. No boy or girl under sixteen to work at night.—A museum is to be erected at Trieste, as a monument to the memory of Winckelmann, who was murdered there in 1768 by an Italian of the name of Arcangeli. The museum, which will contain chiefly remains of the antiquities of Trieste and its environs, is to be opened on the 8th June, 1843.—The negotiations of England with the Austrian and other German governments for the transit of the overland India mails by way of Trieste, &c., are, it is said, nearly concluded, and an English courier with the mail has either already taken or will very shortly take this route.

Holland.—The festivities in honour of the marriage of the Princess Sophia, daughter of the King of Holland, to the Hereditary Duke of Saxe Weimar, which was solemnised on the 8th instant, are the chief topics in the Dutch papers. The magistrates of the Hague ordered the town to be illuminated; and the rejoicings at Leyden were on an extensive scale. The government papers are filled with appointments and promotions made by his Majesty in honour of the event.

Switzerland.—Letters from Neufchâtel give accounts of the festivities in honour of the King and Queen of Prussia. Their Majesties were received at Landeron by General Pfuel and Baron Chambrier, and their progress thence to the Castle resembled a triumphal march. The King, attired in the uniform of the Swiss arquebusiers, was met at the gate of honour by the Burgmaster, to whose address he replied in most benevolent terms. In the evening the whole city was illuminated. The ultra-radicals in the Val de Travers manifested their hostility by pulling down the triumphal arches erected in honour of his Majesty; but the King was not deterred by this act of disrespect from pursuing the liberal course which he had adopted at Cologne towards his Rhenish subjects.

Russia.—The German papers received this week contain long accounts of the melancholy shipwreck of the Russian line-of-battle ship Ingermannland, which we recently noticed. It appears that the number of those who were lost was not exaggerated, and that 453 are now known to have perished. The commander, Capt. Terschin, thought of nothing but his own personal safety, and he, who should have been the last man to leave the ship, escaped in one of the boats, leaving the rest of the unfortunate crew to their fate. The other particulars differ in no important point from those already published. The wreck is still drifting about, to the great danger of vessels navigating the North Sea.—The news from Circassia and Daghestan continues to be unfavourable to the Russian arms. In the former, the insurgents had gained fresh advantages over the invaders, and possessed themselves of several forts situate along the coast of the Black Sea.—The Russian Government, it is understood, intend to begin the works of the Moscow railway in the spring, which are to be principally executed by the soldiery. The line is estimated to cost 6,400*l.* per mile. They have authorised the house of Stieglitz and Co. to negotiate a loan of fifty millions of silver rubles, to be employed in its construction. Only eight millions are to be taken up in the first instance to meet the expenses of 1843.—Further particulars of the destruction of Kasan have been received. They state that two fires, which occurred in the latter end of August, were merely the precursors of the dreadful catastrophe which befel this city on the 5th September. At 10 o'clock on the morning of that day the fire was first seen issuing from the Town-house. The wind being high at the time, the flames spread quickly through the town. In the course of twelve hours, 1,309 houses, 9 churches, and one convent, had fallen a prey to the fire. The very pavement of the streets, being of wood, becoming ignited, all access became impracticable. Of the vast magazines filled with merchandise, but four warehouses were saved. The scientific establishments suffered considerably. The Observatory is but a heap of ashes, and it was with difficulty that the astronomical instruments were preserved. On the morning of the 6th the half of this flourishing city was consumed; nor was this the conclusion, for on the same afternoon the flames burst out afresh. On the 7th and 8th the fire again appeared in certain quarters. There appears no doubt that the calamity was the work of an incendiary. The damage is estimated at 15,000,000 rubles banco, of which 860,000 silver rubles are insured.

ITALY.—Letters from Rome of the 23d ult. mention the Pope's return, on the preceding day, from Civita Vecchia, where his holiness had spent some days for the benefit of the sea air. His return had been somewhat accelerated by the illness of the friend of his youth, Monsignor Traversi, Patriarch of Constantinople, who died the day before the Pope's return to Rome. The same letters speak of devastations occasioned by the deluges of rain that had fallen in different parts of Italy. Near Faenza almost the entire district had been under water, and the destruction of property was incalculable. Numbers of houses have been washed away, and within the city itself no less than eighteen had fallen in. The beautiful old Roman bridge, of three arches, after having braved the destructive power of time for so many centuries, had been completely destroyed. In Ravenna the inundation occurred during the time of the fair, when the floods that entered the market-place swept away booths and merchandise, besides drowning a great number of people.—The new penal code and code of criminal procedure, which, by order of the Pope, have been drawn up by a committee composed of the most eminent legists in Italy, presided over by Cardinal Bernetti, have just been published. These two codes are a real work of improvement, and bear the mark of an enlightened philanthropy. By them all the privileges and exemptions hitherto enjoyed by the higher classes are abolished. They establish the perfect equality of all citizens before the law, that no person can be withdrawn from his natural judges. They maintain no exceptional tribunals except the ecclesiastical ones, and those only for persons in orders, and for crimes and misdemeanours committed in the exercise of their functions. The punishment of death is preserved, but restricted to a very small number of crimes. All other punishments evidently have for their object the amendment of the individuals on whom they are inflicted. As to foreigners, the enactments which relate to them are exceedingly liberal. After a delay of two months together in any part of the Pontifical States, they are no longer to be amenable in criminal matters to the police authorities, but to the ordinary tribunals, and in all cases in which they shall be found guilty of misdemeanours or slight offences with extenuating circumstances, they are to be condemned to the smallest amount of punishment.

TURKEY.—Letters from Constantinople to the 21st ult. state that the fall of Izzet Pacha has produced little change. Sarim, who still remains Reis Effendi, persists in thwarting the representatives of the Five Powers. He proposes to grant the Maronites liberty to assemble deputies to discuss their affairs, and to put two Turkish chiefs over the Druses and Maronites, both to be subject to the control of a Pacha. A considerable movement of troops has taken place from Constantinople to the northern provinces of the Turkish empire; and it is reported that the provinces of Bulgaria and Albania are in a state bordering on revolt.—Accounts from Servia mention that an opposition against the new order of things in that province had been already organised, although the Government had established a system of terror in order to stifle resistance. Every day arrests are made amongst the most distinguished families. Amongst others, the two sons of the senator Mileta, who possesses considerable influence, had been imprisoned. The Opposition is said to be gaining strength, and a counter-revolution in behalf of Prince Michael is talked of.

EGYPT.—Letters from Alexandria of the 21st ult. mention the arrival of Dr. Lepsius with the Prussian commission for the investigation of the remains of Coptic arts and languages in Egypt. Dr. Lepsius is also charged with the presentation to his Highness of some vases, sent by the King of Prussia. There is no political news, the Pacha having been for several days past on board the Egyptian fleet, still cruising off the port.

INDIA.—The following are the details of the Indian news, of which we gave a summary in our last. The decision taken by the Governor-General to send forward the troops from Candahar and Jellalabad to Cabul, appears to have been adopted immediately on the receipt of despatches which reached India by the mail that left England on 5th of June. The Candahar army having on the 30th of June received the welcome notice for a movement, was ordered to form into two divisions: the one under General England to proceed towards Quetta, and the other under General Nott to move to the northward. The force at Candahar, under General Nott, was so well furnished with carriage cattle as to be able in July to move in any direction. The spirit of those troops may be learned from the following anecdote:—When that General was told that he should evacuate Affghanistan, he is said to have inquired "by which route, whether by Quetta backwards, or to Cabul forwards?" The abandonment of Candahar seems to be decided on, for a general destruction of guns, ammunition, and small arms, which could not be conveniently removed, was stated to have taken place. Among other arrangements, the distribution of warm clothing to the Bengal troops was not neglected. It was expected that the troops would march from Candahar on the 8th, 9th, or 10th of August, and it was asserted that Akhbar Khan, whose great object was delay, had sent another of his prisoners, Captain Lawrence, to Jellalabad, to try to make further arrangements. The removal of the troops from Jellalabad appeared to be necessary, as sickness prevailed, and several officers had died there since the arrival of General Pollock. Every preparation was making at the period of the latest intelligence for a speedy movement. The force at Jellalabad was then considerable, for besides the "illustrious" garrison, which had, under General Sale, withstood the siege of Akhbar Khan, and the troops that stormed the Khyber Pass, under General Pollock, a considerable body of Sikhs, against whose behaviour as auxiliaries no great complaint was urged, was collected there, and to whose custody it was said that the fortress of Jellalabad and the care of the Khyber Pass were to be intrusted after the retirement of the British. The papers publish some interesting extracts from letters received from the prisoners. They state that Lady Sale had written two very interesting letters while the prisoners were at Lughnan. The first was written in very good spirits, just after receiving clothes, &c., from Jellalabad. "They had not changed," she said, "since they left Cabul, and there was such a scramble for them, some (the weakest) get none, which, when she heard, she had them divided more equally. They were living twelve in one room—herself and Mrs. Sturt (who was expecting to be confined), Mrs. Trevor and her five children, and Ayahs; and poor Capt. Mein, who lay at the foot of their bed, was so frostbitten he could not move." But the most interesting anecdote she tells was, "that they picked up a Bible and a Prayer-book on their road from Cabul, and in this poor Mein reads the lessons, &c., to them every evening; but the evenings were so long and dreary, they wanted candles more than anything." Her last letter was very desponding, as they were going to be removed behind mounted horsemen, they knew not whither, but not very far off; and that Akhbar Khan was willing to treat. Lady Sale says, if she escapes she will publish everything, as she has taken notes of the whole proceedings; but there are painful tales already hinted at—of officers following their wives, instead of remaining at their posts.—A letter from another prisoner says—"The Sirdar's treatment of us has been, from first to last, most kind: no European Power could have treated prisoners of war better. There is a feeling abroad that we have been ill-treated, but it is very erroneous, and Akhbar has enough to answer for without this being added to his sins. The conduct of all the ladies is beyond praise, and such as to make every Englishman prouder still of his countrywomen. Lady Sale and Mrs. Sturt continue to afford examples of magnanimity and patient suffering to those of weaker mould."—A letter dated Cabul, July 5, 1842, says—"Our situation is the most tantalising you can imagine. We are completely in the dark as to the objects of our Government, and as to whether our troops are coming up to Cabul, or not. A short time ago they would have had nothing to do but to take possession of the whole country without a shot being fired, and even now I am convinced they might come up without seeing an enemy. The whole people, and especially the inhabitants of Cabul, are in the greatest dread of the punishment which they expect awaits them." These letters mention that two of the officers, Drs. Campbell and Bryce, who have been long reckoned among those who had fallen, are alive. The former is safe at Cabul with the hostages, and Dr. Bryce is with the other prisoners in the hills. So great is the alarm of the Affghans, that they were begging written notes and little bits of scribbled paper from the prisoners to serve as tokens for their preservation. It appeared to be expected in well-informed quarters that little or no opposition would be made to the advance of the troops. All these statements, coupled with the facts that have occurred since the disastrous retreat of January, are considered in India to prove that the fatalities of last year were owing more to the want of talent and energy on the part of the British leaders than to the enterprise or patriotism of the Affghans. Captain Troup had declared "that no doubt exists, if a single wing of a regiment had marched into Cabul on the 2d of November, the much-talked-of insurrection would have been completely and effectually put down."—Since the above was in type, a rumour of further disasters has been circulated, occasioned by the subjoined paragraph from a letter said to have been written by Major Messiter, which appeared in the *Standard* of last night:—"With pain, but without hesitation, we lay before our readers the following extract from a hurried letter written on the 27th of Aug. at Bombay, by Major Messiter, of the 28th Regiment:—'Bombay, August 27, 1842. * * * The Colonel is going away in command of a brigade. I therefore fall into the command of the regiment. We take the field immediately. Most disastrous news [have] arrived [from] the interior. The 41st cut to pieces. [A reference to some private affairs follows.] Yours, &c., J. MESSITER." Fortunately this alarming intelligence has been contradicted by the Ministerial papers of this morning, and the "Standard" itself has shown its inconsistency with the facts received from official sources. The "Times" states that "An official letter from the highest authority in Bombay, dated August 28, and professing to give '*the latest news*' from Candahar, makes no mention of such an occurrence, and from the perfect silence of the Indian press upon the subject, it would seem to be rather an individual fiction than even a current rumour. Its extreme improbability has been ably exposed by our contemporary, and we need only now call attention to the circumstance that Major Messiter professes to be acting upon orders issued on the receipt of intelligence of which those from whom alone the orders could have emanated know nothing. We trust that all future reports of disasters in Affghanistan may admit of such easy refutation."

CHINA.—The news from China is to the 7th of June. It contains the account of the capture of Chapoo on the 18th May, which was effected without loss to the British; but when the troops were moving through the town, violent resistance was made from a Joss-house, into which 300 Tartar soldiers had retreated, who, fearing that if they surrendered they would be cut to pieces, unexpectedly fired on some British companies. Colonel Tomlinson of the 18th Royal Irish, was killed, and Colonel Mountain, and Capt. Campbell, and Lieut. Jodrell wounded. The Tartars defended themselves most desperately; and it was not until the house fell upon them that about 40 were taken; the rest perished. It was reported that 15,000 China troops had landed on the Island of Chusan, which has been virtually abandoned by our Government, and that a great many war junks were in readiness. On the 18th May, great numbers of fire-ships were sent down among the shipping, with two and three chained together; but with the assistance of the French frigate Erigone, the seamen succeeded in towing them clear. The Cambrian frigate arrived on the same day; Capt. Chads immediately sent all his boats round the island, and burnt the brushwood piled up in enormous heaps alongshore in readiness for other fire-ships. An apprehension prevailed that but little would be effected this year, in consequence of the delays that had taken place. The want of vigour in the prosecution of the war was much spoken of, particularly as the season for sailing along the coast, without danger, was allowed to pass over. The expedition was, however, said to be preparing to attack Nankin, the southern capital. Since the arrival of the mail a report has gained currency in political circles, that overtures have been made by an influential party in China to the British authorities in that country, the objects of which are to depose the Emperor, to establish another form of government, and to enter, should the revolution succeed, into terms of amity with Great Britain, both political and commercial.

UNITED STATES.—The Great Western steamer from New York arrived in Kingsroad on Wednesday night, after a passage of 13 days. Throughout the passage they had contrary winds and bad weather, and during five days they could not see the sun. The Great Western left New York on the 29th September, and brings papers to that date. Lord Morpeth is a passenger by her; he is in excellent health, and is said to be highly gratified by his visit to the United States. The contest for the Presidency was already beginning to excite the public mind. Mr. Clay was spoken of by the Whig party, and has published a letter containing his sentiments on the public policy of the American Government. The points on which he insists as essential to the administration are:—"A sound national currency, regulated by the will and authority of the nation; an adequate revenue, with fair protection to American industry; just restraints on the Executive Power, embracing a further restriction on the exercise of the veto; a faithful administration of the public domains, with an equitable distribution of the proceeds of sales of it among all the States; an honest and economical administration of the general Government, leaving public officers perfect freedom of thought, and of the right of suffrage; but with suitable restraints against improper interference in elections; and an amendment of the Constitution, limiting the incumbent of the presidential office to a single term." The opposition party is said to be divided between the merits of Mr. Van Buren and Mr. Tyler. The Ashburton treaty appears to have given considerable satisfaction, but beyond this there is no news of importance from the United States.

CANADA.—The news from Canada is of great importance. Sir Charles Bagot has made an almost entire change in the members of the executive government. The extreme liberal party, and those particularly who have been distinguished as leaders of the French Canadians, have been admitted to a share in the executive: Mr. Lafontaine, who took an active part in the late insurrection, and for whose arrest in 1837 a reward was offered by Lord Seaton, has been appointed Attorney-General for the east, and Mr. Baldwin, the leader of the reformers, has been appointed to the same office for the west district. These offices give a seat at the Council Board of the Governor. Other employments and seats at the Council Board have been bestowed on Messrs Girouard (also compromised in the insurrection of 1837, and for whose apprehension Lord Seaton offered a reward of 500*l.*), Mr. Morin, and Mr. Papin. In this way a complete fusion of parties and interests has been brought about, and it is anticipated by those who regard this compromise as a wise and liberal policy, that the Canadas, now united under one government, will henceforth be more peaceable and more prosperous. On the other hand, the Loyalist party condemn the change, as a humiliating concession to the Opposition, and talk of the recall of the Governor-General. The *To-*

ronto Patriot says .—"On no former occasion do we recollect witnessing so strong an expression of intense sorrow and humiliation as has been exhibited by every one with whom we have conversed on the occasion of this abject surrender of the happiness, hopes, and prosperity of the people of this rising colony into the hands of a merciless and grasping faction." The *Rochester Democrat* shows that the dissatisfaction with the late appointments by the Governor has extended to the Parliament of Canada. "The Governor-General," it says, "in trying to administer the government upon 'conciliation principles,' is likely to find himself entirely unsupported. By calling into his cabinet men of liberal principles, he has offended the Tories and a portion of the so-called Reformers, who together command a majority in Parliament. Mr. Draper, one of the highest officers of Government, has resigned, and it is expected that there will be a general break-up of the cabinet. It is also rumoured that Parliament will be dissolved. If so, there will be another general election, which will be attended with unusual excitement." The United States papers, on the contrary, hail the change with satisfaction; one of them says:—"If England has come to a determination not longer to possess a colony than she can make it evidently the interest of the colony to remain such, and so much the interest that the inferiority implied in the relation of a colony is forgotten, then the policy now pursued is natural, and affords another proof of the superior lights which have broken in upon the statesmen of the present day." Another says:—"The fact that such men are now placed in the Canadian councils—the very powers nearest the Throne, looks well for the extension of liberal principles, under which alone governments can flourish on this continent in these enlightened days."

Mexico.—Intelligence has been received by the Great Western, that the Mexican expedition to Yucatan had been completely successful, the Yucatans having capitulated without firing a gun. This is the result of the expedition alluded to in the last arrivals from Mexico. The Mexican force soon after arriving at Yucatan was joined by the Guadaloupe iron steamer, which lately sailed from this country, where she was built for the Mexican Government. These advices state that the murderers of the English artist, Mr. Egerton and his wife, whose melancholy fate was noticed in this Paper some months since, have been, it is thought, discovered, and are now in prison, undergoing their examination. If the persons arrested are really the murderers, the perpetrators of the deed are natives, and not foreigners, as was generally supposed at first.

West Indies.—The Royal Mail steamer Tay arrived at Falmouth on Wednesday from the West Indies, having left Jamaica Sept. 9, St. Jago 10th, Cape Haytien 12th, Turk's Island 13th, Nassau 17th, Bermuda 25th, and Fayal Oct. 5. The Solway steamer brought the Mexican mails to Nassau, and on the passage experienced a very severe hurricane, eighty miles west of Havannah. A violent hurricane had also been experienced at Havannah, on the 4th and 5th September, which destroyed upwards of twenty small vessels there, and three at Matanzas, one with 2,500 boxes of sugar on board. The fever had diminished at Havannah, and vegetables were very scarce in consequence of the hurricane. The House of Assembly at Jamaica was expected to meet the first week in October. Three shocks of earthquake had lately been felt in the island. The other news is unimportant.

CITY.

Money Market, Friday.—The dividends being now in course of payment, money has become still more abundant, and Consols are a shade higher, being now quoted 93½ to ⅝ buyers for the November account, and 93¼ to ⅜ for Money: Bank Stock, 165 to 6 ex. div.; Three per Cents. Reduced, 92⅜ to ⅝ ex. div.; Three and a Half per Cents. Reduced, 100¼ to ½, ex. div.; New Three and a Half Per Cents., 101 to ⅛; India Stock, 250 to 25½. Exchequer Bills are again higher, being 55s. to 57s. prem.

Metropolis and its Vicinity.

Charge of the Bishop of London.—On Monday the Bishop commenced the triennial visitation of his diocese in St. Paul's Cathedral. Full cathedral service was performed, the sermon on Monday being preached by the Rev. T. Dale, vicar of St. Bride's. At the conclusion of the sermon, the Bishop proceeded to deliver his charge. After an allusion to the divided state of the Church, to the evils likely to result from the numerous controversies of the day, and to the duties of the clergy in attending to the spiritual instruction of the people, the Bishop directed attention to the Articles of the Church. He was ready to admit that in some cases the words of a few of them were capable of bearing senses attempted of late to be fixed on them, but they were by no means consonant with the design of those who framed them, or with the spirit of the Church. He did not think that circumstances justified any persons in forcing any interpretation of an article on the Church which was not warranted by its plain, literal, and grammatical sense. He advocated a strict adherence to these Articles on the part of the clergy, because that would prove a check to much waywardness, and would protect the Church from the innovations of some of her injudicious members. The Bishop then directed attention to the doctrine of regeneration by baptism, which he contended was beyond all doubt the doctrine of the Anglican Church. It is freely and fully set forth in the 27th Article and the offices of baptism. He could not understand how any clergyman could deny this fundamental doctrine of the Christian faith, who had declared his conviction of the truth of the Prayer-book; much less could he conceive that any clergyman could justify himself in altering or omitting that part of the baptismal services when tempted by caprice to do so. He knew the practice prevailed extensively, and he deeply regretted it. The Bishop afterwards remarked on the doctrine of justification, and then called the attention of his clergy to the performance of Divine Service. What the Articles are with respect to doctrine, the rubric and the canons are with respect to discipline. A great degree of laxity has of late years crept into the church; for the removal of much of which we are indebted to those pious and learned men who have recommended a strict discipline, but who, in some cases, had gone beyond the line in attaching importance to things in themselves non-essential. Those persons were much to be condemned who overlooked the good that had been effected by these divines, while they regarded, exclusively, the evil. The observance of the rubric ought to be complete. Every clergyman was bound by his ordination vows to obey it, and he who now slighted it must be considered guilty of no ordinary crime. If he found he could not conform to them, the more honourable plan would be to withdraw from the ministry. Several of the clergy had lately observed saints' days, and others appointed by the church to be kept holy, and this had been designated a Popish custom. He did not think thus. He should offer no obstacle or objection to such observances. The days commemorative of the leading events in the Saviour's life, the Epiphany, the Ascension-day, Ash-Wednesday, and some others, ought to be observed by every clergyman. He approved also of daily service, and of the more frequent celebration of the communion. In regard to the dress of the clergy, he thought that the more simple the difference between the dress of the clergy and the laity, on ordinary occasions, the more desirable it would be, and the less likely to expose the former to ridicule. In regard to worshipping towards the east, the bishop said that it was an ancient practice, being alluded to by Clement of Alexandria, Tertullian, and others. He would not have the clergyman, when reading, to turn his back upon the people. He approved of the manner of constructing the reading-desk, which may be seen in some of our churches, which enables the clergyman to turn to the south while praying, and to the east during the lessons. He did not object to candles being placed on the altar during divine service, if they were only allowed to burn when the church or chapel was lighted up. It had been recently debated whether a clergyman should preach in his surplice or in his academical gown. He thought that when there was only one officiating clergyman, it was much better for him to ascend the pulpit immediately after leaving the communion-table, and thus preach in his surplice. The gown was probably first worn by lecturers when there was no communion service. On the whole, he thought it would be wise if the clergy would preach in their surplices in the morning, and in their gowns in the afternoon. The Bishop took occasion to thank the clergy for their kindness in co-operating with him for the foundation of the Colonial Bishoprics. The subscriptions in obedience to his call amounted to upwards of 8,000*l.*, much more than he had anticipated. He intended making another call on behalf of the metropolis church building fund. Forty-two new churches will be built from the funds already at his disposal. In concluding his charge, the Bishop remarked that he hoped the clergy would bear in mind that religion did not consist in externals and ceremonial observances; that they were valuable only as tending to cherish the spiritual affections excited. While contending for the faith once delivered to the saints, they should not forget charity, and should endeavour to be of one heart and one mind.

New Zealand Company.—On Monday a special general court of proprietors of the New Zealand Company was held for the purpose of declaring a dividend on the Company's stock, Mr. Aglionby, M.P., in the chair. It appeared from the report that a diminution in the sales of the Company's land had arisen during the last few months, owing to the depressed state of the shipping, commercial, and manufacturing interests of the country. The transactions of the Company were of a nature that rendered the payment of an equable dividend at all times uncertain; and the necessary expenditure in carrying out the plans of colonisation in the various settlements would frequently absorb a large portion, or even the whole derivable income from the sale of land. During the last four months, whilst emigration to Australia had been almost entirely suspended, it had been carried on without interruption, and on a large scale, to New Zealand; and the latest accounts from the Company's settlements represent them as eminently flourishing. Arrangements had been recently made with her Majesty's Colonial Government, by which 100,000 acres of land had been added to the Company's possessions. The report concluded by recommending a dividend of 2½ per cent. on the half-year ending the 1st inst., being at the rate of five per cent. per annum. Mr. J. H. Lance moved that a dividend be declared in conformity with the above recommendation. He was of opinion that a dividend of ten per cent. ought never to have been made. He had hesitated to become a member of this body in consequence of that large dividend, which appeared to place the Company on a level with those bubble associations which arose 15 or 16 years since, giving for the first two or three half-years a handsome dividend, and perhaps a large bonus to the directors; but shortly afterwards it was found that neither principal nor company was in existence. The resolution was carried unanimously; after which, the chairman thanked the proprietors for the unanimity they had shown in agreeing to the recommendation of the directors. It was infinitely more to the advantage of the Company that the proprietors should be content with a moderate return, than to draw a large dividend out of the general funds more immediately applicable to purposes of emigration. He must take his share of blame, in common with the other directors, in having previously recommended ten per cent. The funds at the present moment were in such a state, that they might have made a much larger dividend, or even have continued the former one; but the directors felt that it would be more prudent and wise to recommend that which had been adopted. Since May the Company had continued to pour a flood of emigration into the colony, both of labourers and capitalists. He had no doubt that when activity should recommence in the money market, attention would be turned to the colonies, in all of which he felt the deepest interest on public grounds. Most satisfactory intelligence had been received from Nelson, the Company's youngest settlement, not only from private channels, but from Captain Wakefield, which showed that it would prove a prosperous sister colony to Wellington and New Plymouth. Since the formation of these colonies no less than 8,473 persons had been sent, he trusted, to a happy and prosperous home, through the medium of this company. One circumstance that tended greatly to the prosperity of Nelson was, the fact that both coal and limestone had been found in its immediate neighbourhood in large quantities, and the former of the finest quality: one consequence of which would be the immediate establishment of steam navigation. Mr. Watson inquired what land the Company possessed in the district of Taranake beyond that already disposed of? The Chairman stated that the Plymouth board had now merged into the New Zealand Company, and since the union 50,000 acres had been taken in that locality. Mr. Watson said that he represented one-tenth of the population of New Plymouth in that district, all of whom were satisfied with the settlement, nothing being wanted but a port, in the necessity for which Captain Liardet agreed, as at present no vessel could trade with that district without a ruinous expense for insurance. The Chairman said that the directors were fully sensible of the desirableness of the proposed harbour, but the Company had already expended considerably more than the amount of the land sales upon that settlement. Moorings had been recently laid down, which were found of great service. The directors were most anxious to form the proposed harbour, but at present the funds were only sufficient for the more important purpose of emigration.

Custom House.—A letter has been addressed to the daily papers by Mr. J. Hastings, whose name has for some time past been mentioned in connexion with the recent transactions at the Custom House, denying that he participated in any degree in the frauds which have been brought to light, and stating that he has hitherto abstained from replying to the statements publicly made against his official character, as the whole particulars will shortly appear before the public in the course of legal proceedings in a court of justice. A rumour was current in the City last week, of some teas having been found to have travelled out of their proper course, in the transit from their place of deposit to a place of shipment in bond; and of their being, in consequence, put under seizure. A general feeling prevails in commercial circles that an official statement of all the recent disclosures is desirable as an act of justice to all parties, and it is generally believed that some such explanation cannot be much longer delayed. It is also urged as an argument for an open investigation, that the testimony of one of the witnesses who was himself engaged in the fraud, but saved himself from the consequences by giving evidence against his companions, is received without reserve, and that new suspensions take place daily on his word alone; for as the charges he brings forward extend over a period of five years, it is found impossible even for an innocent man to disprove them. It appears that a few days since a landing-waiter was suspended merely upon the version which the witness gave of a conversation held four years ago. The greatest alarm is felt among the officers, who are desirous for an open inquiry as the only means of enabling the public to distinguish between those who are honest and the guilty parties concerned in the recent frauds.

Chartist Meetings.—On Monday evening a meeting, convened by the National Charter Association, was held at their hall in Holborn, for the purpose of making an appeal to all classes of Reformers in behalf of the numerous political offenders now incarcerated in all parts of the country. Mr. W. Balls was called to the chair, and opened the business of the meeting by expressing a hope that the inhabitants of the metropolis, of every grade of reform, would answer the appeal which that meeting was about to make, for funds in behalf of the individuals now incarcerated for the offence of meeting together to discuss their grievances. He considered that the object of the Government in carrying on the present prosecutions was to perpetuate that system of class legislation by which the country had been brought into its present deplorable condition. Mr. Cameron moved the first resolution, to the effect, "that the meeting viewed with alarm and indignation the numerous arrests of the advocates of the People's Charter, firmly believing that the objects of the Government are to perpetuate class legislation by the employment of spies for the prevention of public discussion." He spoke at length in support of the resolution, and concluded by an appeal in behalf of the political prisoners, and their wives and families. Several other resolutions in behalf of the objects of the meeting were then moved, and supported by the Rev. Mr. Mantz, Dr. Lhotsky, and others; after which a subscription was commenced, but the sum raised in the room was very small.

The Mint.—The officers of the Mint have been actively engaged in preparing the new coinage both in gold and silver, in order to meet the demand made upon the Bank for bullion in the payment of the October dividends on Thursday. The average quantity of specie struck at the Mint since the light gold was called in has been 300,000*l.* per week. The Bank has received no less a sum than 6,500,000*l.* sterling in light sovereigns and half-sovereigns since the proclamation, and the present quantity of bullion in its vaults exceeds 10,000,000*l.* sterling. In consequence of the demand for bullion, the new half-farthing coinage cannot be issued from the Mint until the commencement of 1843.

Robberies.—The robbery of diamonds to the amount of 9,000*l.* in Covent Garden Theatre which we noticed in our last is still unexplained. On Tuesday the reward of 400*l.* was augmented to the sum of 1,000*l.* Every exertion has been made by the police to discover the perpetrators, but without effect. The general opinion of the police is, that they have escaped to the Continent.

The Parks.—On Wednesday, in consequence of numerous recent attempts at highway robberies and extortion from persons passing through the Green-park, Hyde-park, and the Regent's-park, a double number of police constables were placed in each park for the protection of the public, and for the detection of a gang of offenders supposed to be lurking in their neighbourhood.

Police.—On Monday morning a man named Jessop, a journeyman leather-dresser in Bermondsey, murdered his wife by cutting her throat with a razor, and then attempted to commit suicide. The woman died instantly, but the man was conveyed to Guy's Hospital, where he lingered until Wednesday. The jury, at the inquest on the husband, returned a verdict of "Temporary Insanity." It appears that they had been married some years, and lived together on apparently happy terms. The man bore an excellent character for his previous conduct, and from circumstances stated at the inquest there is little doubt that he had been for some time subject to temporary insanity.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Saturday, the 1st inst. Total, 924 : Males, 452; Females, 472. Weekly average, 1838-9-40-1—Males, 467 ; Females, 445. The distribution of this mortality over the different districts was as follows :—Western districts, 125 ; Northern, 182 ; Central, 182 ; Eastern, 221 ; Southern, 214.

Provincial News.

Birmingham.—In reference to the account of the proceedings in the case of the Archbishop of Tripoli, which we noticed in our last, the Rev. Mr. Allport has published a letter on the subject, from which the following are extracts. Mr. Allport states that "he is an Archbishop of the united Greek and Syrian Church, in communion with the Romish Church. Of that there is no ground for doubt. He came to England, rather more than a year ago, to endeavour to retrieve losses sustained by the political commotions in Syria. He was received very kindly by the Archbishop of Canterbury, who tried to do all he could in his behalf with the British Government, and also by the Bishop of London. Each of these prelates assisted him, with the understanding that he was going home direct. But, instead of this, he has not shown himself exactly a wise man, but has proceeded till he has raised grounds of suspicion as to his character and professed objects that have thrown a shade over both. If doubts respecting them could be removed, in all other respects he seems deserving of assistance and succour." Mr. H. G. Williams, of Emmanuel College, Cambridge, has also addressed a letter to the daily papers on the subject, stating that he has had frequent opportunities of assuring himself of the Archbishop's real character and pretensions. "The recognition of his dignity," he says, "by various Syrians, some of them of rank, ecclesiastics as well as laymen, and his firman from the Porte, authorising him to exercise his episcopal functions (which firman I have perused), leave no doubt on the subject in my own mind. But to the public generally, it may be more satisfactory to know that he was recognised as Archbishop of Tripoli by Lord Palmerston when in office ; that, as such, he has been kindly treated by the Bishop of London ; and, lastly, that as Archbishop of Tripoli in Syria, he has been an invited guest at Lambeth Palace. The above are facts, for the truth of which I can vouch, and which will, I think, tend to remove any suspicion that the former account may have excited."

Bristol.—The extraordinary marriage-hoax which we noticed in our last continues to be the topic of the hour. It now appears that a citation from Doctors' Commons was served on Tuesday on Mary Ann Morgan, being the commencement of proceedings instituted in the Ecclesiastical Courts by Mr. Woolley, who is desirous of obtaining a divorce as speedily as possible. The papers state that, when the process was served, the wife replied that she had no money to go to law, and must therefore let the law take its course. The prisoners were brought up for re-examination at the Union-hall Police Court on Wednesday, when a solicitor appeared on behalf of Mr. Woolley, and stated that it was not his intention to proceed further in the case so far as relates to the charge of felony. Both prisoners were accordingly discharged.

Blackburn.—The local papers mention with pleasure, in reference to the late Mr. Samuel Crompton, the ingenious inventor of the spinning-machine called the mule, that the Rev. Gilmour Robinson, of Tockholes, has received, during the past week, a communication from Lord Stanley, to the effect that Sir Robert Peel had recommended that a grant from the "Royal Bounty Fund" of the amount of 200*l.* should be immediately paid to the Rev. G. Robinson, to be equally divided between Mr. George Crompton, of Fearnhurst, in Lower Darven, and his brother and sister, of Bolton, children of the above-mentioned Mr. Samuel Crompton.

Hull.—The importation of foreign cattle, under the new tariff, is increasing in this port. Last week the Hamburgh steamers brought 84 fine bullocks, and those from Rotterdam brought 28 sheep. Sailing vessels have also brought small shipments of cattle; and poultry and other provisions arrive daily. Last week the Soren Winkel, from Aarhuus, brought oxen, cows, and ducks; and the Rob Roy steamer, in addition to her live stock, had some barrels of pork and beef. The latter article, of good quality, was selling on Saturday in the shambles at 4½*d.* per lb. The price is said to be rising at Hamburgh. A general impression prevails in this town, that there will be an extensive trade in cattle between Denmark and England, and that the cattle hitherto sent to Hamburgh are likely to be sent to this country, as the better market. Arrangements are making to run steamers next spring direct from Tonder, in the province of Sleswick, and also from a port in the more northerly province of Jutland, to this port or London. Within the last few years great improvements have been made in the agriculture of Denmark, and a trade in cattle to England is expected still further to accelerate improvement. The papers add, that the exportation of oats and other kinds of grain from Denmark to England, within the last four years, has led to the importation of English woollens and cottons in return, and that the peasantry of Denmark are better clothed in consequence.

Liverpool.—It is said that a contract has been entered into at this port for the supply of 5,000 barrels of American flour, to be delivered in November, at 18*s.* per barrel of 196 lbs., which is little more than one penny per pound. The American papers received by the last mail mention a new adventure among the enterprising dealers in New York. A person who keeps a clock and looking-glass warehouse in that city has set out, they state, for this place, after the fashion of Sam Slick, with a cargo of 600 wooden clocks, which are expected to return a handsome profit after payment of the duty of 25 per cent.

Maidstone.—The Kentish papers mention with great regret a serious accident which happened on Thursday last to Sir William Geary, Bart., of Oxonheath. It appears that on entering his dressing-room, he fell over a glass screen, which was broken to pieces, and a large fragment of glass penetrated the right ride of the neck, behind the lower jaw, within a small distance of the carotid artery, and dividing one of its principal branches. The surgeons found that the only chance of saving life was by tying the carotid artery, in order to prevent hemorrhage, the least renewal of which must have been fatal. The operation was performed with success, but unhappily the previous loss of blood produced such entire inanition, that an attack of paralysis was superinduced, which threatens to baffle the skill of his medical attendants. The baronet continues in a precarious state, and great doubts are entertained of his recovery.

Manchester.—For some time past the condition of the Bank of Manchester has been before the public, more particularly since it was ascertained that the concern could not be carried on without a further demand upon the shareholders. The interests of the bank are very generally extended throughout the manufacturing districts, and several persons of small capital had invested all their savings in it from a notion of its security. A private meeting of the directors was held on Friday, when it was resolved to wind up the affairs of the concern in the course of a week. This resolution did not become generally known until Saturday morning, when it was announced in the local papers. It created considerable panic, and was the sole topic of conversation at all the places of public resort; but it was far surpassed when it became known that the managing director, Mr. Burdekin, had absconded. It appears that he took his passage in the North American steamer Britannia, which sailed on Tuesday week for Halifax and Boston. He had previously shipped on board the packet ship Virginian, which sailed on Saturday week for New York, a large quantity of sovereigns, which were obtained, in the regular way, from the Branch Bank of England, on account of the Bank of Manchester. The local papers observe, that, whether in transferring the box from Hanover Street to the Prince's Dock any trick was played by substituting a box of equal weight for the box of sovereigns, remains to be discovered, but the absconding of Mr. Burdekin makes people suspect the worst. At Liverpool the sensation produced in commercial circles by the event was quite as great as in Manchester ; it is said to have absorbed every other subject, even including the India and China news. A meeting of the shareholders takes place this week to consider the condition of the company. The paid-up capital is 780,000*l.*, and a further call is likely to be made forthwith to meet actual deficiencies.—Sir Charles Shaw, the Superintendant of the Manchester police during the recent riots, whose situation terminated on the 1st inst. with the Act of Parliament, has published a long letter on the subject of the outbreak on the 9th of August. It is chiefly a reply to the statements of the Attorney-General at Chester respecting the conduct of the authorities. Sir C. Shaw shows, in the most circumstantial manner, that he had obtained full knowledge of the proceedings of the mob at Ashton, and had communicated with the military, who were ready with his own body of police to prevent the mob not only from entering, but even from approaching Manchester. He had himself been at Ashton in the morning, and had ascertained from the ringleaders that they intended to visit Manchester to turn out the hands, but both he and the commandant were totally powerless without the presence of a magistrate. Finding great difficulty in meeting with a borough magistrate, he "despatched a letter to the stipendiary magistrate, marking it 'immediate,' and requesting him to bring the Riot Act, as he would find the commandant on the Ashton road, with the troops ready. Having been led to believe that the stipendiary magistrate might not be in town, I instantly wrote a similar letter, but with no address, and I put it into the hands of an inspector, to fix it on the first county magistrate he could find, as the borough magistrates for the last three years had refused to act. Before quitting my office to join the police force, which I had left formed near to the Ashton road, I entreated the commandant to impress upon the stipendiary magistrate the necessity of 'having the fight out of town'—that there was no time to think and argue upon 'legal technicalities'—and to bear seriously in mind that every quarter of an hour spent in deliberation was the gain of a mile of ground to the rioters, if on the march." Notwithstanding this, the magistrate allowed the mob to enter the town. "I spoke," says Sir C. Shaw, "to the stipendiary magistrate, who informed me they were asking permission to have a procession through the town, promising to be peaceable, and to return to their homes, after passing through certain streets. I was then quite close to the magistrate. I veered back a few paces, and said, in a loud, distinct voice, (which must have been heard by the military,) 'Sir, I must protest, in the strongest manner, against these people passing. Sir, I report to you officially, that these very men who tell you that they are going to be peaceable, informed me this morning in Ashton, that yesterday they had turned out all the mills round Stalybridge, and that they were coming this morning to Manchester, to do the same, and get bread.'' The magistrate, however, allowed them to enter, and Sir C. Shaw exclaimed in the hearing of the troops that he would not be mixed up in the affair, and proceeded to count the mob. "Shortly after this, the stipendiary magistrate came up, declaring that the leaders of the procession had not kept their promise to him, and asking me where was its head. I answered, 'You will be clever to find it, as by this time it has fifty heads—in fact, they are all loose ; but still if you will permit me, I will and can stop them, as I have about 200 police close at hand.' His answer was, 'No, no, we must have no collision.' We halted here for some time, we doing by persuasion what we could with the mob, who jeered us in return. One man was most insolent to the Commandant. I proposed his being apprehended, but the magistrate would permit of no interference." Even when the mayor had posted proclamations and copies of the Riot Act about the town, Sir C. Shaw says that the police were not allowed to carry them into effect, and "were stopped in the execution of their duty by the express order of the mayor, and ordered to return to the Town-hall." He concludes by saying, "Such was the system, or rather the system of confusion and disorganisation from beginning to end, and neither I nor any civil authority in the borough of Manchester had any right to take credit to himself for preserving the peace of the town during these disturbances. Let the merit rest where it ought, with the praiseworthy and energetic measures of the inhabitants themselves."

Newcastle.—The local papers mention, among the novel importations under the new tariff, a cargo of 137 live geese from Norway. They were in tolerable condition, and were readily disposed of at 3*s.* 6*d.* each.—The papers describe the Prince Albert iron steam-ship, the first ship of any considerable magnitude built of iron on the Tyne. Its length between perpendiculars is 155 feet, length on deck 180 ; main breadth 19½ feet. The construction includes a number of recent improvements : there are two iron water-tight bulkheads, forming the vessel into three distinct compartments, any one of which will keep the vessel afloat should the other two get damaged, which will render her a kind of life-boat.

Newport.—The Monmouth papers give a long account of the rejoicing on the opening of the new docks at Newport, which are remarkable as including the largest lock in the world. The public opening took place on Monday, in the presence of at least 25,000 persons, including most of the leading inhabitants of the county. The event was celebrated by a public dinner.

Portsmouth.—The resolution of the Admiralty respecting the increase of the navy by means of advanced ships, as noticed in a former Number, has come into operation at this port, and about ten or twelve men-of-war, at each of the other ports, are to be fitted immediately. Their masts, spars, and rigging, are to be prepared, fitted, ticketed, and housed in the dockyards, and the ships are to have their bulk-heads put up, their anchors, chain cables, and tanks, on board, and their armament is to be kept ready in the gun wharf. The ships to be advanced at this port are the Neptune, Britannia, Princess Charlotte, Vengeance, Collingwood, Bellerophon, Powerful, Carnatic, Hastings, Pembroke, and President frigate. The Excellent is ordered to bear a complement of 700 men, so that she may be at all times ready to supply seamen gunners to the men-of-war fitting out ; and for the purpose of supplying commissioned and subordinate officers, she is to bear twelve lieutenants, fifty mates or midshipmen, a chaplain, an extra assistant-surgeon, and an engineer.

Southampton.—We noticed, some months ago, the practice of the law courts of Guernsey and Jersey in transporting their criminals to this place and Winchester. The papers of last week state that at the recent sitting of the Guernsey Court, two men convicted of having stolen some pears were condemned to one month's solitary confinement, and afterwards to be banished to England for the term of five years. It is generally understood that this place will be favoured with their presence. A woman was convicted of the same crime, and was condemned to a fortnight's imprisonment, and then to be transported for three years. She is to be shipped for this place also, and then left to find her way to Devonshire. Another person, found guilty of stealing some clothes, was condemned to two months' imprisonment, and five years' banishment to England. Winchester is expected to be the destination of this offender.—Letters from Gibraltar, by the Montrose steamer, announce the arrival of the steam-ship Hindostan at that port on the 29th ult., having run the distance from the Needles to Gibraltar (about 1,200 miles) in 121 hours, being at the rate of ten knots an hour.

Stafford.—On Wednesday great excitement prevailed amongst the authorities of this county and the persons in charge of the gaol, in consequence of the governor, Mr. Brutton, having detected a conspiracy of the rioters confined in it to effect their escape. At an early hour a letter, said to be written by a prisoner named O'Neill, who is under sentence, was put into the governor's hands. This letter disclosed the plan of the prisoners and informed the governor of the time when the plan was to be carried into execution. Mr. Brutton, as soon as he had satisfied himself of the truth of the information, and acting under the advice of Earl Talbot, the Lord Lieutenant, and the other magistrates, adopted every possible precaution against any attempt that might be made to break from the gaol. It is said that Henry Ellis, who is under sentence of transportation for the burning of the Rev. Dr. Vale's house, was the leader of the conspiracy, and on him was found the plan of action adopted by him and his fellow-prisoners. They were to have seized the wardsman as soon as they were allowed to go into the day-room. Having seized him, they would secure him in some safe place, and take from him a key which led to an adjoining room, in which were sixty stand of arms. They were to possess themselves of those arms; and thus prepared for any opposition that might present itself, they intended to make prisoners of the persons in charge of the gaol, and liberate all the Chartists who are at present in custody. They would then fight their way from the town, if they could not escape without detection. What would have been the ulterior mode of action was kept secret. The governor sent off an express to the Secretary of State, detailing the whole conspiracy, and requesting that immediate instructions might be forwarded. On Thursday the gaol was in a state of siege, and guarded on all sides, so that any attempt to escape on the part of the rioters might be promptly and effectually met. There were four pieces of cannon within the gaol, and all the sentries within the walls were doubled, and constantly visited by the governor. It is supposed that the detection of this conspiracy will hasten the departure of the convicts sentenced to transportation.

Windsor and Eton.—The funeral of the Marquess Wellesley took place on Saturday in the chapel of Eton College. It was attended by the Duke of Wellington, Lord Cowley, the Marquess of Douro, the Hon. and Rev. G. V. Wellesley, Mr. Charles Culling Smith, and other members of the family. The service was performed by the Provost. The chapel was completely full, the whole of the Eton scholars being present. Shortly after the conclusion of the ceremony, the members of the family, and the other mourners and attendants, left the College for town, proceeding to Paddington by the Great Western Railway. In consequence of there being an unusually full choir at the chapel, the musical service in the morning at St. George's chapel was dispensed with by permission of the canon in residence; and as a mark of respect to the memory of the Marquess, her Majesty commanded that neither the military nor the private band should perform at the Castle in the evening. During the whole of the morning all the shops near the College and the shutters of the private houses were closed, and remained so until after the funeral.

Railways.—The following are the receipts of the principal railways for the past week:—Great Western, 15,025*l.*; Hull and Selby, 1,171*l.*; Edinburgh and Glasgow, 1,982*l.*; Eastern Counties, 1,015*l.*; Northern and Eastern, 1,333*l.*; London and Birmingham, 17,388*l.*; Birmingham and Gloucester, 2,210*l.*; South Western, 6,602*l.*; Midland Counties, 3,151*l.*; Brighton, 4,390*l.*; North Midland, 5,409*l.*; Grand Junction, 10,642*l.*; Blackwall, 715*l.*; Greenwich, 767*l.*; Croydon, 874*l.*; Birmingham and Derby, 1,535*l.*; York and North Midland, 1,970*l.*—The committee of inquiry appointed at the last meeting of the North Midland Company have resolved, it is said, to propose a reduction, to the large amount of between 17,000*l.* and 18,000*l.* a year, out of an expenditure on the establishment, including wages and salaries of all kinds, of about 44,000*l.* a year.—The sale by auction of the Clarence railway, the first of the kind in connexion with railways, is authorised to take place by the Loan Commissioners for Public Works, to whom the railway is in debt, in the course of next month. The line is in the county of Durham, extending from the Tees to Stockton, with numerous branches, a distance of 36 miles in length. It was constructed soon after the Liverpool and Manchester, and has cost upwards of half a million. The traffic in passengers is small, the trade being principally derived from the haulage of minerals, wharfage, and shipping.—A correspondence has for some time been going on between the Directors of the Greenwich and the Directors of the Croydon Company. It appears that the Croydon Company have found that in consequence of the 4½*d.* toll which they are obliged to pay to the Greenwich Company, they cannot effect a reduction in their fares, and that the present high rates of passage will not allow them to work the railway with a profit. They therefore ask for an equitable arrangement, which shall place each concern on a more favourable footing, the Croydon in respect to an increase of traffic, and the Greenwich in respect to an increase in the amount of toll. The Greenwich Company, however, insist on the payment of the 4½*d.* toll, as a prescriptive right, settled by act of Parliament, and refuse any arrangement which shall lessen this toll, even though the gross receipts should probably be increased by its reduction. There seems little probability of a settlement. In the mean time both companies, as well as the public, are suffering from the high rate of fares, and it is said that the present traffic of the Croydon Company barely keeps the concern together, while the traffic of the Greenwich shows a gradual but progressive decrease, which must ultimately lead to its dissolution.

IRELAND.

Dublin.—We mentioned a few weeks since that an alteration in the commission of delegates for hearing the appeal against the decision of Dr. Radcliffe, given in favour of the Rev. Robert Daly, as Dean of St. Patrick's, was rendered necessary in consequence of the illness of Judge Torrens, one of the commissioners originally named. The new commission has now been perfected, the name of Judge Crampton having been substituted for that of Judge Torrens. If the decision of that Court should be in favour of Mr. Daly, the Government will have the appointment of his successor to the Deanery of St. Patrick's. If Mr. Daly, pending the appeal lodged by Dr. Wilson, the other candidate for the deanery, had been elevated to the bishopric of Meath, the patronage of the Deanery of St. Patrick would at once vest in the Chapter, because the Government and the Chapter have the right of appointment alternately, and Mr. Daly's election, in case of his promotion whilst the appeal is undecided, would necessarily become null and void.—It is stated that Mr. Blackburne, on quitting his present office of Attorney-General, either for the Mastership of the Rolls or the Chief Justiceship of the Queen's Bench, as the answer of Chief Justice Pennefather may decide, is to receive a baronetcy. The two Chief Justices, Pennefather and Doherty, are now on the Continent. Mr. Litton is the new Master in Chancery.

Ballinasloe.—The great cattle fair of this town took place last week, and was in every respect a failure, cattle having fallen to the extent of from twenty to twenty-five per cent. upon the rates of last year. The total number of black cattle exhibited was 11,578; the number left unsold at the close of the fair was 4,161. The prices were from 2*l.* 10*s.* to 3*l.* under those of last year, a very serious decline, which affected all classes of agriculturists. Sheep and horses were on an average 20 per cent. below last year's prices. The number of sheep exhibited was about 7,000 less than last year, and sold under last year's rates by 3*s.* 6*d.* each. It is said by some accounts that the distemper which prevailed among the cattle to a great extent was the cause of this decline, and not the tariff, and that many purchasers were thereby deterred from buying at any price.

SCOTLAND.

Edinburgh.—We learn by the *Scotsman* that her Majesty has given a substantial proof of the gratification derived from her visit to Scotland by transmitting the following donations to the charities of this city:—To the sufferers by the accident occasioned by the falling of the scaffold on the Mound, 100*l.* To the Royal Infirmary, 100*l.* To the Destitute Sick Society, 50*l.* To the Benevolent and Strangers' Friend Society, 50*l.* To the House of Refuge, 50*l.* To the Asylum for the Industrious Blind, 50*l.* To the Royal Public Dispensary, 50*l.* To the Institution for the Deaf and Dumb, 50*l.* To the Magdalene Asylum, 50*l.* To the Edinburgh General Lying-in Hospital, 50*l.* For the widow and family of D. M'Lachlan, Dunkeld, who lost his life by falling over a precipice, after having been employed to light a bonfire on Birnam Hill, her Majesty has sent 30*l.*, and Prince Albert has sent 20*l.* An additional donation of 100*l.* was some time ago presented to the Edinburgh Lunatic Asylum. All the donations have been paid through the Duke of Buccleuch.—The Mid Lothian district is now in such a state of quiet that the party of the 53d Regiment have been withdrawn from the vicinity of Newbattle, and have accordingly returned to head-quarters in this city.

Dumfries.—The Inverness and Dumfries papers have published some letters from a Mr. Pagan, an extensive dealer in cattle, well known in the north, which have attracted much attention in the present operation of the tariff. It appears that Mr. Pagan is much interested in the cattle trade, and being unable to judge, from the great diversity of opinion, of the probable effects of the tariff, made a tour of the Continent, in order to satisfy himself, by personal observation, how far the native producer was likely to be affected by foreign competitors. He proceeded in the first place to Paris, then to Strasburg, and returned by Leipzic and Hamburgh. In regard to Paris, he attended the cattle market at Poissy. "The show," he says, "was stated not to be an average one, and sales brisk; the numbers were—1,530 oxen, 82 cows, 7,233 sheep, and 1,105 calves. The veal was very prime; I never saw anything like it before, and I question if anything like it can be seen in any other place. It is the most fashionable dish in France, and from the way they cook it by far the best. The sheep, with few exceptions, were bad, the best bringing from 25*s.* to 28*s.* English money. There were a good many fair bullocks, which, I consider, were making about 3*l.* in 20*l.* less than they would have done in Liverpool; but the butchers have not so much advantage, as they have 40f. duty to pay on each before they can get them into the city. The dealers are all licensed, and they cannot go to market till they have as much money lodged as pays for the stock they purchase, when the bank settles the account. Some of the cattle had travelled 400 miles, and sheep 300, to the market; and they were not so wasted as people might imagine." Many of the oxen were imported from Rotterdam. "I need say very little of France," he adds; "every one knows that that fine country cannot produce cattle and sheep enough for its own consumption; and, as a proof of this, butcher meat has been on the advance every year; and I am certainly informed that it is from 1*d.* to 1½*d.* higher over the kingdom than it was seven years ago." From Paris, Mr. Pagan set out for Strasburg. He saw on the road much fine land, but in crop everywhere. The great bulk of the crops were wheat and rye, and had a good appearance; but the oats and barley were miserable. On these latter, however, the farmers, either in France or Germany, reckon very little. He was surprised how the sheep could exist on the pastures he saw. At Strasburg he found the land of middling quality, and grazed by inferior stock. He then passed through Germany, as far as Leipsic, and found it in appearance very similar to France. There are few very large farms in Germany. Thirty acres is far above the ordinary size; the whole country being, in general, divided into small patches of from one to twenty acres; and that circumstance, together with the prices that they have been of late receiving for their grain, has induced the industrious inhabitants to cultivate every spot into which they can put the plough. Mr. Pagan thinks it is over-cultivated. "They use very little manure," he says; "and although they have a fertile soil and excellent climate, all land will get exhausted after years of excessive cropping; and I am of opinion they have grown, as far as I saw, as much grain as they ever can again." Along the Elbe no cattle were to be seen, the few that the farmers had being kept in the house. A few flocks of sheep were, indeed, now and then to be met with, but all, apparently, in a state of starvation. That kind of management seems to be deemed best calculated for producing a fine fleece; and, as for the carcases, little or no regard is paid to them. "In Holstein and Jutland the farms are larger, the land good, and a deal of fine cattle kept, which they send in considerable numbers to Hamburgh, at the end of the year, fat. The day on which I attended Hamburgh market, there were only 380 cattle shown, very few of which would have done for the English market, either as fat or lean; also about 900 sheep so decidedly inferior that they are not worth noticing, and could scarcely be sold in this country at any price. But June is generally a poor show of stock in all countries, the stall-fed articles being done and the grass-fed not ready. In the months of September, October, and November, there are often large shows of from 1,400 to 1,700 weekly; and even then the price seldom drops, as that is their time for putting up salted provisions, and the numbers make little difference. Many curers slaughter, for their own hand, from one hundred to two hundred and fifty cattle in a week; therefore prices do not vary so much as in this country, where, when supplies come in largely, they are all for immediate consumption, and have to be sold low to be got quit of. It is probable there will be some importations, and if prices remain as at present in both countries, some little profit may be made; but I am convinced, were we to import 400 or 500 beasts weekly for two months, which would make no material difference with us, we should impoverish the whole Continent, and the price would be higher than here. Under these circumstances I may say the same of salted provisions. They may come in large quantities from other countries; but I do think the agriculturists have nothing to fear from the Continent. It may be said the country has great capabilities, and that stock will increase; but I am of opinion their own wants will increase in proportion, and there are not the facilities for improvement that may be imagined. The great drawback is the divided state of the country. Travel 1,000 miles, and you will find neither a boundary nor subdivided fence; and what can be done with stock of any description on patches of five, ten, or even twenty acres? They may continue to send corn, but I think they will have little else to send; therefore the British farmers need give themselves little uneasiness on that head."

THEATRICALS.

Covent Garden.—A new farce called "Cousin Lambkin" was produced at this theatre on Saturday with success. The plot is as follows:—*Captain Bantam* (Mr. W. Lacy), who has married the niece (Miss Cooper) of a fox-hunting squire, *Mulberry* (Mr. Bartley), has become involved in an "affair of honour," on the eve of going down to the seat of his uncle-in-law, for the first time since his marriage; and as the fox-hunter has an antipathy to duelling, it is necessary that the affair be concealed from him. In this dilemma *Mrs. Bantam* avails herself of the services of *Dr. Lionel Lambkin* (Mr. Harley), a second-cousin of her husband, and pays the old man a visit, while her husband goes to settle the affair of honour. The niece and her escort are introduced to the squire through the agency of *Dainty* (Mrs. Humby), a maid in the establishment, by whom the gentleman is presented as the husband of the niece. From these slender materials all kinds of confusion are produced; and between the bewilderment of the squire, and the surprise of the real husband, ludicrous situations are produced, which told well with the audience, and secured the success of the piece. On Monday evening, after "The Hunchback," in which the characters of *Master Walter* and *Julia* were performed with great ability by Mr. and Miss Vandenhoff, Gretry's opera of "Richard Cœur de Lion" was revived, after an interval of a great number of years. This opera was produced in Paris about the year 1784 or 1785, and its fame was such that, very soon afterwards, it appeared at two London theatres in two different versions within a few days of each other. The story of the piece is founded on the escape of *Richard Cœur de Lion* from the castle in which he was confined by the Archduke of Austria, by the help of his faithful minstrel *Blondel*, who discovered him in his prison by singing a stanza of a favourite lay, which was answered by the voice of the royal captive—an incident which is turned to account in the opera. In other respects, the libretto has little merit; the characters are common-place, most of the incidents are trifling, and the dialogue is heavy. The music, however, is very beautiful; the airs are simple and expressive, and the choruses and concerted pieces are of the most effective character. *Blondel's* famous air, "O Richard, O my King," is the great musical feature of the opera; it is a magnificent song, requiring, however, more dramatic power than Mr. Harrison gave it. This song has acquired an additional celebrity from its being associated with one of the most remarkable scenes of the French revolution, when, at the memorable banquet of the *gardes du corps*, the loyalty of the assembly was roused to a burst of enthusiasm by the band performing, "O Richard, O mon roi!" The air sung by *Blondel* under the walls of the castle, and responded to by the royal prisoner within, is a sweet melody, and made an effective duet. The whole of the music was much applauded. Miss Rainforth's duet with *Blondel* was encored, and sung with her usual sweetness. The dramatic portion of the opera moved heavily along, and the burlesque battle on the stage in the concluding scene produced marked disapprobation. The scenery and decorations were of the best kind, and altogether the getting up of the piece was unexceptionable.

Miscellaneous.

Wasps' Nests.—The danger of inconsiderate offers is illustrated by the following anecdote which appears in the Derby papers:—A gentleman in that county, who was much annoyed by wasps, rather thoughtlessly offered a shilling for every wasp's nest which should be brought to him. All hands in the neighbourhood immediately set to work, and the unlucky gentleman had to pay nearly 40*l.*, there being nearly 800 nests brought to him.

Book Shelves.—To give some idea of the extent of the new portion of the library of the British Museum, it has, as a point of useful information, or, perhaps, also as a matter of curiosity, been ascertained that the whole length of the shelves, which hold 260,000 volumes, was 42,240 feet, or eight miles. The length of the shelves in the library at Munich, containing 500,000 volumes, taking the same proportion, will be fifteen miles and two-fifths. The King's Library in Paris, of 650,000 volumes, must, by the same calculation, have not less than twenty miles of shelf!

The Dutch Colonies.—According to the last official returns from Surinam, there are in that colony 2500 whites, half Christians and Jews. Not 600 are natives of Holland. There are 7000 coloured persons (4000 free and 3000 slaves). There are 46,500 negroes, of whom only 1100 are free. Total population, 56,000. Paramaribo has 15,000 inhabitants, of whom 8500 are slaves, and 6500 free. The whole number of whites is 2000. There are 1200 Jews, 3000 coloured persons, and 10,000 negroes.

Cost of Strikes.—There has been expended in strikes of late years, among the Glasgow cotton spinners, 47,000*l.*; the Manchester cotton spinners, 370,000*l.*; and the woolcombers, 400,000*l.*: Leeds mechanics, 187,000*l.* The late strike in and about Manchester has probably cost as much as all these put together, and yet been productive of no satisfactory results.

Statistics of Longevity.—The following details are extracted from a curious book, by M. Lejoncourt, recently published, and entitled "Les Centenaires, Anciens et Modernes:"—"There have died in England, in the course of the last century, 49 persons who have reached from 130 to 180 years of age. Of those seven reached 134 years, four 138, two 146, four 155, one 159, one 160, one 168, one 169, and one 175. The official returns of Russia show that there were in that empire, in 1814, seven persons aged upwards of 125 years, and one who had passed 160: in 1835, a man died there 135 years old, and in 1838 there died 1,238 persons who had passed 100, of whom 125 were upwards of 120, 111 were from 121 to 125, three from 126 to 130, five from 131 to 140, one was 145, three were from 150 to 155, one was 160, and one 165. In France we do not live so long, yet the following instances of longevity are worthy of notice:—In 1710 a peasant, named Jean Mazard, died at Dun-le-Roi, in Berry, aged upwards of 110: this man preserved his senses to the last, and was married ten times; the last time he entered into the marriage state he was 99 years of age, and the bride 18, who two years afterwards made him a father. A curé of Lisieux, named Desroches, died in 1712, aged 113; he celebrated mass a few days before his death, and resided 91 years in the parish. In the same year died Jacques Thevenot, a labourer at Chateau-Vilain, aged 114, married three times, and the father of thirty-nine children; and an officer, named Bultrade, buried at St. Germain, aged 115, leaving behind seventeen children—the eldest 74, and the youngest 12. In 1718, an apothecary, named Le Baupin, died at Chateaubriand, 107 years old; he was married twice, and was upwards of 80 when he contracted the second marriage; he was the father of thirty-two children—sixteen by each wife, and he was 103 years old when his wife was delivered of two fine boys, who died upwards of ninety years later. In 1747 died at Lourdes M. Nazon de Vigé, 118 years old; he was passionately fond of shooting, and had good sport not long before his death; he was upwards of 100 when he married. In 1757, a farmer of Bar, near Tulle, named Nouthac, died at the age of 115; he never had a day's sickness, was married three times, was 92 when he entered the state of wedlock the second time, by which union he had several children, and was 102 when he married the third time." In addition to these facts, we may state that there has just died, at Paris, a woman, aged 103 years, called Madame Langlai, who has left many children behind her, the youngest of whom is 78 years of age. These examples of longevity do not approach the two English centenaires, Thomas Parr and Henry Jenkins, one of whom, if we are to place any belief in statements of this kind, lived to 152 years, the other to 169. There is also another example in England, John Forester, of Cumberland, who is said to have died aged 138 years, leaving a daughter 104 years old. But in all these instances, it is necessary to bear in mind that no one example has been proved by the registers of birth, or by such evidence as would be admitted in a court of law.

SPORTING.

NEWMARKET SECOND OCTOBER MEETING.

MONDAY.—The second meeting commenced to-day under very favourable auspices. The entries were unusually full, the weather fine, and the heath was crowded with a large and fashionable assemblage. The racing began with

A Match for 100 sovs., h. ft. T.Y.C.—Lord Albemarle's Tilcho (Robinson), Mr. Goodman's Bother'em (Rogers). Even betting. A dead heat.

Handicap Sweepstakes of 20 sovs. each, for three-year-olds, &c. T.Y.C. (11 subs.)—Won by Lord Stradbroke's Jeremy Diddler (Wakefield), beating Mr. Boyce's c. by Hymen, dam by Perchance. The following were not placed: Col. Peel's Cameleon, Duke of Portland's g. by Glencoe, Mr. Etwell's Pelerine, Mr. Gratwicke's Clementina, and Mr. Payne's Rapture. Betting—6 to 4 on the field agst Cameleon and Jeremy Diddler, 5 to 1 agst Tragedy, (t.) and 4 to 1 agst Pelerine (t.) Won by a length.

Match, 500*l.*; h. ft.—Lord Eglinton's Dr. Caius (Lye) beat Mr. Pettit's St. Francis. 6 to 5 on St. Francis. Won easy by a length.

Col. Peel's Garry Owen (Nat) beat Lord Albemarle's Ralph. T.Y.C. 200*l.*; h. ft. Even betting. Won by a neck.

50*l. for two-year-old colts and fillies.* T.Y.C.—Won by Mr. Ongley's The Queen of the Gypsies (Sly), beating Captain Daintree's Brother to African. The following also started, but were not placed: Mr. Payne's f. by Muley Moloch, Mr. Stevenson's c. by Hornsea, Mr. G. Clarke's f. Ameine, Lord Stradbroke's c. Nylghan, Mr. Eddison's Prince of Wales, Lord Exeter's c. by Beiram, Mr. Jones's Master Harry, General Yates's Rooksnest, Col. Peel's Seringo, and Lord Lowther's c. by Bay Middleton. Betting—5 to 2 agst Queen of the Gypsies, 4 to 1 agst Mr. Payne's filly, and 7 to 1 agst Hornsea c. Won easy by a length.

50*l. for three-year-olds. &c.* A.F.—Won by Mr. Etwall's Discord (J. Day), beating Mr. Combe's Rosalind, Duke of Bedford's John o'Gaunt, Mr. Pettit's St. Francis, Mr. Stephenson's Ghuznee, and Mr. Batson's Barba. Betting—6 to 5 agst John o'Gaunt, 9 to 2 agst Discord, 4 to 1 agst St. Francis, 4 to 1 agst Barba, and 5 to 1 agst Rosalind (taken). Won by a length.

Duke of Bedford's Oakley received forfeit from Lord Eglinton's Melior; T.Y.C.; 300, h. ft.

Lord Albemarle's Buffalo received forfeit from Mr. Osbaldeston's Skipton; A.F.; 200, h. ft., and 25 ft. if declared.

Sweepstakes of 100 sovs. each, h. ft., first half of Ab. M. (3 subs.) Won by Duke of Bedford's King of the Peak (Edwards), beating Mr. Thornhill's Menalippe. Betting—11 to 8 on the King of the Peak, who made all the running, and won by three parts of a length.

TUESDAY.—*Match* for 100*l*, h. ft. T.Y.C.—Lord Albemarle's Minaret (Robinson) beat Lord Kelburne's Retainer colt. Betting—7 to 4 on Minaret. Won in a canter by two lengths.

Mr. Payne's Cecil (Nat) beat Duke of Bedford's Magog. T.Y.C. 150, h. ft. 7 to 4 on Magog, who was defeated in a canter by two lengths.

The Clearwell Stakes of 30 sovs. each, 20 ft.; T.Y.C. (26 subs.)—Won by Col. Anson's Napier (F. Butler), beating Col. Peel's Murat. The following also started, but were not placed: Lord Exeter's f. by Jerry, Mr. Bouverie's c. by Bolero, Mr. J. Sadler's Testy, and Mr. Watts's c. by Yaxley. Betting—2 to 1 agst Napier, 5 to 2 agst Yaxley colt, 3 to 1 agst Testy, and 4 to 1 agst Murat. Won by a head after a splendid race.

Lord Exeter's Celia (Darling), beat Lord Albemarle's Nuncio. T.Y.C. 200, h. ft. Betting—6 to 5 on Nuncio. Won by two lengths.

Lord Exeter's Albion received forfeit from Mr. Greville's Gunter. A.F., 200, h. ft.

The *Cesarewitch Stakes*, of 25 sovs. each, 15 ft., with 300*l.* added by the Grand Duke Cesarewitch; the second to receive 50*l.* Cesarewitch course, two miles and a quarter. Won by Mr. F. Clarke's Arcanus (T. Day, jun.); beating Duke of Grafton's Florence. The following also started:—Mr. Goodman's The Shadow, Mr. Graydon's Roscius, Lord Albemarle's Ralph, Major Yarburgh's Heslington, Mr. Etwall's Thistle-whipper, Mr. Isaac Day's Tamburini, Mr. Isaac Day's Portrait, Lord Chesterfield's Rhodanthe, Lord Kelburne's c. by Muley Moloch, Mr. W. Sadler's Bellissima, Lord Albemarle's Buffalo, Mr. Stephenson's Ma Mie, Lord Eglinton's Blue Bonnet, Duke of Portland's The Gleaner, Mr. W. S. Stanley's f. by Bizarre, and Duke of Beaufort's Anspach. Betting, 7 to 2 agst Bellissima, 10 to 1 agst Arcanus, 10 to 1 agst Portrait, 10 to 1 agst Blue Bonnet, 13 to 1 agst Lord Kelburne's colt, 14 to 1 agst Rhodanthe, 14 to 1 agst The Shadow, 20 to 1 agst Ma Mie, 20 to 1 agst Roscius, 20 to 1 agst The Gleaner, 20 to 1 agst Florence, 16 to 1 agst Ralph, 25 to 1 agst Buffalo. After four false starts, the whole team quitted the post tolerably compact, Thistle-whipper taking the lead at a strong pace, followed by Anspach, behind whom were Bellissima, Ralph, Florence, the Bizarre filly, Arcanus, Blue Bonnet, and Portrait, pretty nearly in the order we have given their names. The race proceeded in this manner for nearly half-a-mile beyond the gap, where Thistle-whipper broke down, and the lead was taken by Anspach; on his resignation at the new ground, Florence took up the running, followed by Bellissima, Ralph, and the Bizarre filly, Arcanus lying three lengths behind them: in this order they reached the bushes hill, where Arcanus moved towards the front, his position at the bottom being at Bellissima's quarters on the outside. Florence, Bellissima, and Ralph continued the race, apparently unconscious that Arcanus was so near, to the last stride, Florence beating Bellissima by a neck, and Bellissima beating Ralph by a head: Arcanus, however, went up at the last moment, and defeated them all by a neck. The Bizarre filly ran forward to the end, and was a good fifth. The ruck followed, headed by Blue Bonnet and The Shadow. Value of the stakes, 860*l.* Mr. Clarke, the owner of Arcanus, and his friends win, it is said, from six to seven thousand pounds. The winner was trained by Messer, of Welwyn, and was cleverly ridden by a son of the late William Day, of Ascot Heath.

WEDNESDAY.—*Sweepstakes* of 10 sovs. each. T.Y.C.—The winner to be sold for 80*l.* &c. (9 subs.)—Won by Mr. Rogers's b. c. by Hornsea (Bartholomew), beating Mr. G. Clark's Ameine. The following also started, but were not placed:—Mr. Shelley's Blazer, Mr. Pettit's Sweatmeat, Lord Albemarle's Rowland, Mr. S. Smith's Miniature, Mr. Osbaldeston's b. f. by the Saddler, Mr. Boyce's King of Trumps, and Lord Exeter's f. by Sultan or Reveller. Betting—3 to 1 agst the winner, 3 to 1 agst Ameine, 4 to 1 agst Sweetmeat, 4 to 1 agst Rowland, and 6 to 1 agst Blazer. Ameine made the running, followed by Sweetmeat, Blazer, and Miniature, the Hornsea colt waiting behind; they kept in this order to the cords, where Sweetmeat gave up, the Hornsea colt joined the front rank, and a pretty race took place between the four, the Hornsea colt winning cleverly at last by a length. Miniature and Blazer were close together at Ameine's quarters, and Rowland well up. The winner was claimed.

The Town Plate of 50l, T.M.—The winner to be sold for 200*l.*, &c.—Won by Mr. Rogers's Prosody (Bartholomew), beating Mr. Dawson's The Biddy. The following also started, but were not placed:—Mr. W. Bignold's Camille, Sir S. Spry's The Jewess, Mr. I. Day's Viola, Mr. Key's Image, Duke of Grafton's Utopia, and Mr. Osbaldeston's Woldsman. Betting—2 to 1 agst Woldsman, 4 to 1 agst Utopia, 6 to 1 agst Camille, 6 to 1 agst The Jewess, 6 to 1 agst The Biddy, 6 to 1 agst Prosody. Woldsman cut out the work to the new ground, where Prosody and The Biddy headed him, and ran together to the end, Prosody winning by a head only. Image and Woldsman were third and fourth. Colonel Peel's Cameleon received forfeit from Lord Eglinton's Augury. T.Y.C. 100, h. ft.

THURSDAY.—*Match.*—Lord Kelburne's Give Him a Name (Nat) beat Lord Eglinton's Jamie Forest; 200; last three miles of B.C. Even betting. Won by a length, easy.

Lord Eglinton's Pompey (Lye) beat Lord Kelburne's He has a Name: Ab. M.; 100. 5 to 2 on Pompey. Won easily by a length.

Handicap plate of 100*l.*, for 3-yrs olds and upwards. A.F.—Won by Mr. Stephenson's Ma Mie (Hall), beating Lord Chesterfield's Rhodanthe and Mr. Charlton's Lasso. The following also started:—Lord Orford's Y. Quo Minus, Mr. Etwall's Palladium, Mr. Wright's Aspatria, Mr. Francis's Cloister, Mr. Osbaldeston's Woldsman; Mr. Boyce's c. by Hymen, dam by Perchance: Mr. Goodman's f. by Ishmael, out of Balance; Mr. Bradford's Sister to Confusionée; and Lord Exeter's Revision. Betting 2 to 1 agst Palladium, 5 to 1 agst Sister to Confusionée, 7 to 1 agst Y. Quo Minus, 7 to 1 agst Rhodanthe, 7 to 1 agst Ma Mie, 7 to 1 agst Aspatria, and 7 to 1 agst Lasso (who was third). Won in a canter by two lengths.

Match.—Duke of Bedford's John o'Gaunt received forfeit from Mr. Payne's Johnny; T.Y.C.; 200, h. ft.

Law.

THE SPECIAL COMMISSION, STAFFORD.—The trials of the prisoners have been proceeding during the week, but the details, with few exceptions, have little interest for the general reader. The facts adduced in evidence have been already before the public, and much of the interest of the individual cases is necessarily local. Since our last report, the prisoners charged with entering shops at Hanley, and stealing therefrom wearing apparel, have been found *guilty*; others have been found guilty of demanding money with threats; others for illegally assembling; others for creating a riot at West Bromwich; others for a riot and assault on a constable at Gilbert's Colliery; others for assaulting constables at Stoke upon-Trent; others for pelting the yeomanry with stones, &c. Nearly all the cases come under one or other of these classes. The prisoners charged with setting fire to the house of Wm. Harding, at Stoke-upon-Trent, were acquitted for want of evidence. The twenty-six prisoners found guilty of demolishing and burning the house of the Rev. Mr. Vale, noticed in our last, were sentenced on Monday. The Lord Chief Justice addressed them in an impressive manner, and then sentenced 7 to be transported for 21 years, 1 for 15 years, 6 for 10 years, 4 to imprisonment and hard labour for 12 months, 3 to imprisonment and hard labour for 4 months, and 1 to imprisonment and hard labour for 1 month. The trial of William Ellis, the Chartist leader, and 17 companions, for burning the house of the Rev. R. E. Aitken, incumbent of Hanley, concluded on Monday, having lasted three entire days, when 14 of the prisoners, including Ellis, were found guilty, and 3 acquitted. The progress of this commission is likely to be much prolonged, in consequence of the prisoners severing in their trials. In the case of Roberts, charged with being concerned in the destruction by fire of Lord Granville's offices, at Shelton, the jury, under the direction of Mr. Baron Parke, acquitted the prisoner, on the ground that there was no proof he was on the premises or took any part when the fire was first lighted. The learned judge held that, to support the charge as laid in the indictment, such proof was necessary. This result applied to several other prisoners, who were then indicted for the riot, and sentenced to various terms of imprisonment. In one instance, however, the fact of being concerned in burning the offices was clearly proved, and the prisoner was sentenced to transportation for life. Numerous prisoners were sentenced to various terms of imprisonment and transportation for burglaries and robberies during the disturbances. In the case of O'Neil, the Chartist leader, the judge acceded to the application made in his behalf, by allowing him to traverse, and be admitted to bail.—The trial of Thomas Cooper, the Chartist lecturer, for arson, terminated on Wednesday. The Solicitor-General was occupied upwards of an hour in his reply. The Lord Chief Justice summed up, and the jury, after a few minutes' deliberation, returned a verdict of "Not Guilty." Cooper protested in a most solemn manner his innocence of the charge, and thanked the Lord Chief Justice and the jury for the pains they had taken with his case, and the fairness with which his Lordship had summed up the evidence. He also thanked his counsel, Messrs. Lee and Allen, for their assistance. The prisoner was then removed in custody, there being another indictment against him for sedition.—This morning two prisoners were charged before Lord Chief Justice Tindal with setting fire to Mr. Parker's dwelling-house, and found Guilty. One of them implored for mercy, saying that he had a wife and a large family. His Lordship regretted his situation, but his duty compelled him to sentence them both to 21 years' transportation.—The men arraigned for demolishing the dwelling-house of Mr. Bailey Rose, a stipendiary magistrate, were acquitted of the demolition, but found guilty of a riot. One was sentenced to two years' imprisonment and hard labour, and another to eighteen months' imprisonment and hard labour.—The prisoners concerned in burning the house of Mr. Parker, of Shelton, were also found guilty, and sentenced to transportation for various terms. The prisoners indicted for the burning of Dr. Vale's house were also found guilty. The other cases present no feature of general interest.

SPECIAL COMMISSION, CHESTER.—On Thursday, the 10th, the Special Commission was opened in this city by Lord Abinger, Mr. Baron Alderson, and Mr. Justice Creswell. The Grand Jury having been sworn, and Mr. E. J. Loyd, of Oldfield Hall, appointed chairman, Lord Abinger addressed them at considerable length. After alluding to the circumstances which brought them together at this unusual season, his Lordship said, "We cannot reflect on the occurrences which have recently taken place in the manufacturing districts without mixed emotions of compassion, and, if I may say so, indignation—compassion at the weakness and ignorance of those deluded multitudes, who imagined they could effect the purposes they had in view by force and violence, and who, as they never fail to do, become the victims of their own delusion, and suffer misery and privation, and many of them punishment—indignation at the artful contrivances of those who, to serve their own private objects and their own political ends, had promoted and excited the delusion of the industrious classes by addressing to their minds deceitful arguments, unfounded in reason or in sense, and had then endeavoured to take advantage of the delusion they had caused, in order that they might thereby carry into effect their own objects. I am afraid that the manufacturing classes have been of late the dupes of this sort of persuasion; and you will find in the occurrences which have called you together sundry examples of this delusion. You will find that there is a society of persons, who go by the name of Chartists, and who, if they have not excited or fomented those outrages which will be brought under your notice, have, nevertheless, taken advantage of them for their own purposes, have endeavoured to prevent the unfortunate people from returning to their work, and sought so to direct them that they might be conducive to the attainment of political objects. And what is the object of the Charter, which these men are seeking? What are the points of the Charter? Annual parliaments, universal suffrage, and vote by ballot. Yet, gentlemen, you will find by the evidence which will be produced before you, that it has been inculcated upon many misguided persons, that the sovereign remedy for all abuses, and the only means of putting themselves in possession of such a share of power as would enable them to vindicate their own rights, and secure themselves against oppression, is by the enactment of what they call the People's Charter. In what a strange situation this country would be placed, if those who have no property were to possess a preponderating voice in the making of the laws! These unhappy men do not consider that the first object of civilised society is the establishment and preservation of property, and the security of person. What, then, would be the state of any country, if multitudes were to make the laws for regulating property, or were permitted to employ physical force to restrain individuals from employing their own labour according to their own judgment, or preventing their subsistence? The foundation of civilised society may be considered to consist in the protection of property and the security of person; and if these two objects were removed, society must be dissolved. What a strange effect, then, would the establishment of a system of universal suffrage produce! for under it every man, though possessing no property, would have a voice in the choice of the representation of the people. The necessary consequences of this system would be, that those who have no property would make laws for those who have property, and the destruction of the monarchy and aristocracy must necessarily ensue. I do not pretend to judge the motives of those individuals who entertain such views as I have been alluding to, but they seem to forget that it is impossible to establish a perfectly democratic representative assembly, in the formation of which every man in the country should have a voice, without eventually destroying the monarchy and the influence of property, and leading to the creation of a form of government which would become in the end an odious tyranny. Such is the history of all attempts to establish a democracy in countries where a government consisting of mixed elements formerly existed. There is a country which cannot be spoken of without respect and attachment, as emanating from ourselves—I allude to America, from which you may collect what security for property is afforded by a pure republic. In the different States of America there are pure democratic associations elected by universal suffrage and vote by ballot; and some of these States have recently exhibited the regard paid to property by democratic assemblies, by having protested against paying the public creditor, and disregarded their own obligation to obey their own law made for his security. If such a system of democracy were established in England, the first consequence would be, that the security of property would be removed; the public creditor and all commercial accumulations would be destroyed; and, finally, or perhaps the first object aimed at, would be the destruction of property in land. There would be a universal agrarian law. The formation of such a government in a country like this must work universal ruin and distress; and after inflicting the most bitter of all tyranny, that of a democratic assembly, would terminate in a despotism." His Lordship then took a general review of the different cases which would be submitted to the jury, and explained the law applicable to each. "I cannot conclude," he said, "without repeating my expression of compassion for the unhappy people who have acted under the delusion I have referred to. But, gentlemen, the law takes no account of such delusions; and if a man commits guilty acts, he must be prepared to submit to the consequences of his conduct. It is true that the poorer classes of the country have been suffering from great privations; and I may allude to this subject, as it is matter of notoriety, and has formed matter of public discussion; but it is very singular that the time chosen to break out was at a period when a more settled commercial policy had been adopted, when every person expected a revival of manufacturing prosperity, and when, I believe, every person felt there was existing a salient point from which commercial prosperity might take its start. It is singular that this should be the moment chosen to foment these disturbances; and the country has suffered in consequence a suspension of that prosperity which might confidently have been anticipated, and of which, I trust, it is not too late to hope for the return."

The trials presented little difference in their details from those reported under the Stafford Commission. The prisoners indicted for the attack on Stockport workhouse were found guilty, and sentenced to terms of imprisonment varying from one year with hard labour to 14 years' transportation. Six Chartists, charged with conspiracy in connexion with the Chartist meetings at Staleybridge, were found guilty. In this case, Lord Abinger, in summing up, dwelt upon the general tendency of Chartist meetings, and said that all change in the Constitution, even from worse to better, was to be deprecated if effected by force or violence—"Now, he would ask, what were the objects likely to be obtained, what was the object sought, by the advocates of the Charter? It was such a change in the laws as would give to the labouring classes the framing of all laws for the protection of property. That was the object avowed in the placard which had been produced in evidence, and the man who had been capable of writing such a placard must have had intelligence enough to know that such an object never could be effected without force and violence. It must be known that the House of Commons, as at present constituted, would never allow every man in the kingdom, whether having property or not, to have a vote for our representatives, or allow their members to sit without a property qualification, or sitting to receive a salary for their parliamentary services. But even if the Commons should consent, the Lords would, to the last, resist the destruction of their own privileges. Finally, was it to be expected that the Sovereign would, without force or violence, consent to the changes proposed by the charter? There was one point which had continually been urged at Chartist meetings, to which, involving as it did a gross fallacy, independent of its disloyal and treasonable character, he wished to call the attention of the jury, and of all who then heard him. At these meetings constant allusions were made to the Queen, and to the amount of her income, and it was alleged that vast sums were expended in her support which were extracted from the pockets of a starving people. Now, nothing could be more untrue than this, as the Queen had as good a right to her revenue as any private individual had to his land and income. From the time of Edward the Confessor down to that of Charles II. the Sovereign was supported by his own estates and feudal rights, but the latter sovereign accepted duties to the amount of 600,000*l.* a year (a very inadequate sum) in lieu of them. This arrangement lasted down to the time of George II., when, the duties producing a much larger sum, a charge on the consolidated fund was substituted. Why, if ever there were Sovereigns who had made sacrifices for the good of their people, the Sovereigns of this country had done so. Even the last vestiges of their rights and property in the Crown lands were given up by his late Majesty King Wm. IV., and her present Majesty Queen Victoria, and at this moment the Sovereign relies for her support wholly on her Parliament and people. Nothing, therefore, could be more untrue than that the Sovereigns were supported by taxes drawn from the pockets of the people; they received nothing, in fact, but that for which they had yielded up a most ample equivalent. After a few comments on the evidence, his Lordship concluded. The Jury then retired, and in a short time returned with a verdict of *Guilty*. The prisoners were sentenced on Saturday, five to two years' imprisonment, one to 18 months, and the others to one year's imprisonment. The prisoners indicted for the attack on Mr. Shipley's mill, reported in this Paper at the time, were sentenced to various terms of imprisonment, varying from three months to one year. The prisoners charged with stopping the railways and canal works, and with rescuing their companions from the police, were found guilty, and sentenced to imprisonment for periods ranging from twelve months to two years.

Lancashire Special Commission.—On Monday Lord Abinger and the other judges who presided at the Chester trials opened the special commission at Liverpool, with the usual formalities. The proceedings commenced with Lord Abinger's charge to the Grand Jury. It dwelt particularly on the different classes of offences, and entered even more largely into collateral subjects connected with the condition of the people than his lordship's address at Chester. "It does not appear," he said, "from any evidence I have hitherto seen or heard, that the people who were engaged in these excesses complain of the high price of provisions, or the want of labour. What gave rise to the immediate occurrence which was the commencement of these transactions, has not at present been ascertained. Whether it was owing to imprudence or to the indiscretion of any of the master manufacturers; whether it originated in the schemes of any persons who considered that a general turn-out might be advantageous to their peculiar political objects; or whether, when it commenced, it was not checked as early as it might have been by greater activity in the magistrates—all these are matters at present left in obscurity, and which time alone can develop. But certain it is, from the information to which I have referred, that the disaffection of the common people—of the labouring classes—does not seem to have originated in any voluntary feeling, if I may so express myself, of their own, respecting their privations, or respecting the high price of provisions. They all seem to be sensible, they all have intelligence enough to know that the price of wages must depend on the price of provisions; and therefore I think they are prepared to see that those who promise them an increase of wages by a diminution of the price of corn are not persons who are to be trusted." In regard to the Chartists, "it seems," he said, "that the argument they used, and the argument used in many of the speeches of those who addressed the multitude generally, was to get 'a fair day's wages for a fair day's labour;' and that nothing would insure that object except giving to the labouring population an equal, if not a preponderating, voice in the legislation of the country. For this purpose they propose the changes referred to; namely the principles of the charter; that is to say, that the labouring classes who have no property are to make laws for those who have property; that the labouring classes who show by their conduct that they will exercise a tyranny over their fellow-subjects to prevent labour, are to make laws for the protection of labour. These persons have never taken into their consideration that one of the objects of law and civilised society is the protection of property from the violence of one or more individuals, and the protection of man's person from the violence of those who attack him. They show by the example of their own loose conduct, and the violation of law, how little calculated they are to compose such a legislature as that which they aim at forming a part of. His Lordship concluded as follows:—"Who can say, in this county of Lancaster, that labour wants protection from the law? Who can say that the working man, even of the lowest description, if he possesses diligence, talent, application, and frugality, may not arrive at the highest honours of the State? How many examples are there of persons who, in classes of life not superior to many of those who I am afraid will be the objects of these prosecutions, by their industry, talent, and frugality, have acquired fortunes, and been themselves the employers of labour! How many have thus acquired honour and distinction! Gentlemen, the fair fabric of the British constitution these unhappy men were desirous of destroying. That constitution is the only one in the world that has ever shown, by repeated examples, that labour is protected, and the rights of the poor man, if they are only exercised with diligence, sense, and frugality, are sure to lead him to independence and fortune. What country in the world is there that has produced such bright examples? Yet the practice of those individuals would put to hazard all that we enjoy under such a constitution, under colour of what? Why, under the colour of giving the poor man greater influence than he now has in the formation of the laws. Gentlemen, by the law of England labour is protected. No doubt labour is the commodity of the poor man, and ought to be protected; and I believe the law of England is so framed, that if any oppression takes place from the master to the labourer, the law furnishes a remedy. The law does not restrain any man from quitting his master at the termination of his civil contract with him; if he is dissatisfied with his wages, or the mode of conducting his employment, the law does not give to the master any authority to retain him; the law leaves him at perfect liberty to make such engagements as he thinks best, and when they are terminated, to quit him. The attempt to put a restraint upon masters would at once destroy capital; and the result would be, that when capital was destroyed property would be destroyed, and all mankind would be reduced to an equality; and if all became labourers, what would the unhappy labourers gain by it? Why the market of labour is like other markets; the more there is, the cheaper it is—and if all became labourers, what would be the price of labour? I rather think it would be very trifling; therefore the delusions under which they have been acting, if once explained, are so obvious, that one is surprised how men of common sense could be so deluded. One is led to conclude that those who are guilty of propagating among the working classes these doctrines, are themselves conscious of the mischief which they propagate, and that if they should be detected they deserve condign punishment." The first trials concluded were those for attempting to destroy the mills of Messrs. Sterling and Beckton at Manchester; the prisoners were found guilty, and sentenced to a year's imprisonment. The other cases tried in the early part of the week presented no feature of particular interest; in all of them the prosecution was conducted with great forbearance, and the Crown lawyers often recommended the prisoners to mercy.—The prisoners convicted of having "with force and terror" stolen a number of loaves out of a baker's shop were sentenced to transportation for seven years. Another party, indicted for conspiracy and riot, in order to turn out the hands at the mill of Mr. Morris, of Salford, were found guilty and sentenced to one year's imprisonment with hard labour at Kirkdale gaol. The prisoner charged with felony at the Bolton railway station, by stealing ten pieces of wood for the purpose of supplying the mob with weapons of defence, was sentenced to transportation for seven years. The prisoner indicted for conspiracy to turn out workmen at the mill of Mr. Speakman, at Salford, was sentenced to imprisonment for 12 months, with hard labour.—Those convicted of rioting at Manchester and Ashton were sentenced to different terms of imprisonment, varying from three to twelve months, according to the circumstances of each case. The Grand Jury on Tuesday came into court with a true bill of enormous length, for conspiracy against the Chartist Executive, consisting of Mr. Feargus O'Connor, the Rev. W. Hill, the Rev. J. Scholefield, Mr. Bernard Macartney, Dr. Peter M'Douall, and others, amounting to the number of sixty. An application was immediately made on behalf of Mr. O'Connor to be allowed to plead to the indictment by proxy, as his health would not allow him to be removed from home without risk to his life. After some conversation, during which it was announced that he pleads not guilty and traverses, the Attorney-General said he had no objection to the application, which was accordingly granted by Lord Abinger. On Wednesday the same parties, composing the Chartist Executive Committee, amounting in all to 27 persons, were charged with conspiracy, and traversed to the next assizes. They were ordered to find bail, themselves in 200*l.*, and two sureties in 50*l.* each, to appear at the next assizes, and to keep the peace in the mean time. John Turner pleaded guilty to the charge of printing, at Manchester, a seditious placard, "The Address of the Executive Committee of the Chartist Association." The prisoner expressed contrition for the offence he had committed. At a subsequent period of the day he was discharged on his own recognizance of 100*l.*, and two sureties of 50*l.* each. Richard Warwick was charged with having at Oldham published a seditious placard. The Jury, after a short deliberation, found the prisoner Guilty. Lord Abinger, in passing sentence, expressed his opinion that the document was seditious, if not treasonable. He was inclined to think that, combined with a conspiracy to produce such a document, and a conspiracy acting consistently with the language it contained, the concocting and issuing it would be high treason. However, as the prisoner had stated that he had no concern in the document, and as there was no proof that he had, though he ought not to have exposed it to public view, and as he had taken no part in the riotous movements which affected the town of Oldham, he was not disposed to pass so severe a sentence on the prisoner as he should pronounce on any one who had mixed himself up with the publication. The prisoner had attempted to throw odium on the prosecutor by representing that the prosecution originated in unworthy motives; but he was surprised that the prisoner, who appeared to have some sense, should have endeavoured to prevail on the Court to believe that he was the victim of some private malice. On the contrary, if he (Lord Abinger) were to give his opinion, he should say sufficient alacrity had not been shown in putting down these publications the moment they were seen; he thought there ought to have been more alacrity shown in bringing the parties who published them to punishment. He thought he could not do less than sentence the prisoner to be imprisoned for the space of six months in the House of Correction. A second indictment charged the prisoner and his son with the publication of another seditious placard. The Attorney-General said he was anxious to adopt the most lenient course which, consistently with the discharge of his public duties, he felt himself justified in doing; and he trusted the leniency he was now about to show would not be thrown away on the prisoners and other persons. As the elder prisoner had been already convicted, and as the son might be taken to have acted under the influence of his father, he should offer no evidence on the present indictment. The jury accordingly acquitted the prisoners on this charge; and the younger Warwick was discharged.—Alexander Hutchinson was indicted for publishing a malicious and seditious libel, on the 16th of August last, at Manchester, and also with attending an unlawful meeting. The prisoner pleaded Guilty. The Attorney-General said, he had no doubt that Hutchinson had hitherto enjoyed a good character; and the statement of his learned counsel to that effect was known to be true, by those who instructed him (the Attorney-General). He should therefore merely ask the Court to require Mr. Hutchinson to find sureties to appear for judgment when called upon. The prisoner then entered into the required sureties, himself for 100*l.*, and two other persons for 50*l.* each.

MARK LANE, **Friday**, Oct. 14.—The Market is very bare of English Wheat, and prices are nominally the same as on Monday.—The sale of Foreign was very limited, and confined to the trade of the Town Millers.—In Bonded nothing doing. Barley, Beans, and Peas remain without alteration in value, with a short supply. The Oat Trade is exceedingly flat.

GAZETTE OF THE WEEK.

INSOLVENT.—J. Allen, Much Wymondley, Hertfordshire, dealer in cattle.

BANKRUPTS.—J. T. Boor, 128, Lower Thames-street, City, eating and lodging-house keeper—G. Ridley, formerly of Mincing-lane, City, afterwards of St. Mary-at-Hill, City, and of Southampton-street, Camberwell, and now of 10, Gould-square, City, wine and spirit merchant—T. M'Conkey and A. Howie, of Lambeg, Downshire, and of Lancaster, bleachers—S. Thorp and T. Thorp, Manchester, merchants—J. Thorp, Manchester, merchant—G. D. Thomas, Wem, Shropshire, grocer—A. Jacob, Manchester, merchant—J. Bryant, King William-street, West Strand, bookseller—R. Keen, late of West Hay, Somersetshire, but now of Old George-yard, Snow hill, City, cheese-factor—L. Goodman, Tottenham-court road, draper—H. Brand, Cambridge, slater—W. Castle, Wanborough, Wiltshire, sheep-dealer—J. C. Rawdon, Leeds and Huddersfield, wool-merchant—E. Mansell, Chippenham, Wiltshire, upholsterer—E. Buredekin, Manchester, banker—B. Jones, Llanidloes, Montgomeryshire, banker.

SCOTCH SEQUESTRATIONS.—E. Henderson, Edinburgh, wine merchant—R. Torrance, Edinburgh, tin-plate worker.

BIRTHS.—On the 10th inst., at Longford Castle, near Salisbury, Viscountess Folkestone, of a son—On the 11th inst., in Gower-street, Bedford-square, the lady of K. S. Parker, Esq., of Lincoln's-inn, Queen's Counsel, of a son—On the 9th inst., at No. 18, Henrietta-street, Cavendish-square, the Hon. Frances Lady Dallas, of a son—On the 10th inst., at Beabeg, the Hon. Mrs. Smith, of a son—On the 11th inst., at Holebrook House, near Wincanton, the lady of J. E. Wyndham, Esq., of a son and heir—On the 7th inst., in Tilney-street, Mayfair, Mrs. Fremantle, of a son—On the 5th inst., at 47, Heriot-row, Edinburgh, the Hon. Mrs. W. H. Johnstone, of a son.

MARRIED.—On the 11th inst., at Paddington, F. Liardet, Esq., Captain in the Royal Navy, to Caroline Anne, widow of the late J. J. Gregory, Esq., R.N.—On the 11th inst., at Cheltenham, E. James, Esq., of Wylam Hall, Northumberland, to Theodosia, youngest daughter of S. W. Parker, Esq., late of Scott's House, Durham—On the 5th inst., at the Cathedral, Limerick, the Rev. R. Knox, Prebend of St. Munchin, in the same Cathedral, and second son of the late Hon. and Ven. C. Knox, Archdeacon of Armagh, to Catherine Delia, daughter of T. G. Fitzgibbon, Esq., of Ballyseedy, county Limerick—On the 4th inst., at St. Helier's, by the Very Rev. the Dean of Jersey, K. Pennefather, Esq., of Gulden, and Knockinglass, county Tipperary, to Jane Catherine Patricia, eldest daughter of T. de Grenier de Fonblanque, K.H., Her Majesty's Consul General in Servia—On the 6th inst., at Wateringbury, the Rev. G. R. Paulson, M.A., Rector of Addington, in the county of Kent, to Fanny, eldest daughter of the Rev. W. Elwyn, M.A., of Wateringbury—On the 11th inst., at St. Andrew's, Plymouth, Captain E. Bond, of Her Majesty's 53d Regiment, to Alethea Duke, second daughter of the late Rev. D. Yonge, of Anthony, Cornwall—On the 6th inst., at the parish church of Willingdon, Sussex, Arthur John, eldest son of J. L. Knapp, Esq., of Alveston, Gloucestershire, to Louisa, youngest daughter of I. Thomas, Esq., of Ratton, in Willingdon—On the 5th inst., at St. George's, Hanover-square, J. Neale, Esq., of Reigate, Surrey, to Mary, second daughter of R. S. Court, Esq., of Dover—On the 11th inst., at Aust, near Bristol, the Rev. J. Vincent, of Jacobstow, Devonshire, to Caroline Lucy, only daughter of the late L. P. Madden, Esq., of Clifton—On the 12th of July, at Colombo, Ceylon, G. Maclean, Capt. R.A., and A.D.C., fourth son of A. Maclean, Esq., of Ardgour, to Amelia Jane, second daughter of His Excellency Sir C. Campbell, K.C.B.—At Beeby, near Leicester, G. Power, Esq., of the island of St. Vincent, to Margery Catharine, daughter of J. Prendergast, Esq., Shamrock Lodge, county Tipperary—On the 6th inst., at Walcot Church, Bath, Sir E. S. Prideaux, of Netherton, in the county of Devon, Bart., to Frances, youngest daughter of the late E. L. Irton, Esq., of Irton Hall, Cumberland.

DIED.—On the 3d inst., at Dunkeld-house, Her Grace the Duchess of Athol, aged 81—On the 12th inst., in Jermyn-street, Lieutenant-Colonel J. C. Hope—On the 14th of June, at Fort Beaufort, Cape of Good Hope, Major E. Molesworth, eldest son of the late R. Molesworth, Esq., of Swords, county of Dublin—Killed in action, on the retreat from Cabul, Lieut. G. W. Cunninghame, 5th Regiment of Bengal Native Infantry, aged 23, only son of the late Major G. Cunninghame, Bengal Artillery—On the 4th inst., at Tunbridge Wells, aged 57, J. Drummond, Esq., Commissary-General; and on the 12th, Cecilia, his wife, having survived her husband only four days—On the 17th inst., J. K. Hewer, Esq., of Balham hill, Surrey, aged 68—On 25th August, at Monte Nero, near Leghorn, at the house of her son-in-law, Baron Brenier, Consul-General of France in Tuscany, Ann Crosbie, relict of the late Hon. C. H. Hutchinson—On the 3d inst., Lieut.-General J. Price, of the Bengal Army, aged 84.

Bradbury and Evans, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the Office, 3, Charles-street, Covent Garden, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, October 15, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 43—1842. SATURDAY, OCTOBER 22. PRICE 6*d.*

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Abies, distinct from the genus Pinus . . . . . . 697 *a*
Acacia, remarks on its treatment . . . . . 693 *a*
Amateur's Garden . . . 692 *c*
Annuals, to bloom in Autumn . 694 *a*
Apples and Pears grafted on the same stock . . . 697 *b*
Apple, Sweeney Nonpareil . 694 *a*
Apples, to keep . . . . 697 *b*
Apples, to roast . . . . 693 *c*
Azalea, double red . . . 695 *b*
Botany, good Works on . . 697 *b*
Calcutta Botanic Garden . . 665 *c*
Cape Bulbs, their treatment . 697 *b*
Carrots, to preserve . . . 693 *c*
Cement for lining open gutters 697 *a*
Conical Boilers, remarks on . 693 *a*
Exhibitors, remarks on their misconduct . . . . 691 *a*
Fern, as food for Pigs . . 691 *b*
Fleas, to destroy . . . 694 *a*
Flowers in religious buildings . 695 *c*
Grapes, diseased . . . 694 *a*
Gray's Botanical Text-Book, rev. . . . . 695 *c*
Greenhouse, small, to heat . 697 *a*
Guano, its effects on Potatoes . 693 *b*
Indigofera dosua . . . 695 *b*
Ivy, its effect on trees and houses 697 *a*
Lonicera flexuosa, its treatment 697 *a*
Manures, Animal, No. 4 . . 692 *b*
Measures of capacity . . 691 *b*
Moths, to destroy the large kinds . . . . . 694 *a*
Nitrate of potash as a manure 693 *b*
Nitrate of soda, to apply to Pelargoniums . . . . 697 *a*
Paris, Exhibition at . . 694 *b*
Pear-trees, to form Espaliers . 697 *b*
Pelargoniums, select . . 697 *a*
Plants for succession in the greenhouse . . . . 697 *a*
Putteridge Bury, noticed . 695 *c*
Roses, hardy . . . . 697 *a*
Roses, to prune . . . . 691 *b*
Salt, its effects on Celery . 693 *b*
Scale, to destroy . . . 697 *b*
Slug-worm, described . . 692 *a*
Strawberry, its treatment . 694 *a*
Summer, proof of its extraordinary warmth . . . 694 *a*
Tomato Ketchup, to prepare . 697 *b*
Trellis for Climbers . . . 692 *b*
Vallisneria spiralis, in the open air . . . . . . 694 *a*
Vine, benefited by autumn pruning . . . . . 691 *a*
Vines, to renovate . . . 697 *a*
Walnuts, to preserve . . 693 *c*
Wasp, to cure its sting . . 694 *a*

SOUTHAMPTON NURSERY GROUNDS.—The attention of Noblemen, Gentlemen, Planters, and the Trade, is respectfully directed to the following List of Transplanted and Seedling FOREST TREES, FRUIT TREES, SHRUBS, &c., which are of the finest quality, and will be delivered by Railway or Steam-vessel in London or coastwise, carriage free. The great extent of these Grounds affording a never-failing supply of every description of Nursery Stock, purchasers, however varied or extensive their orders, may rely on their being executed with despatch and punctuality. Waste Lands planted in any part of the kingdom, by contract, engaging to replace failures, for 3*l.*, 5*l.*, 7*l.*, 10*l.*, and upwards, per acre. Capitalists and Trustees contemplating planting for investment, will find this a safe and desirable means of effecting their object.

SEEDLING FOREST TREES, PER 1,000.	1 year.	2 years.
Ash	1*s.* 0*d.*	3*s.* 6*d.*
Birch	2 0	5 0
Scotch Fir	1 0	2 0
Pinaster	2 6	3 6
Sea Pine (excellent as nurses in exposed situations	5 0	7 6
English Oak,* the true "Durmast" of the New Forest: the largest and most valuable species		7 6
Common Oak	2 6	5 0

If 100,000 of any one kind are ordered, a deduction will be made on these prices.

Raspberries, true Yellow Autumn ditto	8 0 "
Raspberries, Red ditto	8 0 "

Trained Peaches, Nectarines, Apricots, Pears, Plums, Cherries, and Apples, of the most esteemed kinds, as described in the "Fruit Cultivator," by J. Rogers, Southampton, 2*s.* 6*d.*, 3*s.* 6*d.*, and 5*s.* each.

Currants and Gooseberries, 12*s.* 6*d.* per 100.

Vines, 6*d.*, 1*s.*, and 2*s.* 6*d.* each.

Sea-Kale Plants . . .	4*s.* per 100, 8*s.* per 100.
Asparagus do., ...	2*s.* and 4*s.* per 100.
New Victoria Rhubarb .	12*s.* per dozen.

* That there are in this country two distinct species of the British Oak, is well known to those who have carefully attended to their respective qualities—one being red-wooded, the other white-wooded, more generally known in the New Forest as the "Durmast," and considered as the most valuable species, producing timber of the largest dimensions. A knowledge of these important facts led W. R., senr., some years since, to ascertain correctly the means of discriminating between the two species, which were found so well defined as to enable him to collect the seed of the desired kind with unerring precision, and likewise to communicate his observations thereon to the Bath and West of England Agricultural Society, who ordered them to be printed in their "Transactions," and their vote of thanks to be recorded for what they were pleased to term most valuable, and, in a national point of view, important information.

Large Trees, for ornament or immediate effect, may be had of every description, from 5 to 10 feet high.

Priced Catalogues forwarded by Post to applicants stating the size and description of stock required.

WM. ROGERS & SON,
Nurserymen, Landscape-Gardeners, and Contracting Planters,
Southampton.

TULIPS.

W. AND R. LAWRENCE, Hampton, Middlesex, beg to call the attention of Tulip-growers to their CATALOGUE OF CHOICE VARIETIES, which will be *sent free*, on application post-paid.

A SPLENDID SEEDLING PELARGONIUM.

R. JEFFRIES & SON beg to call the attention of the Public to their Seedling Pelargonium, Albert Prince of Wales, which they intend sending out in Nov. next, in strong plants, at One Guinea each. The colour of the lower petals is a fine deep rose pink, upper petals having an immense large dark maroon spot, with a distinct broad pink margin, excellent trusses; flowers very large, beautifully cupped, good form, and of superior habit. Has been seen during the season by many first-rate cultivators, who have pronounced it a distinct and desirable variety. A remittance is respectfully requested from unknown correspondents.—Ipswich Nursery, Oct. 13, 1842.

PRINCE ALBERT PEA.

CORMACK and OLIVER, SEEDSMEN and NURSERYMEN, New Cross, near the Croydon Railway Station, and Bedford Conservatory, Covent Garden, London, have the honour to offer to the notice of Noblemen, Gentlemen, and others, the above new PEA, as one of the earliest and best sorts extant; in proof thereof, a quantity put into the open ground on the 14th of March last was ready for use the 25th of April following, being only *forty-two days from the period of sowing to the date of gathering for the table*; it is moreover a good bearer, of excellent flavour, and highly advantageous for early forcing. —Packets, containing a quart, 5*s.* each.—September 30, 1842.

TANSLEY NURSERY, NEAR MATLOCK, DERBYSHIRE.

JOSEPH SMITH returns grateful thanks to his numerous friends for past favours, and begs to invite Noblemen, Gentlemen, and others, who may be improving their grounds, to his extensive and well-grown Stock of Forest Trees, Flowering Shrubs, Evergreens, Standard and Dwarf Roses, American Shrubs, &c. &c.

J. S. also begs further to state, that he has on hand upwards of 400,000 Transplanted Larches of various ages and size, stiff growers, and excellent Roots; 300,000 Transplanted Quicks, three, four, and five years old; 40,000 Common and Portugal Laurels; 30,000 Evergreen Privets; with many thousands of fine Rhododendrons for Cover and other Planting; and all other Nursery Stock in proportion.

Catalogues with prices may be had on application.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WILLIAM WOOD & SON beg leave to inform their numerous Patrons, and Rose Amateurs in general, that their NEW CATALOGUE OF ROSES, for the present season, is now ready for distribution, and will be sent, GRATIS, on application.

The immense Stock of Roses at Maresfield are this season finer and more luxuriant than ever; no pains or expense have been spared to render the collection as rich and unique as possible.—Also Trees and Plants of all kinds packed with the greatest care for exportation.

The General Catalogue of Nursery Stock and Trade List of Roses, &c., are ready for distribution.—Sept. 21st.

J. SHEPPARD, NURSERY AND SEEDSMAN, WINCHESTER, begs most respectfully to call the attention of the Trade, and the Public generally, to the undermentioned articles, being such as he can fully recommend to give satisfaction:—Sheppard's Duke of Wellington Pelargonium, Sheppard's King David ditto, Sheppard's Isabella ditto, 10*s.* 6*d.* each; Sheppard's Queen of Beauty Pink, a fine Seedling raised in 1841, a first-rate Show Flower, 5*s.* per pair; White's Prince Albert Verbena, a splendid vivid scarlet, superior in colour to anything ever offered, price 2*s.* 6*d.* each plant.—Agents: Messrs. Warner and Co., Seedsmen, 28, Cornhill, London.

J. S. has on hand a fine Collection of Pinks, from 1*s.* per pair. October 1st, 1842.

MESSRS. DICKSON, NURSERYMEN AND FLORISTS, Acre Lane, Brixton, beg to inform Amateurs and Florists, that their Catalogue of Carnations, Picotees, Auriculas, &c., is now ready, and may be had on application to them, or Messrs. Warner and Warner, Seedsmen, &c., Cornhill, London.

MICHAEL BREWER, Nursery, London-road, Cambridge, begs respectfully to call the attention of the Nobility, Gentry, and the Public to that invaluable new Strawberry, the EMPEROR. It is a strong grower, a great bearer, and has a fine flavour, with large scarlet fruit superior to Keen's Seedling, with the great advantage of being ripe a fortnight earlier.—Fine strong plants are now ready at 30*s.* per 100.

Brewer's perpetual scarlet-flowering BRITANNIA Pelargonium, dwarf habit, dark-green foliage, and the brightest scarlet grown, 12*s.* and 18*s.* per doz. Strong-flowering Plants of RUSSIAN VIOLETS, 4*s.* per doz. Brewer's fine early hybrid SEEDLING RHUBARB, from the Siberian, not surpassed for earliness and flavour, strong Roots, 9*s.* per doz.

M. B. has also a large Stock of IRIS SUSIANA and splendid mixed PERSIAN IRISES to dispose of.

CINERARIA, the "GEM."—Decidedly the greatest acquisition to this most pleasing family of Plants ever offered to the Public, and admitted, by all who have seen it, to be the finest edged variety in cultivation. The colour is of the purest White, beautifully contrasted with a deep edge of Cherry colour, to the depth of one-third of the petals. The Flowers perfectly round, without any space between the petals; good size, and fine shrubby habit. Strong Plants are now ready for delivery, 7*s.* 6*d.* each.

Orders are solicited by W. J. Ward, Seedsman, Hull. A reference or remittance required from unknown Correspondents. No Discount unless four Plants taken.

GLADIOLUS CARDINALIS.

A. MACKENZIE begs to intimate that he has Seed of the above splendid and admired Flower, which he has saved this autumn, in packets at 1*s.* and 2*s.* each, which will be sent free to any part of Britain; also Bulbs, at 2*s.* per doz.; and by adopting his mode of culture, which will be found in Numbers 34 or 35 of the *Chronicle*, they will be able to stand our winter without any protection.—Blair Adam, N. B., Oct. 14.

J. D. PARKES has a fine New Variety of LABURNUM, of a vigorous growth, and pendent habit, racemes of flowers frequently 15 inches long; flowers more numerous and deeper yellow than the common. Dr. Lindley has given a favourable account of it in his Paper, 5th Feb., as a well-marked variety. Price 10*s.* 6*d.*; or the whole stock of plants, upwards of 30, for 15*l.*

A beautiful CINERARIA, large, bright purple, 2*s.* 6*d.*; a good white (this not yet sold out), at 5*s.*, or 2*l.* 2*s.* for the stock.

Good Seedling RHODODENDRONS, from 4*s.* to 6*s.* per 100.

Fine Standard and Dwarf APPLES, best varieties, at 1*s.*
Ditto Ditto PEARS, from 1*s.* 3*d.* to 1*s.* 6*d.*

Good Dwarf TRAINED PEARS, at 3*s.*

Dartford Nursery, Dartford, Kent.

SPLENDID ERICAS (HEATHS), EPACRIS, BORONIAS, &c., &c.—J. and J. FAIRBAIRN, in gratefully ackowledging the kind and very liberal patronage they have been favoured with, beg leave most respectfully to solicit the attention and inspection of their friends and the public to their very large and exceedingly healthy Stock of the above highly beautiful tribe of PLANTS, which they flatter themselves are not to be surpassed in the kingdom; and which, from the extent of their stock, they are enabled to offer upon the following very advantageous terms:—

100 fine flowering plants, including 75 Ericas, 20 Epacris, and 5 Boronias. The baskets and packages of the Ericas will consist of the most popular and esteemed kinds—Ampullacea, Ampullacea rubra and elegans, Tricolor, Tricolor superba and elegans, Eximia, Hartnelli, Ventricosa, Ventricosa superba, Globosa, Stricta and Purpurea, Depressa, Vernix ovata, Westcottii, Willmoreana, Vestita, Hyemalis, Formosa, Mirabilis, Pattersoniana, Picta, Sulphurea, Viridiflora, Intermedia, Mammosa, Linnæana superba, Linnæana curvæflora, Humeana, Banksiana, Sanguinea, Daphnoides, Blanda, Jasminiflora alba, Donnei, Cliffordiana, Rubra, Cerinthoides, Cerinthoides magna, Grandinosa, Verticillata nova, Persoluta rubra, Boweana, Exsurgens coccinea, Echiiflora, Cruenta, Sulphurea, Blandfordia, Trossula, &c., &c., &c. The Epacris will contain Impressa, Impressa pallida, Campanulata alba and rubra, Variabilis, Nivalis, Onosmæflora major, Pulchella, Grandiflora, Pungens, and Purpurascens, &c., &c., for £7 10

75 Fine Flowering Plants from the same Choice Selection			6	10
50	do.	do.	do.	5 0
25	do.	do.	do.	3 0

For the convenience of those Cultivators who are only desirous to add a few gems to their collection, J. and J. F. beg to offer the following very choice and rare Ericas, 12 plants, package included, for 3*l.*: Aristata, Massoni, Gemmifera, Macknabbiana, Inflata, Shannoniana, Tricolor, two beautiful new Varieties, Elegans, Cavendishii, Ampullacea vittata, and Ampullacea. No. 1, a beautiful new Hybrid variety.

J. and J. F. beg to acquaint their Friends and the Public, that their collections of Fuchsias and Verbenas contain all the best varieties in cultivation, and that, having large stocks, they are enabled to offer them at very moderate prices.

J. and J. F. beg leave also to inform their Friends and the Public, that their stock of Fruit-trees, Standard and Dwarf, Trained and Untrained (of the most genuine kinds), Evergreen and Flowering Shrubs, American Plants, Standard and Dwarf Roses, are particularly fine this season, and very extensive. Early demands will receive their prompt and most careful attention, and be much esteemed.

All orders they may be favoured with packed upon the most approved principles, and delivered free of charge in London.

N.B.—A remittance or reference required from unknown correspondents.—Nurseries, Clapham, near London, Sept. 15, 1842.

JAS. CUTHILL has the following Collection of CHOICE SEEDS:—Lisianthus Russellianus; the splendid new Spotted Digitalis, which gained a medal at Chiswick in June; Splendid Scarlet Phlox Drummondi; Cuthill's Early Melon, with printed directions—it ripened 72 Melons in a 12 light-pit, within two months after planting; his Black Spine and Snow's Cucumber, bearing at the rate of 2000 for every 12 lights for the whole season—any of the above at 2*s.* 6*d.* per packet; also a fine Ridge Cucumber, at 1*s.* per packet; a German Vegetable Marrow, very fine flavoured, 3*d.* a seed. On the receipt of a Money Order any of the above will be sent Post-free. Fine bushy Plants of the Lisianthus Russellianus.—Direct JAMES CUTHILL, Florist, Denmark Hill, Camberwell.

SPLENDID NEW PELARGONIUM, CALCEOLARIA, &c.

JOHN HANCOCK & SON, Seedsmen and Florists, 218, Gilligate, Durham, beg leave to offer to the notice of their Patrons, Friends, and the Floricultural world in general, the following New Varieties of Pelargonium and Calceolaria, &c.—Plants of which will shortly be ready.

PELARGONIUM.—HANCOCK'S NORTHERN BEAUTY.

DESCRIPTION.—Lower petals a beautiful pink terminating with a white centre, upper having a large, rich, well-defined spot, which gradually softens towards the edge. The flower is of good substance, finely formed, large size; the petals round, broad, and firm; good trusser, blooms freely, and of fine habit; flowers above the foliage. Bears some resemblance to the Nymph, but is a decided improvement on that favourite flower. Warranted to be a desirable variety, and to prove an excellent sort for showing. Price per plant, 42*s.*

CALCEOLARIA.—HANCOCK'S MISS E. JACKSON.

DESCRIPTION.—Ground colour orange, spotted with crimson, throat also spotted; upper lip yellow, slightly tipped; colours bright, of very large size, and excellent shape. A first-rate and beautiful variety.

CINERARIA.—VIOLACEA SUPERBA.

DESCRIPTION.—Of a very intense blue colour, quite distinct, and will prove a great acquisition to this handsome tribe of plants. Was awarded an extra prize at Durham in August last. Price per plant, 5*s.*

☞ No Allowance to the Trade except for the Cineraria.
